

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

Wir bitten Sie um Einhaltung folgender Richtlinien:

- + *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.
- + *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.
- + Beibehaltung von Google-Markenelementen Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.
- + Bewegen Sie sich innerhalb der Legalität Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.

Über Google Buchsuche

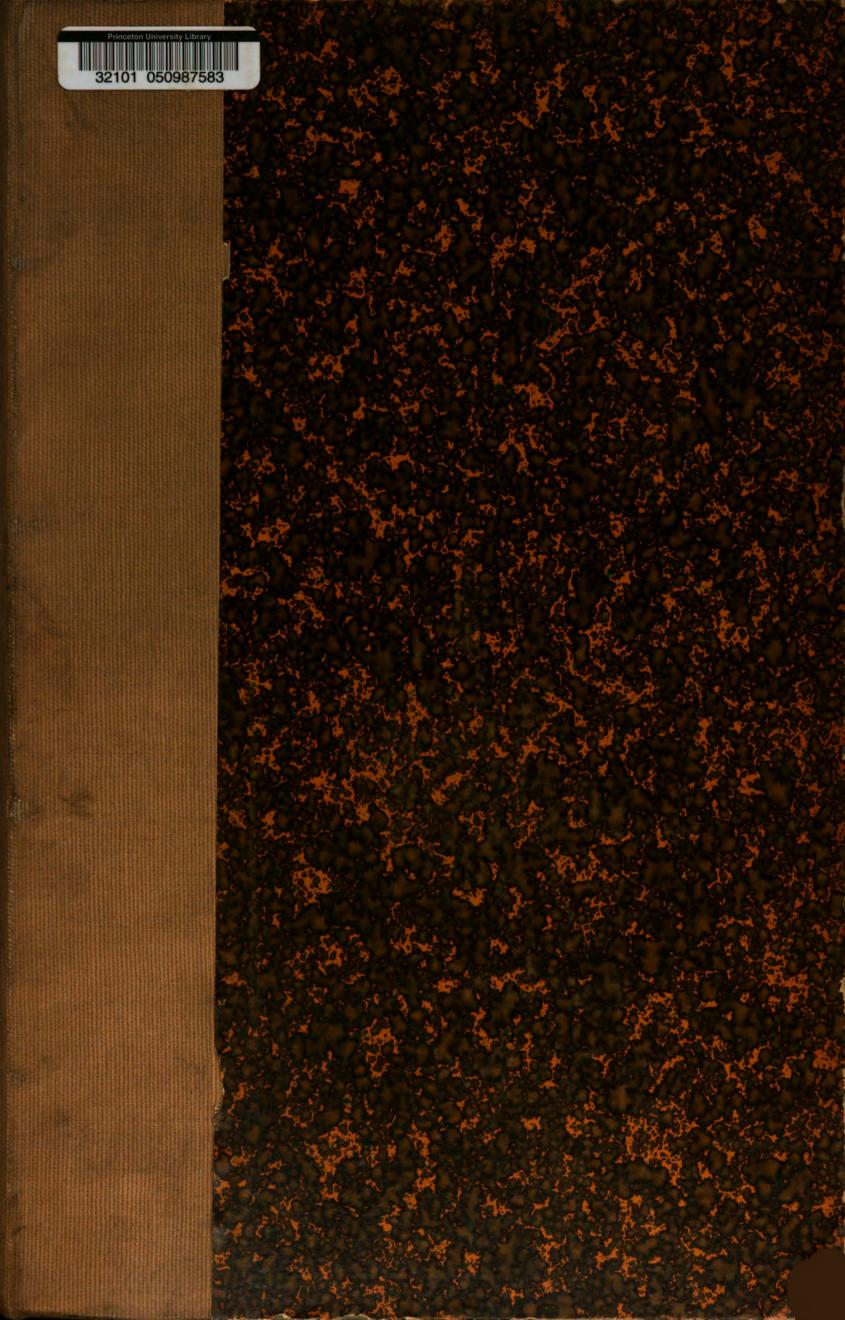

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter http://books.google.com/durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

THE

ELECTRICAL REVIEW.

Vol. LXXVI.

JANUARY 1 — JUNE 25, 1915.

LONDON:

H. ALABASTER, GATEHOUSE & CO., 4, LUDGATE HILL, E.C.

Gondon:
Published by the Proprietors,
at 4, Ludgate Hill, E.O.

INDEX.

Use of minimarkings:—Authors, Barkruptcy Proceedings, City Notes, Contracts Closed and Open, Correspondence, Institution and Lecture Notes, Legal,
Libering and Power Notes, Liquidations, New Companies, New Electrical Devices, Fixtings and Plant, Obstoder, Oppicial Returns, Var Items,
Proceedings of Societies and Institutions, Prospectures, Railway Notes, Reviews, Telegraph Notes, Telegraph Notes, Telegraph AUTHORS CONTINUES.

Stigant, S. A., and J. L. Thompson, on High-voltage dangers present in static transformers due to electrostatic capacity of the windings, 25, 36

Surveyor, A., on Utilisation of water-power, 493

Taylor, F. H., on The electrical equipment of a country house, 339

"Teacher, A," on Technical teaching as a profession, 68

Thompson, J. L., and S. A. Stigant, on High-voltage dangers present in static transformers due to electrostatic capacity of the windings, 25, 36

Tofield, H. C., on Modern wiring work, particularly in bad situations, 188, 204, 304

Turner, L.B., on Wireless call devices, 817

Watts, T. G., on Electric bell signalling in collieries, 30

Weaving, R., on Electric heating and cooking, 290

Webb, C. J., on Will the ignition magneto be superseded? 311

Wedmore, E. B., on Automatic protective switchgear for alternating current systems, 37, 32, 458

Willox, F. W., on The practical rating of electric incandescent lamps, 457

Willox, W., on Cab signals on British railways, Main-motor-starting switchgear used on modern German submarines, 77

Automatic protective switchgear for alternating-current systems, by E. B. Wedmore, 37, 92, 458

ACCIDENT, 895

Accident, Lift, 836
Accident, Lift, 836
Accident, Singular electric blasting, 116
Accident, The Cardiff, 509
Accident, The Liford railway, 439, 461
Accidents, Automatic-lift, by F. Broadbent, 681
Accidents, South African winding, 67
Accitylene corrosion, 794
Advertisement and character, On, 4
Advertisement and character, On, 4
Advertisement and character, On, 4
Acrial wire ropeway for automatic disposal of ashes, 502
Almedabad, India, Electricity supply
at, 685

Australian arailway scheme, 632
Australian arailway and with, 547
Australia, Rail manufacture in, 72
Australia, Trade statistics of, 39

Acfield. W. C., on Main-line signalling on rallways, 565, 599

Ackermann, A. S. E., on Utilisation
of solar energy, 675

Ayton, F., on The use of electric vehicles in municipal services, 904

Baker, C. A., on Load factor output and cost, 775, 808, 841

Ball, A. E., on Wireless control of public clocks, 539, 634, 713

Beaver, C. J., on Cables, 230

Beage, R. S., Prof. M. Maclean and D. J. Mackellar, on Distribution and rise of temperature in field coils, 279

Bennett, E. P., on Publicity—The soul of business, 674

Blackman, A. S., and T. Roles, on The practical result of the Point Five tariff, 853, 903

Boothman, L., on Potentiometer resistance, 497; on The rhoostatic control of separately generators, 678

UTHORS—continued.
Boulding, R. S. H., and Dr. S. P.
Smith on The shape of the pressure wave in electrical machinery,
195
Broadban,

Broadbent, F., on Battery-charging for electric vehicles, 467; on The National electrical code and British wiring rules compared, 121, 134; on The National electrical code revised, 643 Carter, T., on Some notes on shunt regulating resistances, 716, 752, 300

compared, trical code revised, 643
Carter, T., on Some notes on shunt regulating resistances, 716, 752, 800

"Commercial," on Workers' carnings and the war, 306; on The fight in the factory, 609
Cooper, W. R., on Electrical driving in the woollen trade, 6
Denny, C. W., on Searchlight projectors, 348, 413
Dickinson, A., on Bombay hydroelectric scheme, 657, 707, 780
Digby, W. P., on Scientific and technical commissioners, 819
Dykes, A. H., on Private generating plant, 531
Fart, A. V., on The lubrication of ball bearings, 633
Fleming, A. P. M., on Training for the industrial side of ehgineering, 337
Foley, L. B., on Train dispatching by wireless, 602
Foster, L., on Breakdowns in colliery electrical plant, 198
Gumaer, P. W., on Economic operation of electric ovens, 871
Hollis, E. P., on The case for the electrification of flour mills, 123; The case for the electrification of mills, 123; The case for the electrification of nengineering works, 537:
The case for the electrification of sheets for electricity works, 263
Jeffrey, C. S., on Temperature measurement in a modern power house, 523
Mackinney, V. H., on Good fighting and its effects, 610
Maclean, Prof. M., D. J. Mackellar, and R. S. Begg, on Distribution and rise of temperature in field coils. 279
Marchant, Prof. E. W., on Conditions affecting the variations in strength of wireless signals, 267
Mayock, W. P., on Some peculiar views on electric light switching, 711
Meares, J. W., on Hand regulation of a hydro-electric plant in India, 275
M. L. A. de," on The-trade of S.

Meares, J. W., on Hand regulation of a hydro-electric plant in India, 275

"M., L. A. de," on The electrical trade of Siam, 241

Munro, D. S., on Modern methods of electrical wiring, 966

Nicholson, J. S., on The magnetisation of iron, 109

Powell, S. M., on Rational rating finament lamps, 631

Preece, W. L., on Telephone troubles in the tropics, 508, 561, in The power supply of the Central Mining-Rand Mines group, 585, 633, 670, 705, 745, 779

Robertson, T. D., on Electric steel-

Automatic protective switchgear for alternating-current systems, by E. B. Wedmore, 37, 92, 456

B ADGES, War Office contracts and workers', 591
Bagdad, 75, 177
Bakery, A Canadian electric, 553
Ball bearings, The lubrication of, by A. V. Farr, 638

EDITION 1915

IN PREPARATION.

H. Alabaster, Gatehouse & Co., 4, Ludgate Hill, London, E.C.

1914.

THE extraordinary circumstances under which we take in hand our review of the past year present a startling contrast to the conditions which prevailed 12 months ago. At that time there were signs of a falling-off in the general trade of the country, but we considered that this circumstance of itself did not justify apprehensions concerning the course of the purely electrical industry. The field for electricity, both at home and abroad, was regarded as practically unlimited and inexhaustible, and certain to present abundant opportunities for years to come. For a period of seven months that followed there was great activity in the factories, and everything seemed to point to 1914 being a record year, with a big volume of business and less strenuous competition, when the awful calamity of war between the Great Powers of Europe shook world finance and world industry to their very foundations.

In the early months of the year there was serious trouble in the Labour world; the struggle in the building trades and the disaffection among electrical workers occupied a good deal of thought, and at one time threatened to entangle the central station employes. But the catastrophe of war led to the making of peace within our own borders, and masters and men have patriotically put aside their disagreements the while they show a solid front to the common enemy of liberty and civilisation. It will go down to history as one of the first and greatest consequences of the outbreak of war that political and industrial strife was hushed. Class had been arrayed against class, and even sex against sex; Labour was relentlessly at war with Capital. and Unionist labourer was increasingly bitter against non-Unionist. Such was the position early in the year. The atmosphere was speedily changed as it became recognised in every stratum of society that there was an imperative national call for a union of all forces in the Empire in defence of our common heritage and interest.

It is not wise to attempt to prophesy, but it seems inconceivable that after the experiences, sacrifices, and new problems that these five months have brought to all the nations involved, political and industrial differences can ever again, or at any rate for many years, be treated in the same heated and acrimonious spirit. The scribes who several years ago edified us with their answers to the question: "Whither are we tending?" would probably wish to reconsider their speculations in the light of recent events, for the chastening of society from top to bottom, the new and closer relationships between certain nationalities. the birth of a new Germany, and the pursuit of new and higher ideals among all peoples, may be expected to characterise the years that follow the cessation of hostilities. But the war is far from finished, and there is no suspicion of millennial horizons—the year that opens to-day will make heavy demands upon all branches of the Services, and not least of all the industrial services, for the United Kingdom must needs be the workshop of the Allies, providing war material to the utmost of its productive capacity. It is this class of activity in electrical engineering works, coupled with the absence of such large contingents of skilled labour with the military forces, which renders the outlook for 1915 from the purely electrical standpoint one of some dubiety.

Reviewing the past year from a technical point of view, up to the end of July the normal course was followed—including the placing of not a few important orders with German firms. The most notable event in the lighting world was the marketing of the half-watt lamp in January

by the group of companies which control the tungsten lamp manufacture; fortunately—for violent changes in practice are harmful and may even prove disastrous to small concerns and individuals—the new lamps were available only for high candle-powers or for low voltages, and the disturbance caused by their arrival, of which full warning had been given, was comparatively small. That they provided a most welcome stimulus to electrical development in certain directions cannot be doubted; for example, it is recorded that tradesmen who had resisted the attractions of other illuminants for the external lighting of their shop fronts were unable to withstand the charms of the newcomer; numerous installations of street lighting were carried out, for which the arc lamp was too large a unit and the ordinary tungsten lamps showed too small a margin of economy to justify the conversion from gas; and in many large halls, shop interiors, &c., they were found to effect a great improvement.

In the heating and cooking field steady progress has been made towards the perfecting of the apparatus, and the extended guarantees now given by some makers afford convincing testimony to the improvements that have been effected in the construction of the heating elements. Some entirely new types of apparatus were introduced, and certainly the conditions to be met are now much better known and more adequately provided for than they were a year ago; but all the technical advances made are still insufficient to account for the extraordinary development in the popular appreciation of, and demand for, electrical cooking and heating. Where energy is to be had for 1d. a unit or less, the success of the former and its ability to compete with gas cooking are well established; but no one attempts to maintain that electrical heating, under ordinary conditions, is economical in comparison with gas or coal heating as regards the actual cost of fuel or energy, and therefore, in order to account for the remarkable demand for electric radiators which has been observed during the year, it is necessary to assume that the advantages inherent and peculiar to electric heating, such as portability of the radiator, perfect cleanliness, freedom from fumes and fire risk, and ease of control, far outweigh the consideration of running cost. The rather startling figures given by the President of the Institution of Electrical Engineers and various supply station engineers, as to the growth of the heating and cooking load, are corroborated by the undoubted activity that exists amongst the manufacturers of the apparatus, and it is clear that the conditions which we have pointed out as necessary to the rapid improvement of the appliances and the reduction of their cost—namely, a large output and an assured demand—are now in course of practical realisation. Moreover, it is unanimously reported that the diversity factor of this class of load is such that it has not appreciably increased the peak due to the lighting load.

The use of electric power has developed along normal lines; the application of electric driving to mines and to textile industries in particular has made good progress, its superiority in both departments to all other agencies being no longer a matter for argument. The installation of electric winders, it is true, remains exceptional, but this, we believe, is due entirely to local conditions, especially to the prior installation of steam plant at existing collieries; where a new pit is sunk, the electric method of winding can be adopted without hesitation. The steadily increasing adoption of the electric hand lamp in coal mines is also worthy of mention; we confidently anticipate its universal use in this connection.

In central station practice the most marked feature of recent times, perhaps, has been the definite decision that for large undertakings high-pressure three-phase transmission to sub-stations is pre-eminently the best method to adopt. In special cases the high-pressure direct-current system championed by Mr. Highfield may prove to be the more desirable, but for urban areas the three-phase system reigns supreme. This is not a matter of the past year alone, but during the year several new examples have matured and others have been launched. Various projects of this kind of the first magnitude are now in progress, such as those of Manchester, Liverpool, Glasgow, &c., in each of which the main distribution is on the D.C. system. The new generating station at Manchester bids fair to become the largest in the

kingdom, and as this city has led the way in adopting turbines of 15,000 kw., so it will continue to maintain its lead by installing sets of 25,000 kw. The rapid and continuous progress made in supply-station practice has necessarily brought the question of obsolescence into prominence of late years, and it is now generally agreed that this is a very important factor in the supply economics of the present day. The excessive periods for repayment of loans that were sanctioned by the London County Council in its unregenerate days are now seen to be absurdly and dangerously extended, and the Council has lately endeavoured to introduce reforms even in respect of existing loans, suggesting that loans for plant granted for 42 years should be paid off in 15 years.

In the provinces the extension of areas of supply has occupied the attention of both companies and municipalities; while the old antagonism between these parties has been greatly modified, there still remains a considerable amount of jealousy on the part of the latter, and the concentration of supply which is hoped for in technical circles remains a dream of the future, except in the case of the great cities, many of which are seeking to supply their small neighbours. The use of overhead mains, on the part of both municipalities and companies, has made good progress, and the Board of Trade has manifested a growing measure of sympathy with its advocates. The disposition of several gas companies to undertake also the supply of electricity is a sign of the times. Closer attention has been given to the lighting of small property, with very promising results.

The complete electrification of the new dock at Hull was

a noteworthy item of the year's achievements.

Amongst minor technical movements may be mentioned the progress of the Ljungström turbine, higher speeds for turbines, and the wider use of reactances, wet air filters,

and suction ash-handling plant.

As we anticipated last year, the question of the future supply of electricity to London has assumed a prominent position; the report of Messrs. Merz and MacLellan to the L.C.C. opened up new lines, along which the Council decided to move, with the object of combining the advantages of municipal ownership with those of company management. The question is now before Parliament, where, no doubt, it will be thoroughly thrashed out in Committee. The Council's Bill has not been favourably received by either the Metropolitan Borough Councils or the companies—some of the latter, indeed, are promoting a scheme of their own; but opposition at the present stage need not be regarded very seriously—it is the only way to secure the best terms for the professed opponents.

Another matter before Parliament is the I.M.E.A. Bill to confer additional powers upon municipalities; this is mainly interesting on account of its influence upon the relations between the supply station managers and the electrical contractors. The latter, rejecting the compromise offered them, which at least might have formed an admirable basis for negotiation, are opposing the Bill with tooth and nail, but we trust that when the issue is joined they will see fit to make terms and put an end to the conflict, which we believe is only kept alive by the irreconcilability

of a few members on either side.

In the field of electric traction the progress of the railless system has been maintained, and a new factor—the electric 'bus—has entered the arena. There have been electric 'buses and electric 'bus companies before, we know—only too well—but the conditions are now changed, and we hope to see notable developments in this direction in the near future. The possibilities of the commercial electric vehicle have been at last brought home to the supply engineers, and the Electric Vehicle Committee, formed in 1913, has done splendid work in popularising it and paving the way to its general adoption. Already over 100 vehicles are in use, and giving undoubted satisfaction. There is scope for an enormous development in this field.

The steam railway companies are at last taking very definite steps towards the electrification of their suburban services, and several important projects are in progress in the metropolitan area, as well as in the North of England and in Australia and Argentina; there, however, are but the commencement of a revolution which will provide an enormous amount of work for British electrical firms.

In tramway circles the most noteworthy event of the year perhaps was the failure of the immense system of the London County Council to meet its obligations without recourse to the reserve fund, owing to the severe competition of the motor-omnibus; similar troubles were experienced to a less extent by all the electric tramways in the metropolitan area, whereas in provincial cities the tramways prospered. Since the outbreak of war, however, the conditions have materially changed; the pressure upon the London tramways has been relieved by the dispatch of large numbers of omnibuses to the front, while, on the other hand, the provincial tramways have suffered from severe depression. Drastic measures have been proposed at Manchester and Liverpool to deal with the congestion of traffic in the central areas. Interruptions of service on the L.C.C. tramways in the spring, and again in December, accentuated the undesirability of depending entirely upon one source of supply for so extensive and important a system.

The declaration of war between this country and Germany August exerted a most important influence upon the whole of the industry. Some of the largest works were called upon to devote their whole output to the service of the Government, and at the same time the influx of electrical goods from the Continent came almost to a full stop. On the other hand, large numbers of men were called up to the Colours as Reservists or Territorials, and many others joined the new Army, including a large proportion of skilled men whose services are very seriously missed; indeed, it is a question whether the Government would not have been well advised to forbid the enlistment of skilled workmen at the start, as it practically did in the autumn, for the manufacture of munitions of war, motor vehicles, equipment, &c., is of the first importance. Electrical manufacturers thus found their operations severely hampered at a time when an increased output was imperatively called for. However, every effort was made to cope with the exceptional conditions, and the steady inflow of raw materials rendered possible by our command of the sea has prevented any difficulty on that score. general feeling amongst British manufacturers, as shown by their replies to inquiries which we addressed to them, was one of cheerful optimism, and it appears to be widely believed that the tide is flowing in our favour, not only on the field of battle, but also in the industrial warfare in which we are engaged. The cry in both cases is for more trained men; and men cannot be trained in a day.

The achievements in the telegraph and telephone departments and in wireless have been of no mean importance, but we must defer reference to these and perhaps some other matters to a later issue. From what we have said it will be obvious that, notwithstanding the war, the year 1914 was one full of technical and industrial interest, and that under normal national conditions the result would have been such as to justify general feelings of satisfaction.

Death has removed from the electrical world two men whose names had become household words on both sides of the Atlantic—Sir Joseph Wilson Swan and George Westinghouse. The passing of Robert Kaye Gray has made a vacant place in many hearts which no other can ever fill; A. Bruce Anderson, chairman of the B.E.A.M.A., a man of commercial enterprise and ambition, met with a premature end in the *Empress of Ireland*; and other outstanding losses have been experienced by the deaths of Professors E. J. Houston, Minchin and Poynting, Augustus Stroh, Paul Heroult, J. Gott, A. R. Sillar (Pekin), R. Hope Jones, and S. W. Newington. Captain Lord Guernsey, killed in action, Lord Suffield and Lord Merthyr, all had financial and other interests in electrical or allied industrial concerns.

THE A.E.G. ON THE WAR.

ONE of the most extraordinary speeches which have yet been delivered in regard to the war and the possible future course of events was made by Dr. Walter Rathenau at the Berlin meeting on December 10th of the shareholders in the Allgemeine Elektrizitäts Gesellschaft. Certain Swiss reservists who have been recently permitted to leave the field and resume their former occupations, subject to the liability of again being called to the colours in connection with the protection of the Swiss frontiers, declare that the Germans are confident of victory, a sentiment which also characterised the address of the chairman of the Berlin company in question, and received the very warm approval of the shareholders. This question, however, is of considerably less importance from an electrical point of view for the moment than is the general situation of this industry in Germany, and of the A.E.G. in particular, at the present time, and it will, therefore, be of advantage for the trade in Great Britain to hear the Tentonic point of view as set forth at that meeting.

According to the German newspapers, Dr. Rathenau stated that the Germans were living in an economic situation which was quite unusual, and which could not be compared with any previous economic experience. The Continental blockade at the beginning of the last century was child's play as contrasted with the great restriction which has now been forced upon the Germans. Hitherto German industry has existed to a far-reaching extent on imports and exports; its first duty now has been to depend upon itself, and this problem, in his opinion, has been solved in a surprising manner. In explanation of this statement the speaker re-In explanation of this statement the speaker remarked that a large portion of German economy served directly or indirectly for the defence of the country, and for that purpose a transposition of the whole ex n mic mechanism was requisite- a change without a parallel, and for which only a few months were available. A country which has provided out of itself inland compensation for the large deliveries from abroad, upon which it was dependent, is considered to deserve immense recognition in an economic respect, and the A.E.G. is claimed to have succeeded in this achievement. At present the company is producing many articles of which no one previously thought, whilst many other operations to which a large portion of its forces was formerly devoted are no longer being carried out. chairman believes that German economy will persevere in this capacity for effecting changes, and that the new method will continue to stand the test during the duration

Let us now see what idea prevails as to the future. On this point, Dr. Rathenau remarks that when the war is over and the reconstruction of economy becomes necessary the problems which will come forward will be considerably more difficult, alth ugh he expresses the hope that the work of reconstruction will be accomplished under other and much more brilliant prospects than the Germans have ever experienced; but the problems will be very serious and will requisition the whole of the forces of the economic life. If it is considered what the cost of the war is to Europe, that the expenditure for the European market far exceeds £5,000,000,000 per annum, that this sum must be recovered, and that many relations with other countries will be broken up-if these facts are considered the result is that the economic life will be confronted with problems such as have never been known. The presumption for this was of a political kind, and they were deeply convinced, the chairman observed, that under no circumstances could victory be withheld from the Germans, an observation which gained the lively approval of the meeting. He was, however, of opinion that there was something else to be acquired: ascendency which was manifested in victory, and which economically must amount not to the length of one horse, but to that of one hundred horses. What is implied by this phrase is not quite obvious, but it is probably explained by the subsequent assertion that peace cannot be bought, but must be dictated by Germany, and that that can only take place when the enemies of the country are subdued in the old Roman sense.

The question of the duration of the war next engaged attention. The chairman, whilst being unable to commit himself on the matter, stated that the news from the East made it appear as if there was some foundation for the hope of a short war, but he declared that it was necessary also to expect a long one, and in that event German economy had

to prepare itself for the task. The adversaries r.ckon that German weakness lies in this direction, but Dr. Rathenau observes that they will make a mistake in this matter. long war presupposes just as strenuous a struggle in economy; this struggle will be just as successful, and even a war of long duration will be endured by Germany. How will this be done? The chairman states that the Germans, in the first place, have the capital, which has been accumulated in the past 30 years, and that if the nation had remained of an agricultural character as in 1870, instead of having become an industrial country, it would have been impossible to carry on the present war. Admittedly the industrialisation of the country has been good; it has enormously strengthened its resources. The best means of defence, however, are considered to be represented by the man and his moral value -a value which has never been lacking in German technics and economy. Dr. Rathenau further remarked that the Germans knew that their technics would also take up and solve the problems of the day. Thus, in the whole situation, the A.E.G. had endeavoured to force its equipment as high as possible, and had transferred its technical arrangements to other branches. conclusion, the chairman stated that the Germans had confidence in success and in the strength and the moral services of the country, and for these reasons their hope was strong and immovable.

The extraordinary speech of Dr. Rathenau, as representing such an influential company as the A.E.G., will doubtless be considered with interest in electrical circles in this country. Although the chairman refrained from specifically informing the shareholders of the exact changes in production which have been made in certain departments, it is obvious that the alterations can only refer to the substitution of war materials for articles of peace in so far as war materials were not previously made But the A.E.G. is not alone in this by the company. respect, as various iron and steel companies, finding that their trade in certain departments has been brought to a standstill, have also embarked upon the manufacture of war moterial in order to assist in meeting the demand. when Dr. Rathenau speaks of the probability of German economic endurance for a long war, he omits to mention the very important fact that, apart from the comparative scarcity of certain ores for making hematite pig-iron for the production of the particular quality of steel that is required for armaments, there is an ever-increasing dearth of the non-ferrous metals—copper, nickel and aluminium—which are also needed for the purposes of the war. As it will be exceedingly difficult to procure any further supplies from outside the country, it is probable that the peculiar economic conditions which have already been set up by the circumstances just referred to will play an important part in bringing the war to a conclusion.

THE market for lead has been rather variable during the last few weeks. There was considerable strength shown at times, and a level of £19 5s. was established and retained for some time for prompt metal, all the early deliveries being under efficient control, while large demands were being met with from Russia, to say nothing of the excellent position of the ammunition makers here who were taking large supplies regularly for Government needs. The anticipated closing of Archangel has not yet come into effect, but it cannot be delayed much longer no matter what efforts are made to keep open the port, but while this may check Russian buying in the London market and stop shipments from here to Archangel, Russian demands will then be diverted upon New York. Already business has been done for shipment from America to Vladivostock, and unsuccessful efforts have actually been made to ship lead in cargoes direct from Spain to that

It is quite clear that the cost of transport is not going to be any hindrance to Russia getting everything needed for

the pursuit of war against the Huns. In considering the effects of the war upon the demand for lead, it may be remarked that according to the German papers consumption in that country has increased owing to war requirements, and prices have advanced considerably. The latest news available as to lead there is to the effect that something like 575 marks per metric ton is the price, and if this is correct it betokens a serious scarcity of the metal in That country normally imports a good deal of lead, say, about 100,000 tons a year, and the cutting off of s) large a quantity cannot be expected to pass unnot ced.

A factor, which it is felt is bound to make some impression upon the general tendency of prices, is the excessive c st of freights from Spain to England . . . indeed the cost of transport by sea is beginning to verge upon the prohibitive, and it is a factor the consequences of which must not be ignored entirely. A new development has been seen in the offering of regular monthly quantities of lead from China. It is not expected that this trade will assume any important dimensions, but it is something new, and as such deserves passing reference.

There was a little while ago a good deal of lead offered from the United States, but the position has rather altered within the last week or so, and the American position is one of It is believed that the less willingness to sell for export. stocks which were held across the Atlantic a few months ago have been very materially reduced by the heavy export movement, and this being the case the position of producers there is much better than it was. Hence the lessened dis-

position shown to offer metal for sale.

The output of the Broken Hill region has been curtailed by the various difficulties which came into operation after the declaration of war, but there is little doubt that when peace is restored the trade currents will be found to have been diverted in many important respects, and it is certain that the efforts now being made will secure that Australian concentrates will be treated in British and not in German With the holidays trade has lulled off, but fundamental conditions are much as before.

On Advertisement and Character.

It is very generally recognised that no man in any profession or trade can hope to maintain a proper degree of efficiency unless through the pages of a publication

relating to his calling he keeps himself fully informed of the course of practice and of trade events. What others have done, or are doing, naturally has a bearing upon what the student may have in hand or in contemplation, and it may vary the details of some new commercial enterprise. The editorial pages are, of course, the main vehicle through which such information is conveyed, but the educative value of advertisement pages is also beyond question, and the average reader, whether his bent be scientific or commercial, does not need to be informed that such is the case. But it is not always apparent that the advertiser knows the educative and business-getting value of the space at his disposal. There are advertisements and advertisements, and while advertisers and their publicity staffs may hold very different views as to what is the most suitable form of announcement for an advertisement, nothing is more certain than that a form of advertisement which may make a persuasive or possibly a smart appeal to one buyer and lead to business, may happen to set on edge the teeth of another equally important potential customer. A correspondent dwells upon this point in another part of this issue. It has often been said that American publications show American firms to possess a better appreciation of what is really business-like advertising; this may be perfectly true in respect of some of their popular magazines prepared for the American reader, and it certainly is correct if it refers to their liking for big advertisements. But American methods are legitimate if restricted to America. For Britishers For Britishers whether at home or in the Colonies a British type of advertisement generally carries greater weight. We have no intention to indulge in a homily on the average British temperament and the pitfalls that are to be

avoided and the qualities that are to be displayed in our efforts to satisfy it, but we certainly feel that it is a matter to which British technical and trade advertisers of electrical and engineering manufactures might devote greater considera-tion. A sleepy sort of advertisement which, like the laws of the Medes and Persians, altereth not, is only used nowadays by those who are behind the times and do not study how to make advertisement expenditure yield the highest return. On the other hand, there may be advertising of the flash in the pan order which sets the Thames on fire one week, and lies in sackcloth and ashes the next. Another class of advertisement not unknown is one bordering on the offensive, striking the eye, it is true, but having in the long run an unfavourable effect upon the mind. These are matters upon which it would be extremely interesting to hear the views of both advertisers and readers. inclined to think that in the case of electrical and allied manufacturers the character of an advertisement only does a little less than the goods themselves to build up reputation. A flippant advertisement probably gains for its votaries a character the opposite of serious.

A BREAKDOWN AND LEGAL LIABILITY.

[BY OUR LEGAL CONTRIBUTOR.]

The recent breakdown at Greenwich which must, of necessity, have occasioned a vast amount of inconvenience to a large number of persons, suggests certain interesting legal questions. Can the London County Council, as undertakers of the tramway system in South London, be held responsible, and, if 10, to what extent, for damage caused? We need not deal with the question of liability for personal injuries, as no one seems to have suffered in that way; but many a breadwinner may have suffered pecuniary loss owing to his not having been able to get to work in time through the breakdown of his customary means of locomotion. Can he sue the County Council?

Cariously enough, one may search the law books through without finding any light or leading upon the exact nature of the obligation which is thrown upon a tramway authority by the sale of a ticket. The Tramway Act, 1873, is silent in the matter; while the Act which empowers the County Council to run tramcars makes no special mention of the

obligations of the Council to the cit zens.

One is, therefore, constrained to go back to first prirciples in order to define the legal position. It is a question of contract, and so far as the relations between the tramway authority and the passenger are concerned, the question -what is the obligation of the authority? A man buys a ticket for 1d. in order to travel from Blackfriars Bridge to the Elephant and Castle. All the County Council are bound to do is to take him there. One supposes that the law would infer a contract to take him there within a reasonable time. If a breakdown occurred while the tramcar was en route, the fare could get his money back; but that would be the extent of the liability of the Council. That body is under no obligation to run a tramcar on any particular day—or, rather (to put the matter a little more accurately). they are under no obligation to carry Mr. James Robinson (or anyone else) from his residence in the suburts to his office in the City. If the cars are running, Mr. Robinson, of Tooting, has as much right to a seat as Mr. Brown, of Balham; but if the cars are stopped for a day or a week, neither of these two gentlemen could sue the County Council for damages. So it is conceived that if, as a result of the breakdown a week or two ago, a City man sustained damages caused by delay, he would have no claim against the London County Council.

Even in the case of a railway company it has been held that the mere issue of a ticket from A to B, apart from any conditions in the time bills, implies no warranty that a train will start at the time at which the passenger is led to expect it, and if the train arrive too late to enable him to complete a through journey, he cannot recover damages. A fortiori the County Council, whose tramcars run according to no particular time table, are under no liability to their passengers.

It is somewhat odd that clauses which are to be found in Acts of Parliament relating to the supply of electricity, and which excuse the undertakers for the damage caused by breakdowns, are not to be found in Tramway Acts or previsional orders. It may be interesting to refer to the relevant provisions of the Electric Lighting (Clauses) Act, 1899. After providing for the infliction of certain penalties

for delay, it goes on :-

"Provided that the penalties to be inflicted upon the undertakers under this section shall in no case exceed in the aggregate in respect of any defaults not being wilful defaults on the part of the undertakers, the sum of £50 for any one day, and provided also that in no case shall any penalty be inflicted in respect of any default if the Court are of opinion that the default was caused by inevitable accident or force majeure, or was of so slight or unimportant a character as not materially to affect the value of the supply."

Nice questions sometimes arise as to what constitutes force majeure, which is sometimes described in legal documents as "the Act of God or the King's enemies." case which was heard in Dublin in 1899 it was proved that the supply of energy had broken down owing to certain defects in a cable which had not made themselves apparent for a considerable time. It was held that the company were excused on the ground of inevitable accident (Sun Insurance Co. v. Dublin Corporation, Dcc mber 9th, 1899). But the define of force majeure or inevitable accident In Shadditch r. will not avail a company in every case. London Electric Supply Corporation, the keeper of licensed premises at Deptford summoned the de'endant Corporation for failure to supply elec ricity to his premises. The default was admitted, but the defence was force majeure, it being contended that the supply of electricity having become dcficient owing to unavoidable causes, it became essential that some part of the district of the company should be cut off, and that Deptford was selected as causing the least public inconvenience. The full penalty of 40s. was inflicted in each of the seven cases, with 20 guineas costs in the first case and 2s. costs in each of the others. It would seem, however, that where the company are taken by surprise, and asked to supply a number of consumers for whom they have not made adequate arrangements, they will be leniently dealt with. Thus, in Marylebone Vestry v. Metropolitan Electric Supply Co., the company were summoned by the Vestry and Guardians for default in supplying electrical energy to the workhouse and Vestry premises on certain The company admitted the default, and contended that the same was due to inevitable accident, caused by the great increase in the demand for e'ectricity, which had exceeded their expectations. The case was at first adjourned, and eventually small fines were imposed.

It would seem that if any negligence on the part of the company can be proved, it is futile for them to urge a plea

of force majeure or inevitable accident.

Thus the faulty laying of a cable which led to a break owing to subsidence; defective insulation leading to short circuit; carelessness at the central station which led to a stoppage of all the machinery; none of these things could be pleaded in answer to a summons for failure to supply. On the other hand, the breakage of a cable owing to floods, the bursting of a boiler, or sudden stoppage of machinery owing to some undetected fault, would always be received as a complete answer to a charge of failing to supply.

But it is essential in the interests of the consumer that the company shall take every precaution to secure that even when one set of engines breaks down another shall be

ready to take its place.

We have stated the law as to breakdowns in lighting stations with a view to drawing attention to a curious distinction between the liability of a tramway and a lighting authority. No doubt that distinction may be explained by the fact that whereas an electric lighting company or authority is bound to enter into contracts of an enduring nature, the tramway company is under no obligations save those which we have enumerated in the early part of this article.

ELECTRICAL DRIVING IN THE WOOLLEN TRADE.

By J. F. CROWLEY, M.Sc., B.A.

(Abstract of Locture delivered before the HALIFAX TEXTILE Society, on December 3rd, 1914.)

ELECTRIBITY has not found the same application to textile factories here as it has in other countries largely owing to lack of knowledge of its advantages on the part of manufacturers. It of knowledge of its advantages on the part of manufacturers. It is proposed to consider the engineering problems that arise when a decision to install electrical driving is adopted. It will be assumed that it has been decided to adopt two-phase or three-phase current, and that questions of voltage and frequency which may depend on the current available from the local supply authorities, the size of the factory, & ... are discussed with an electrical engineer familiar with the conditions.

In considering the application of electrical driving to the woollen trade, it should be borne in mind that this trade has certain peculiarities from a driving point of view, such as:—

(a) Small total H P. required for each factory as compared with,

for instance, the jute trade or the cotton trade.

(b) Particularly poor load factors, that is, a small percentage of the machinery running at a given instant.

(c) A varying trade, which may mean the shutting down of a number of machines for long periods, or, again, the running of machines at night when trade is brisk.

Where such conditions prevail, electrical driving shows to particular advantage. When it is decided to install electrical driving the first point that requires decision is the type of drive to be installed. Broadly speaking, the choice of the manufacturer lies

(a) Group driving in large units.(b) Group driving in small units.

(c) Individual driving.

We do not find in the woollen trade the degree of standardisation of machinery and lay-outs that obtains in the cotton trade; consequently the case of each woollen factory has to be considered on its merits to an even greater extent than is necessary in the cotton

Group Driving.—The simplest application will be the installation of a single motor to replace an existing engine, which is generally a very unsatisfactory application, since, while it means the provision of a steady turning movement on the main shaft, it means also the of a steady turning movement on the main shaft, it means also the retention of all existing shafting with no reduction in friction losses, &:. For the average case, therefore, the shafting should be divided up into carefully selected groups, each group being driven by a separate motor. It was realised early that by dividing up shafting into large groups, and driving these groups by means of electric motors, many advantages could be obtained over the older systems of driving from one central source. It is now being realised that these advantages are greater still where the driven units are smaller and when still shorter lengths of shafting are units are smaller and when still shorter lengths of shafting are taken. Thus, the method of group driving in small units is gradually obtaining wider recognition. The movement in this direction has been aided by the improvement in the efficiencies of small motors, and the reduction in cost of these machines.

Having decided on the grouping of the shafting, the next point to receive attention should be the motor speed, and the method of connecting the motor to the shafting. In woollen factories shafting speeds are low, frequently not exceeding 90 RPM., and the points mentioned, therefore, require special attention if expensive motors of unduly low speeds are to be avoided.

Spasking generally, the ideal group drive consists of a motor placed in the centre of the line shaft and provided with flexible couplings on both sides for connecting to it. With this arrangement the speed fluctrations of long shafts are avoided, and also the losses in the connecting link between the motor and the shaft, With low-speed shafts, however, this is out of the question, since the cost of an electric motor, other things being the same, increases as the speed is lowered, and belt drives, rope drives, gearing and chains have to be considered. Where speed ratios are not abnormal, and the conditions enable satisfactory centres to be obtained, and where also the powers to be transmitted are not excessive, belts provide a very satisfactory drive. Where the powers to be transmitted are not excessive, belts provide a very satisfactory drive. mitted are great, belts can be replaced by ropes, which have also a wide field where a number of defferent shafts have to be connected to the same motor, as is the case in the modern rope race, or by steel belts which are largely used in Saxony, but have not come very widely into use here. Where the distance between centres is small, and a large reduction ratio is required, other methods must be adopted. Worm gears are generally to be avoided owing to their low efficiency, which does not improve with time. Double helical gearing, on the other hand, has reached a high s ate of perfection, and chain-driving has come very widely into use for factory drives. Generally chains possess the great advantage of having, and of maintaining, a high transmission efficiency, while the drives are not affected by slight alterations in shafting alignment, as would be the case with gearing.

Individual Driving—Any advantages claimed for group driving in small units over group driving in large can be claimed for individual driving over both systems, while, in addition, special advantages can be obtained with special machines, such as looms, mules, ring doubling frames, centrifugals, &c.

The advantages of individual driving are :-

Saving in power.
 Increase in production due to-

(a) Specific advantages in the case of certain machines.

(b) Better supervision, &c.

Against these must be put the greater cost of an individual drive installation over a group drive installation. The proper balancing of these advantages against the increase in cost is the problem that the manufacturer has to solve, and here he will find expert assistance indispensable.

Regarding the first advantage claimed for individual drive— namely, saving in power—two points might be referred to:—First, the accurate measurement of power transmission losses has only been possible since the introduction of electrical driving; secondly, these losses are very much greater than is ordinarily assumed. take one instance only, the increase in friction losss when shafting is loaded up is usually treated as negligible, though it is frequently very large, as can be seen from the following test

figures.*

The test was carried out for 20 hours on six looms on group drive, then for a similar time on the same looms on individual drive, with the following results :-

Group Drive.

187.876 Total number of picke... Consumption of motor, shafting belts and looms ... 72 KW.-hours Consumption of motor, shafting belts and loose 32 KW.-honrs pulleys Apparent consumption of looms 40 RW. hours

Individual Drive.

Total number of picks... 361.206 Consumption when driving looms ... 53 KW.-hours 27 KW.-hours Consumption for 187,876 picks Actual consumption of looms (motor efficiency

75 per cent.) = '75 × 27 ... 20 KW-hours

Now, the difference between the apparent consumption on group drive and the actual consumption on individual drive, viz, 20 hours, is due to the additional losses caused by the loading of the shafting. The shafting, belts and loose pulleys, as distinct from the motor, took 22 kw. hours, and hence the additional losses form

91 per cent. of the light-load losses.

Subsequently, at another factory, the same writer took a further test, wh n the additional losses proved to form 174 per cent. of the light-load losses. These figures are rather illuminating when we remember how general is the method of measuring friction losses

by indicating an engine on light load.

The efficiency of a modern loom motor of the size used in these tests would not be less than 87 per cent.

In estimating the saving in power with individual drive, account must be taken of the load factor on which the machines are running, since, of course, the advantages of individual driving are the greater the worse the load factor. By load factor is meant what in the weaving shed is known as "weaving efficiency"—that is, the ratio of the actual production of the shed to the maximum resible assuming no attack production of the set to the maximum resible assuming no attack production of the set. possible, assuming no stoppages of the looms for any cause during norm il working hours. With individual driving, the power consumption for each machine ceases when the machine stops, while with group driving, the whole of the shafting and belting must be run while a single machine is required, thus :-

If N = the load factor of the mill, per cent., I = the power lost with individual drive, and G = the power lost with group drive,

then for the energy losses with individual and group drive to be equal, $I \times N/(G \times 100)$ must equal 1.

If this formula gives a result greater than 1, then individual driving is at a disadvantage from a transmission loss point of view, while, if the result is less than 1, the advantage lies with individual

while, it the results here than it the advantage lies with individual driving. In no case that the lecturer is aware of have individual loom drives with high-efficiency motors shown to disadvantage.

Individual Driving of Leoms.—A weaving shed in Lancashire has a weaving efficiency of 77 per cent. to 80 per cent. for ordinary looms, and approaching 95 per cent. for automatic looms. In the woollen trade, however, 60 per cent. would be an average figure, and it would probably be correct to say that only a high-class shed would reach 66 per cent. This means, therefore, that at a given instant 40 per cent. of the looms are shut down showing what a large saving in power should be effected with the introduction of individual drive.

If a regular drive is provided at the loom shaft, it will be found that the average speed of the loom can be increased, and it is this regular drive which a three-phase loom motor particularly does provide, improving the weaving efficiency of the loom for two

1. The regular speed reduces the number of warp and weft

breakages very considerably.

breakages very considerably.

2. The time absorbed by stoppages is considerably reduced owing to (a) The shorter time taken by an operative to start a motor as compared with the moving of a belt from a loose to a fast pulley; (b) The high starting torque of the motors, which still further assists in securing prompt starts with the "lay" in any position.

It is satisfactory, as a result of something like 40 tests carried out in various parts of the country with individual drive, to be able to say that in no case has a smaller increase in production than 10 per cent, been obtained, while in some cases the percentage increase has been as high as 25 per cent. Improvement in the quality of the material is a result invariably found with individual drive, and should mean a distinct saving in the mending drive, and should mean a distinct saving in the mending department.

Simplicity and safety in the weaving shed are not being sacrificed to obtain the results referred to. The motor and the switch are of the simplest possible construction, and contain few parts likely to get out of order.

* E.TZ., Band 49, 1912, G. W. Meyer.

Individual D viving of Mules.—Spinning on the mule, as distinct from spinning on the ring frame, is a discontinuous operation, and steadiness of drive is of vital importance. Broadly speaking, two
main principles should be observed in the driving of mules, either:—

(a) To drive as many mules as possible, preferably all the mules

in a factory, from one motor, or

 (b) To drive each mule individually.
 To quote from a paper read before the Institution of Electrical
 Eagineers by Mr. H. W. Wilson: — "Spinning mules represent one of the most variable loads it is possible to obtain. It is necessary to drive a number of them from a single machine, so as to damp out the flustuations as much as possible, and get something representing an even load. With four mules on a single motor, the writer has seen variations in demand from 15 to 90 H.P. almost instantly, and this manifestly represents a condition of affairs under which no motor can maintain an absolutely constant speed. Broadly speaking, it cannot be said to be a good practice to drive fewer than 12 mules from a single motor of, say, 150 H.P."

Again, a recent writer, in describing an installation, says:—

"Mules gave a load varying in the case of a 75-H.P. motor driving two pairs of mules, from 40 to 120 H.P."

The actual H.P. figures apply to control mules, but the difference

The actual H.P. figures apply to cotton mules, but the difference by tween cotton mule powers and woollen mule powers is one of degree, and not one of kind, since approximately the same percentage flucthe same percentage nuctuations are present, and the same treatm nt is needed. With individual drive, the variations in speed that occur simply ease the passage from one stage to another in the cycle of operations, while a constant speed is obtained during the actual spinning period

a constant speed is obtained during the actual spinning period when steadiness of speed is essential.

With mechanical drive, on the other hand, or with group electrical drive, the peak loads of a certain group of mules may synchronise and produce a speed variation on the system of serious effect on the other mules, since it does not happen to synchronise first constant.

This point is of far greater moment than

effect on the other mules, since it does not happen to synchronise with their operations. This point is of far greater moment than an improvement of a few per cent. in actual speed variation itself.

Indicidual Driving of Centrifugals.—There are few machines in a woollen factory that are shut down for longer periods than the centrifugals, and, generally speaking, the individual driving of these machines is desirable on this account, and also on account of the difficulties connected with the starting and stopping of the machines. Wherever possible, a vartical motor should be employed, with its rotor mounted direct on the spindle of the centrifugal, the motor being placed either above or below the bowl, depending on the design of the centrifugal. In case this bowl, depending on the design of the centrifugal. In case this drive is not practicable, individual driving may be carried out with a quarter-twist belt drive. Owing to the great inertia of the bowl which has to be accelerated, the motor starter has to be of a specially large size. When a centrifugal is stopped, the stored energy has to be dissipated in some way, and with individual driving, particularly where a large number of centrifugals are installed, it is often advisable to adopt electrical braking over a installed, it is often advisable to adopt electrical braking over a considerable portion of the retardation period, since, by this means, a large part of the energy absorbed by the machina during the acceleration period can be returned to the line. For this purpose, where the number of centrifugals to be driven is small, three-phase, pole-changing motors are generally employed. For sugar refineries, where a considerable number of centrifugals are generally installed, it is often advisable to alopt continuous current, as this enables simple systems of economical starting and electrical braking to be used. braking to be used.

Conclusion.—Individual electrical driving is employed to a large extent in Germany, and the speed control this gives the operative is largely responsible for the ascendancy Germans have been able to obtain in certain sections of the textile trade, notably calico to obtain in certain sections of the textile trade, notably calico printing. It is exactly four years since experiments were carried out which led to the putting down of the first large individual driving installation in this country—that of 800 motors in the shed of Messrs. Frears, Lord & Brother, Bradley Fold. When the order for this pioneer plant was placed, only one British firm could manufacture loom motors, and that firm got the order. In the case of a recent loom motor order obtained by the same firm, they found themselves in competition with not less than five other found themselves in competition with not less than five other British electrical firms. You cannot have better proof than this that individual driving is the right thing.

INSTITUTION OF ELECTRICAL ENGINEERS.

A SPECIAL MEETING of the members of the YORKSHIRE LOCAL SECTION took place on December 17th, at the Hotel Metropole, Leeds, the chair being occupied by the chairman of the Section (Mr. T. Reles). The meeting had been specially convened in order that the President of the Institution (Sir John Snell), the treasurer (Mr. Rebert Hammond), and the secretary (Mr. P. F. Rowell), might have an opportunity of meeting the members of the Section, as the usual occasion for that purpose—the annual dinner—had been shandoned. been abandoned.

The CHAIRMAN extended a cordial welcome to the three reprentatives of the Institution from London. After referring to some of the activities of the Local Section, he urged that the mambers

should be kept better informed as to what was going on up in town.
Sig John Snell promised that he would put before the Council the suggestion that more publicity should be given to the doings of the Council in the Journal, and said he believed that the Council

did not desire to hide things from the members. He thought great good had been done in the co-ordination of the Papers Committee of the Institution, one result being that papers were now not only read in London, but were read and discussed in the provinces as well, thus getting a wide and catholic discussion upon them, and making members of local sections feel that they were all combined in one Institution. One of his first wishes was that the Local Soctions should be in accord with the Council. With the the Local Socions should be in accord with the Council. With the stringent qualifications which were now required by the Institution of Electrical Engineers in regard to the admission of new members and new students or graduates, and the requirements in regard to examinations, there would be brought about a pronounced improvement in the status of the electrical engineer. A sign of the times was seen recently in the request which had been made to the Institution of Electrical Engineers, through him as the President to prominate from among the members of the Institution. the President, to nominate from among the mombers of the Instition some 20—and more were yet to be appointed—gentlemen for commissions in the Royal Garrison Artillery. He had no doubt that in time the Institution would be asked to nominate people for some of the other Government services. There was a great deal of sound sense in the suggestion of the chairman in his address to the Section, that while trade was slack, obsolete plant should be replaced and improved methods of driving adopted. If electrical engineers could point out to manufacturers that by the adoption of electrical systems they could save some 25 or 30 per cent. on their cost of power production—which would mean over 1½ per cent, on their total cost of production—if they were sensible poople they would take notice of the advice and put their houses in order. This especially applied to textile districts, where a very small fraction of a penny per pound on materials made all the the President, to nominate from among the mambers of the Instiin order. This especially applied to textile districts, where a very small fraction of a penny per poind on materials made all the difference between profit and loss. He supposed that when peace was restored the Germans would revive competition, and unless the British manufacturers looked to it the competition would become, as time went on, more and more keen. In connection with this question he expressed the hops that British electrical manufacturers would put their hands to the plough and see that they sent abroad both to the Colonies and to foreign countries properly trained electrical men to represent them. They all knew that great complaint was made to represent them. They all knew that great complaint was made that manufacturers sent out to the Colonies and to foreign countries representatives who, whilst they were admirable comcountries representatives who, whilst they were admirable commercial men, were not sufficiently good engineers to be able properly to represent the British electrical engineering industry in other countries. He would like to see the younger members of the electrical profession learn, in the first place, Spanish, and afterwards Russian, because he thought that in Spain and Russia there was going to be a great expansion of electrical activity. In conclusion, Sir John referred in detail to the privilege which had been given to the Institution of assisting the War Office in connection with an Engineering Unit of the new Ruyal Naval Division, and he expressed the view that this Unit, which was highly skilled in all branches of engineering, would have very special work to do during the next few months.

The meeting of the BIEMINGHAM LOCAL SECTION on Wednes-

The meeting of the BIRMINGHAM LOCAL SECTION on Wednesday, Doomber 16th, was also attended by Sir John Snell and Mr. Rowell. After an expression of wolcome from the chairman, Dr. Railing, Sir John Snell addressed the meeting, and after referring to the work of the Local Sections reminded the members of the objects for which those Sections were established and of the useful objects for which tubes seemed were exactled and of the destruction of functions they were able to perform. He afterwards dealt with the subject of remuneration of young engineers, pointing out the advantages that would accrue to the community if the electrical profession were made sufficiently attractive to the men of the highest ability, and expressing the hop) that the Institution might be successful in effecting an improvement in this respect. He also urged the advisability of all young electrical engineers joining the Institution and thereby gaining a status which would help

them in their careers.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

German Firms posing as Belgians.

With reference to Belgian agencies, it seems that a number of Belgian electrical dealers are trying to get into touch with British makers in order to represent them on the Continent.

That is quite right and marks a step towards a keen Anglo-Belgian co operation.

But what would surprise many manufacturers is that German limited companies, trading in Balgium under French names, and calling themselves "all Belgian," have sent their representatives or "technical engineers" as well over here.

They also want British goods, perhaps with the purpose of selling out their Garman stock under a British label.

I should like to know what are the patriotic feelings of the Belgians who act as agents of our enemies' firms? They are certainly not at the front where their right place shoul i be.

Kindly warn the British firms of the unfair proceedings I have

E. Janssens.

U.S.A. Safety Rules.

The second part of your comment on the rules in Circular No. 49 of the National Bureau of Standards has been read with much profit

we note that you support the advantages of standardisation in operating safety rules. The variations in British practice which you mention, some companies issuing booklets, others posting instructions, and still others relying upon verbal instructions, parallel closely the conditions found in this country.

parallel closely the conditions found in this country.

Due to the different character of construction, standard safety rules for British practice could undoubtedly omit some of the provisions which seem advisable for American practice. In fact, as construction betterments are made, some of the safety rules now necessary will gradually become less applicable and finally unnecessary in this country. It seemed advisable in the first edition of such rules to include the precautions which present construction and practice render necessary. We shall be very glad to render any assistance should such a work be undertaken in Great Britain.

A principal difficulty found by long observation, many confer-

assistance should such a work be undertaken in Great Britain.

A principal difficulty found by long observation, many conferences, and the consideration of many sets of rules, is that proper qualification of employés, even for the same work, conveys such varying ideas and permits so many unequally safe practices, that, as a part of proper qualification, the uniform familiarity with a standard set of precautionary measures and the uniform use of such measures should be required as a portion of this very qualification. Partly for this reason many rules cover practices, note of which, it might be at first thought, proper qualification would render unnecessary, but these rules have been shown to be necessary by a history of accidents due to the diversity in qualifications in different classes of electrical work. different communities and in different classes of electrical work.

Many accidents might be avoided also from causes which upon thought are known to the employé to exist, but which dependence apon verbal instruction or general qualification has long prevented from being brought strongly to his attention. Such instructions, if followed, would in fact apparently avoid under existing American conditions at least 200 fatalities annually. The almost universal support of the simple precautionary rules, as well as the more specific ones, by American companies, has resulted from the footunate experience of many large parameters in involved the

more specific ones, by American companies, has resulted from the fortunate experience of many large companies, in reducing this class of accidents by utilising their educational value.

Another feature notable in present American practice, is that isolation by elevation on poles, or above floors in stations, or by other methods is frequently depended upon for the protection of employés, where work necessarily occurs in the vicinity; as, for instance, upon other wires on the same poles and upon neighbouring equipment in stations. The opportunity for unsafe approach of the person or the implements he is using has frequently led to fatalities. A definite minimum for such approach has been thought to bring attention to the hazard, and to prevent taking chances at distances less than can be generally considered thoroughly safe.

It is hoped that adoption by the States and municipalities of reasonable and uniform construction requirements will greatly reduce the number of accidents which occur from unguarded parts which might be by better practice readily guarded, and will so reduce the necessity for so extensive personal precautions on the part of the workmen themselves.

part of the workmen themselves.

Appreciating greatly your careful consideration of this set of iles, from which we have derived much of benefit for our future revisions.

E. B. Rosa,
Acting Director.

Department of Commerce, Bureau of Standards, Washington, December 1st, 1914.

Wonderful Accumulator Cells.

In the window of a firm specialising in ignition devices, in this town, the following notice is to be seen:

"This Farady Hawdon improved storage battery has been standing totally discharged since April 9th, 1914. The plates are free from sulphate. This will appeal to you."

It does, immensely. The cell is a 10-ampere-hour in a celluloid

case, and appears to be fitted with kaolin separators.

The positive plate is now of normal size. The colour?—spare me this. It reminds me of an advertisement that I saw in a South Coast local paper, many years ago—a motor-car man again—offering to "cure permanently" sulphating.

Newcastle-on-Tyne.

London Electricity Supply Scheme.

The London electric supply companies seem especially fertile in causing complicated situations. Just recently, when the London County Council brought forth their comprehensive power scheme, it certainly looked as though they were coming to a settlement. The same day as the L.C.C. Bill appeared, out comes another pair of Bills promoted by a partial group of the London supply companies as a rival measure. Prima facie, it would certainly seem somewhat discreditable that the London electric supply companies should have had so many years to bring forward a scheme, and should, after blocking as much as they conveniently could the London County Council scheme, have the audacity, so to speak, to bring out at this juncture a partial and incomplete scheme of their own. their own.

It is not as though the whole of the London companies were represented. The group is practically comprised of the West End companies, who have their own "fish to fry" in the Central Co., who, we notice, also figure amongst the promoters. It is surely ridiculous to think that a group of companies who have at present limited areas and absolutely the pick of London, and who are mostly earning what they think are satisfactory dividends, will go mostly earning what they think are satisfactory dividents, will go out of their way to develop outlying areas which mean much work and little profit. Certainly we have no reasonable cause to think they have any such beneficent motive. The more reasonable conjecture is that they are afraid of the London County Council. conjecture is that they are afraid of the London County Council Bill, and have simply promoted this as an emergency measure to try and get hold of the powers and then do as little as possible. Certainly they do not commit themselves over their present Bill, except to improve the supply of electrical energy; and, moreover, there is a ludicrous provision that the new company shall, within three years, submit to the Board of Trade a "scheme." Anything more lacking in obvious bona fides it is difficult to imagine. At the same time, we must congratulate them on their boldness in attempting in such an obvious way to throw the London County Council scheme off the track.

Council scheme off the track.

Parliament should certainly look to it that whoever takes over these London electric powers should be people who actually mean to begin work at once, and whose clear interest it is to do such work and not temporise, under cover of submitting scheme after scheme, a line of policy of which everyone is now heartily sick.

Onlooker.

Advertising Methods.

I have often wondered whether advertisers consider to what stent their advertisements are likely to repel customers. There extent their advertisements are likely to repel customers. There are many serticles advertised in an aggressive, vexatious, or annoying manner. For example, one takes up *Punch* with the object of being amused, and one comes across a whole page whisky advertisement which affords one no amusement whatever, but rather the ment which arrors one no amusement whatever, but rather the contrary, and tends to prejudice one against the article advertised. Scores of instances could be mentioned of advertisements which are calculated to annoy and repel quite as many persons as they attract. The disfigurement of rural districts traversed by our main lines of railway for example. The war has at any rate relieved us for the present of the occulting electrical advertisement

The castigation administered by your editorial remarks a fortnight ago, is fully deserved, and I trust it will have the effect of making advertisers realise that some methods of advertising are not only illegitimate, but being vexatious to the public, are injurious to their interests.

Consultant.

London, December 19th, 1914.

Rear Lights on Vehicles.

Your suggestion to affix rear lights on those people who find a difficulty in describing a straight line from one point to another after dark, is a capital one, and should be immediately enforced,

especially in view of the coming festivities.

The idea might, with every advantage, be extended to the Provinces, where farmers are continually endangering the lives of motorists by moving flocks of sheep along the road after dark.

I myself was the unfortunate victim of this habit last week, but thanks to the yielding nature of the obstacles, little personal injury

was suffered.

Wishing you every success and the compliments of the season.

Julian G. Thain,
('hief Engineer and Manager.

Stratford-on-Avon, December 24th, 1914.

From the Front.

I can assure you that my comrades and myself are most grateful to you for being so kind as to send us your valuable paper. It makes it seem as though we were back in the office again when we can keep in touch with the electrical world like this. There is quite a scramble for turns among the boys here to read the contents of the REVIEW, and I think we will have to draw lots for turns. I don't know whether it will interest any of you to have a few lines from the front, but, as you know, owing to the Censor, it won't have to contain very much information.

it won't have to contain very much information.

As you will see, I am attached to the Wireless Section. We are having some terrible weather over here—wet, cold, raw and muddy; it is wicked, sepecially with our work, which is, of course, worked by shifts of 6 hours on and 12 cff, day and night. Still, we are getting quite used to this kind of life now, and I am very pleased to say that there is not a single case of illness amongst us, which speaks very well, seeing that most of the men are Post Office operators, and others from offices, &c., and not used to the openair life.

Wishing the ELECTRICAL REVIEW staff a very merry Christmas and a bright and prosperous New Year, with all good lick for the valued ELECTRICAL REVIEW.

Arthur Maugham.

"We Can't Take the Risk."

With reference to the article entitled "We Can't Take the Risk," we feel, as electrical manufacturers, that we cannot let such an indictment pass unchallenged. We must admit that on the surface it would appear that we manufacturers are not doing much to capture the trade which our war with Germany will undoubtedly give us an opportunity of doing, but we will not admit that this apparent neglect is in any way due to nervousness or want of enterprise on the manufacturers part. We believe that our troubles are the same as those of almost every manufacturer in the country. Every paper that we read tells us that now is the time to get hold of German trade, and no one would be better pleased than we should to do so; but, so far from being able to do so, we are having the utmost difficulty to retain our own trade. This difficulty, however, is in no way connected with fear to take the risk, but purely absolute inability to get men.

Since the war commenced we have lost 70 men and have not With reference to the article entitled "We Can't Take the Risk,"

Since the war commenced we have lost 70 men and have not succeeded in replacing a quarter of these. The men who are left have made a splendid effort, but, of course, have been unable to maintain our turnover, and we at the present moment find ourselves inundated with orders and fairly considerably behind in

This shortness of men has not, however, in any way discouraged us, and we some months ago placed a contract for an extension to our factory, which will, we hope, be complete in a few weeks, when we hope, on the return of more normal times as regards labour, to find that we can not only keep our own customers, but labour, to find that we can not capture some of the German trade.

The Crypto Electrical Co.

J. G. SHAW.

London, N.W., December 24th, 1914.

German or British?

Under the above heading there appears a letter in your last issue dealing with the nationality of the representative of this company in Australia. As stated in that letter, Mr. Hentz is German, but he is not in our permanent employ; his services were placed at our disposal temporarily last spring, when the representative whom we were sending out died suddenly a few weeks before the date when he should have sailed. Mr. Hentz was at the time travelling in the East on behalf of the German Tudor Co., and, in view of the fact that in former years he had represented the German Tudor Co. in Australia, we were glad to find this tem-

porary solution of a difficulty.

When war broke out, realising that the position was unsatisfactory, we arranged with an Australian engineer, who had previously been in our employ over here, to represent us for a few

previously been in our employ over here, to represent us for a few months, and one of our engineers who has been with us for many years is proceeding to Australia in January to represent us definitely.

I admit that, in stating that we had no Germans in our employ, I had overlooked Mr. Haggemann, who is a battery inspector, and also had overlooked a second inspector in Australia; this error of a fraction of one per cent, of the staff does not seem very serious.

In regard to the country of manufacture of Tudor batteries exported to Australia, for many years the German Tudor Co and

exported to Australia, for many years the German Tudor Co. and ourselves did business there concurrently. Whenever batteries were ordered from us, they were invariably manufactured at our works at Dukinfield: when the batteries were ordered from the German Tudor Co., they were sometimes manufactured in Germany, they were frequently manufactured at our works to the order of the German Co. An agreement, however, was made between the two companies some two years ago, by which we have now the sole rights of supply in Australia and all other British Colonies, except in cases where the purchaser expresses a wish to have a German-made battery, which, of course, may occur when the battery is a sub-contract and the main contract is placed with agents repre-senting German electrical firms.

I am sorry to have troubled you with such a lengthy explana-

tion, and trust that your correspondent will now be reassured tha all batteries purchased from us are manufactured in this country.

E. Jacob, Managing Director,

TUDOR ACCUMULATOR CO., LTD.

London, S.W., December 29th, 1914.

Our notice has been drawn to a communication received by you, and printed by you in your "Correspondence" column of your issue of December 25th. Without wishing to enter into a lengthy correspondence, we think the following facts will be of interest to

This company has been duly registered under the English Companies' Act, and over two-thirds of the capital issued is held by British subjects resident in this country. Moreover, all our directors are British, and likewise are resident in this country. Further, all the hands we employ, which number many hundreds,

are of British nationality.

In conclusion, the "Wirum" lamp, which we make, is, and always has been, manufactured in this country, at our works at Brimsdown, from inception to completion.

The Brimsdown Lamp Works, Ltd.

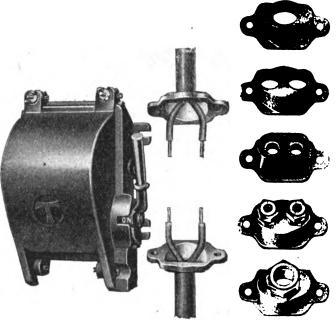

(LESLIE HAYES, Director.)

London, W.C., December 29th, 1914.

NEW ELECTRICAL DEVICES. FITTINGS AND PLANT.

New Ironclad Switch.

MESSES, J. H. TUCKER & Co., of King's Road, Hay Mills, Birmingham, are introducing a new ironolad D.P. switch for 25 amperes at 600 volts, which embodies some valuable features. It has a quick make as well as a quick break, and the blades cannot It has a quick make as well as a quick break, and the blades cannot be held in an arcing position, both movements being positive and independent of the operating handle. The blades are firmly held in the on and off positions, independently of any spring, and the breaking of the circuit is not wholly dependent on the action of a spring. The blade is so shaped as to ensure a perfect contact; the clips are well recessed on a substantial base of vitreous porcelain, and are screened from dead metal. An interlocking device is provided to prevent switching on while the cover is open, or opening the cover while the switch is on opening the cover while the switch is on.

-NEW IRONGLAD Fig. 1.-SWITCH.

FIG. 2.—ADAPTERS FOR USE WITH TUCKER SWITCH.

Special attention has been given to the wiring of the switch; the cables lead directly into the terminals, and various forms of adapters have been designed, fitting on the top and bottom of the switch case, which facilitate wiring and enable the switch to be taken down without disturbing the conduit or casing; some of these are shown in fig. 2.

The insulation consists of micanite alone, and the case is water-tight, lined with the company's special cilicate paint, enamelled outside and stoved.

The switches are subjected in the works to a flash test of 2,000 volts, and one of them has been mechanically operated over 250,000 times without breaking down.

Holophane "Refractor" Globe.

In a pamphlet just issued by MESSES. HOLOPHANE, LTD., of 12, Carteret Street, S.W., a new type of their well-known scientific glassware is described which has been specially designed to carry out the requirements of a correctly installed street-lighting system.

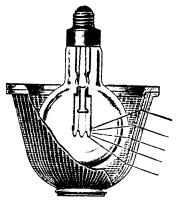

FIG. 3.—SECTION OF HOLOPHANE "REFRACTOR" GLOBE.

Hitherto, mechanical difficulties have prevented the designing of a unit which would embody all the advantages of Holophane prismatic glassware, and at the same time be smooth both on the outside and inside, so that undue accumulations of dust cannot

collect, and also be easy to clean. These mechanical difficulties have now been overcome by the new Holophane "Refractor" globe, which consists of two pieces of glass provided with horizontal and vertical prisms respectively, one piece being placed inside the other.

By the use of the "Refractor," the maximum light is a at an angle of 15 below the horizontal and the intrinsic brilliancy of the filament is reduced whilst the absorption is practically negligible; the lamp is weather protected; the enclosing glass

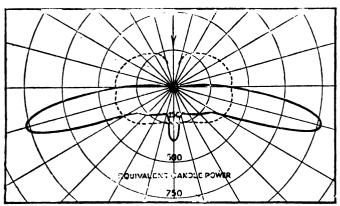

FIG. 4.—LIGHT DISTRIBUTION CURVE OF HOLOPHANE "REFRACTOR" LANTERN.

unit allows for ventilation, and is not a collector of dirt; the light is distributed evenly over a wide area, as shown by the characteristic curve, fig. 4.

The curve illustrates the great advance which the Holophane Refractor" unit makes in the uniform illumination of streets. The firm draws special attention to the value of this develop-"Refractor

ment in these days of restricted lighting, which, under present methods, results in patchy illumination.

New Lamp Suspension.

THE LONDON ELECTRIC FIRM, of George Street, Croydon, has brought out a new type of "lyre" or harp-shaped carrier, with lowering gear to enable the lamp to be trimmed from the ground. The entire absence of projections and the unobtrusiveness of the contact-suspension gear are noteworthy features. No winch or

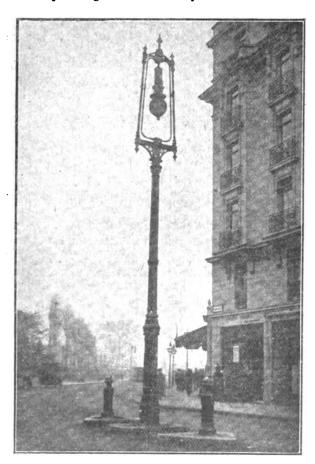

FIG. 5.-NEW LAMP SUSPENSION

rope is outside the standard, and the gear further embodies a onepart device which performs a three-part function, viz, a contact maker, a weight reliever and a lock for the canting inner harp all performed simultaneously by one operation. This also ensures safety, as the lamp cannot be lit until the rope is relieved of the weight and the harp is locked.

Unit System of "Salford" Switches.

THE GENERAL ELECTRIC Co., LTD., of Witton, Birmingham, has developed an attachment which enables its "Salford" switches to be connected up on the unit principle; this consists of a castiron box containing horizontal copper bus-bars, so constructed that they can be connected up easily and solidly with the bus-bars of adjoining switches so as to form a solid run of bar throughout the whole length of the bank of switchgear. In this way any number

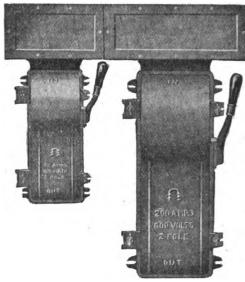

FIG. 6 .- G.E.C. "SALFORD" SWITCHES WITH UNIT SYSTEM OF ATTACHMENT.

of "Salford" switches of the same or different capacity can be connected or disconnected in a short space of time. The attachments are constructed so as to fit easily together, and the principle enables considerable economies to be effected in the cost of wiring up.

LEGAL.

ABBROATH ELECTRIC WORKS APPEAL.

THE Valuation Appeal Court on December 19th decided an appeal by the Arbroath Electric Light and Power Co., Ltd., against an entry of £1,215 in the valuation roll in respect of their works and mains. The appellants asked that £500 should be substituted in the roll. The Valuation Committee by a majority fixed the valuation at £1,100. The grounds of appeal were that the method of valuation adopted by the Assessor in taking only one year's accounts was not in accordance with the proper application of the valuation adopted by the Assessor in taking only one year's accounts was not in accordance with the proper application of the revenue basis; that an average of at least three years' accounts should be taken; and that prior to this year the Assessor based his valuation on an average of three years' accounts, and 1913 was an abnormally good year for the company. For the Assessor it was stated that in 1913 additions were made to the plant and machinery to the amount of nearly £8,000, increasing the value of the subjects by a third, and that the profits earned in 1911 and 1912 did not reflect the earning capacity of the undertaking in its present state, while the profits of 1913 did more nearly represent that earning capacity.

The Court (LORD JOHNSTON differing) adhered to the determination of the Valuation Committee.

tion of the Valuation Committee.

LORD SALVESEN, who gave the leading opinion, said that the Committee had acted with conspicuous fairnes

LORD CULLEN concurred.

LOBD JOHNSTON thought three years' average would be fair.

DEWSBURY CORPORATION r. WILBY.

At the Dewsbury Police Court on December 22nd, Councillor Fred. Wilby, a member of the Dewsbury Borough Council, was summoned in respect of the non-payment of £1 14s. 4d., electricity rent for the use of current at his stand in the covered market-place.

According to the evidence, it appeared that the account referred to the period from April 25th to June 3rd, last year, and the defendant stated that during that time there were only two occasions when current could be consumed—the two weekly market nights. He maintained that the sum was an abnormal charge, and it was important to bring this matter forward publicly, because he could be consumed. it was important to bring this matter forward publicly, because he could not mention it in the Council meetings, as it affected his own interests. The same thing had happened in other cases, though more particularly with regard to gas than electricity. He had allowed the matter to come before the magistrate in order that the public might know whether there was any proper method of checking the meters or not. He gave figures showing that in December, 1912, he would use a great deal more electricity than he did in May, but the account then was only for £1.58.8d., whilst in December, 1913, it was only 188.8d., and in April last 48.8d.

The Magistrates deferred their decision for one month, and suggested that in the meantime the defendant and the Electricity Committee should take an opportunity of meeting together to

Committee should take an opportunity of meeting together to discuss the matter.

WAR ITEMS.

Melbourne City Council and Messrs. Siemens.—From Australian newspapers just to hand it appears that the Melbourne City Council had before it on October 26th a report by the Electric Supply Committee recommending that authority should be given to purchase plant and materials required for extensions of the electric supply undertaking, at an estimated cost of £71,289. Special advice was asked in regard to the purchase of a 1-5000 kw. 3-phase turbo alternator for the power-house, to cost £9,800. The committee asked for the instructions of the Council as to whether it should negotiate for the Willans and Robinson plant with Siemens generator, or invite tenders for the supply of the plant. A report from Mr. H. R. Harper, city electrical engineer, said it was very necessary that immediate steps be taken to procure this additional generator for the winter of 1916. Allowing for the unsettled state of the engineering trade, owing to the European war, it was difficult to say how long it would take an English manufacturer to manufacture and export a plant of this size. It would Melbourne City Council and Messrs. Siemens.-From cult to say how long it would take an English manufacturer to manufacture and export a plant of this size. It would be wise, therefore, to place an order as early as possible, in order to minimise the risk of having a shortage of plant for the winter of 1916. There were two ways of dealing with this matter—one was to call for tenders in the usual way, and the other was to obtain a duplicate of the two last plants from the makers, Messrs. Willans and Robinson. The latter course seemed to him to be preferable, as the two plants recently installed by this firm were proving to be excellent, being economical in steam consumption, with a considerable margin of capacity above that specified. Furconsiderable margin of capacity above that specified. Further, it was a great advantage to have all plant in a powerhouse of uniform size and make, for it cut down the amount of spares to be carried and rendered the operation and mainot spares to be carried and rendered the operation and maintenance of such plant a simpler task to the staff. The town clerk read a lengthy communication which had been received from Mr. A. L. Herbert, general manager in Australasia of Siemens Bros. Dynamo Works, Ltd., explaining the position of the Siemens companies. This is printed in extenso in the "Melbourne Age" for October 27th, together with the following report of the meeting. A letter from Sir E. Grev (dated August 27th) authorising the Siemens companies to continue trading as made in the House of Commons by the Attorney-General, were read. In submitting the report, Cr. Treadwell said his committee had an open mind on the matter, but realised that it was its duty to insist on the plant which it purchased being of a high standard of efficiency. Cr. Morell thought that the Council would be wise to accept the tender. It would mean a saving of money in spare parts, and besides the machines. purchased being of a high standard of efficiency. Cr. Morell thought that the Council would be wise to accept the tender. It would mean a saving of money in spare parts, and, besides, the machines were made in England. Cr. Smith moved that the Council call for tenders. There was no question but that Siemens was a German firm, and they wanted something purely British. Cr. Atkins said they would have to give some direction to the Electric Supply Committee as to how it was going to guarantee that no money would go to Germany. Cr. Cabena said that, taking a purely business view of the matter, they should accept the tender, but there were other points of view, and it was not for the committee to dictate to the Council on a matter of patriotism. He wanted to emphasise the fact that this contract was a matter of expediency and a matter of business. They could place the order for the alternator with Willans and Robinson, and stipulate for a generator made by Kerr & Co., a Scotch firm, or any all-British concern. Cr. John Gardiner said the Council should stick to its policy of calling for tenders. He was not going to be a party to what was practically giving preference to German capital. He trusted that members of the Council would rise to a sense of their obligations in this matter. The motion of Cr. Smith that tenders be called for, excluding German and Austrain manufacture and capital, was carried.

Australia and German Trade.—A Melbourne telegram to a paystralian payerner estates that an anti-Carman League.

Australia and German Trade.—A Melbourne telegram to an Australian newspaper states that an anti-German League, to be formed in Melbourne, is assured of good support. Its object is to prevent trade with the enemy, and information will be obtained on the following points:—(a) The source from which their tradesmen obtain their goods; (b) the nationality of the proprietors, managers, and employés of firms; (c) the nationality of local agents for British firms; (d) what German or Austrian firms are trading under English names. The League hopes to gain the co-operation of the British Board of Trade. It intends to encourage in every possible way the purchase of Australian products.

At the end of October last the Minister of Customs, Mr. Tudor, received a deputation at Melbourne, representing the Australian Protectionist Association, a newly-formed organisation formed with the object of impressing on the Govern

At the end of October last the Minister of Customs, Mr. Tudor, received a deputation at Melbourne, representing the Australian Protectionist Association, a newly-formed organisation formed with the object of impressing on the Government the necessity for providing an effective tariff against foreign goods, and extending to Great Britain trade preference for goods unobtainable in Australia. The deputation, which was introduced by Mr. C. C. Salmon, president of the Association, represented iron, machinery and various other trades. Other speakers supported his views. In reply, Mr. Tudor (according to a report in the "Melbourne Age") said he agreed that the first thing of importance to obtain was employment for the people. That fact was brought home to them more to-day than ever. But he did not agree that employment should be fought for first and conditions

for the workers after. If the manufacturer got protection, the worker should also be guaranteed protection. He believed in protection to encourage the supply of raw material. The deputation was anxious to look after its own country, and if there were any differences of opinion among the people (who all had the same wish) it was as to the best way to do it. Some people thought things ought to be left alone. Others thought employment should be provided for the people. It was not customary for a Minister to give notice as to when a new tariff would be introduced, and he was not going to do it. The Governor-General's speech had promised action this session in regard to Tariff Reform, and the promise would be kept. How long the session would last he did not know. He urged manufacturers to supply the Inter-State Commission or his department in the meantime with all information required. Manufacturers were lax in supplying statistics. Until uniform statistics were supplied there would be a difficulty in granting effective protection. It was impossible to get the production figures for Australia for 1913, despite the fact that customs statistics for 1913 were available in February last. Until the production statistics were supplied by manufacturers to compare with the customs import figures it was impossible to know where they stood. The question of British preference would be a matter for the Cabinet to settle. He would certainly bring it before the Cabinet, although he was not keen on it. Neither was he keen on extending preference to nations assisting us at the war.

keen on it. Neither was he keen on extending preference to nations assisting us at the war.

The Runaway Bombardment.—During the naval bombardment of the Hartlepools on Wednesday, 16th December, from about 8.5 to 8.45 a.m., the West Hartlepool Corporation tramways suffered slight damage. We are indebted to Mr. Charles Burgess, the general manager and engineer, for the following particulars as to the extent of the damage:—Offices: Roof of part of offices struck by shell and carried away. Remaining portion of office slightly damaged. Depôt: Flagstaff on top of depôt splintered. A shell fell a few yards to rear of depôt and buried itself in the railway embankment. Overhead Line: Wires brought down at two points on Hartlepool route and one point on the Park route. Total length down, approximately 300 yards. No poles damaged. Permanent Way: No apparent damage. Rolling Stock: Several cars in service had the windows shattered, and one car standing in the depôt had a controller struck by a piece of shell which came through the window of the depôt. Injuries to Staff: One member of office staff sustained scalp wound (slight). No other members injured, though the depôt staff were on duty when the firing commenced. Delay to Service: About an hour after the bombardment ceased the service was resumed on three routes, and on the remaining route at about 5 p.m., by which time the overhead line was repaired. For some months the department has been engaged in building considerable extensions to the denôt, and these works, which are now approaching completion, fortunately escaped any damage.

Messrs. Richardsons, Westgarth & Co., Ltd., of Hartlepool, write as follows:—"As it has been reported that during

Messrs. Richardsons, Westgarth & Co., Ltd., of Hartlepool, write as follows:—"As it has been reported that during the recent bombardment of Hartlepool our works were seriously damaged, we desire to inform you that although unfortunately a number of our workmen were killed, our works suffered very slight material damage. The actual damage was confined to a few roofs, which were partially destroyed, and a great number of broken windows. No work in progress or machines were damaged, and we are working in a normal way."

working in a normal way."

German Electrical Machinery Dumped in Australia.—We quote the following from the "Melbourne Age" for October 26th:—"For some years past German manufacturers of electrical machinery and appliances have been making strenuous attempts to capture Australian trade in their special lines. Though this is in keeping with an onslaught on the markets of the world in that branch of trade—in the year 1912 Germany exported £8,034,000 worth of electrical goods—the competition of German firms has nowhere been so keen as in respect of Australian business. The imports from Germany in 1912 amounted to £195,000, and while the British percentage of trade was declining that of Germany has rapidly increased. The methods by which Germany has rapidly increased. The methods by which Germany has repaidly increased. The methods by which Germany has rapidly increased. The methods by shich Germany has rapidly increased. The methods by which Germany has rapidly increased. The methods by shich Germany has rapidly increased. The methods by shich Germany has sought to gain business not by honest competition, but by schemes that suggest some of her ethics of the battlefield. In the first instance the standard of certain German machinery and appliances is appreciably lower than that of British lines. Candle-power, according to Germany, is not equal to British candle-power, according to German machinery have dumped goods on the Australian market, content to lose money in the hope that, on capturing the trade, they can recoup themselves with interest for their calculated and profitable generosity. In view of the difference in standards this temporary generosity is illusive. It is not very creditable to the purchasers that 'dumped' German goods are being utilised by them for the supply of public services. The community has at least the right to expect that public conce

German Private War Allowances to Workmen's Families.—It may be of interest to give some particulars concerning the financial allowances which have been made by various manufacturing firms to the dependents of workmen who have been called up for military service in Germany. The Schuckert Electricity Co., of Nuremberg, for instance, which does not enumerate the number of men called up within the circle of its various undertakings states merely that considerable provision had been made for the staff and the workmen. In the case of the A.E.G., the number of men requisitioned by the army authorities by the middle of December was 14,000, and the company had expended £25,000 per month, or a total of £100,000 in the first four months, in supporting the men's families. The cost has been defrayed out of current funds without touching the provident fund which is intended for use in normal times. The position of affairs, however, is set forth much more distinctly by the Siemens & Halske Co., for itself, and also on behalf of Siemens-Schuckert Works, in which the former is joint proprietor with the Schuckert Co. Down to the end of the first week in December the number of officials and men called up from the two companies concerned was 13,526, and the allowances which are being made to the families in the case of men hitherto employed by both firms have been fixed as follows until further notice:—Half of the monthly salary to the wife of an official, and an additional 5 per cent. of the salary for each child under 14; and 6s. per week to the wife of a workman, and a further sum of 1s. per week for each child under 14. The total amount paid by the two firms during the first three months, including special allowances in the first month, is reported to have exceeded £75,000.

Competition with Germany and Austria-Hungary.—In connection with the special arrangements made in the Commercial Intelligence Branch of the Board of Trade for dealing with enquiries in regard to the above subject, lists are being prepared and circulated of articles which enquirers desire (a) to purchase, and (b) to sell. The sixth list is now ready, and may be obtained by United Kingdom manufacturers and traders, together with copies of the previous lists, on application to the Branch. British firms interested in any of the goods mentioned, either as buyers or sellers, should communicate with the Director of the Branch.

Lancashire Tramway Employés and the War.—In consequence of so many of their drivers and conductors having joined the colours, certain tramway companies and municipal tramways committees in central, south and south-east Lancashire are now advertising for both drivers and conductors.

BUSINESS NOTES.

Consular Notes.—SPAIN.—Valencia, with its 250,000 inhabitants, and its wealth derived from the shipment of rich fruit and vegetable crops, is, in the opinion of the United States Consul there, a good centre for conducting a campaign to capture the German electrical trade. He believes that permanent results can be obtained only by following previously adopted methods of personal representation, taking orders by sample, quoting net prices delivered in Valencia, and advancing reasonable credit. If these methods are not adopted and accompanied by low prices, only a transitory trade can be expected. The establishment of a joint agency and sample room is suggested (by the President of the United States Steel Corporation) as a practical means for increasing sales of articles which are not manufactured in sufficiently large quantities to warrant the expense of special propagands by a single manufacturer. This would result in putting Valencia and district in direct communication with foreign markets. It would make them as commercially independent in import trade as they already are in export trade, and as they ought to be, having regard to the size, population and wealth of the territory. An alternative plan, but probably one less satisfactory, would be to appoint as an agent a Spanish house in Barcelona or other commercial centre, having experienced travellers already available. The goods in greatest demand and the approximate retail prices at which they must be sold are as follows:—Lamp sockets (bayonet), 9.1. each; push buttons, 1s. 10½d.; wall switches, 1s. 1½d.; fuse boxes, 3s.; cleats, from 2d. per pair; shade holders, 5d. each; glass shades, up to 4s. 6d.; metal and porcelain shades, up to 1s. 1½d. These are the prices at which the better grades of German makes have been selling, but much cheaper goods have a larger sale. It should be remembered that the secret of success in this, as well as in other lines, is the willingness and ability of manufacturers to furnish an article at the price the trade is willing to

recently been interviewed find it necessary to repeat the warnings to exporters (1) to prepay full postage on their correspondence: (2) to correspond in the Spanish language; and (3) to make use of the international return-postage stamps.

SOUTH AFRICA.—Whilst urging his countrymen to maintain their activities in the South African market, the U.S. Consul at Port Elizabeth admits that English and German manufacturers made the greatest progress in selling electrical material last year. Electrical machinery from America showed a decided increase over 1912 in the face of a decrease in the total amount of imports. In a short time, he adds, all municipalities of any consequence will be lighted by electricity, and the use of power for manufacturing, heating and lighting is rapidly becoming popular. American goods are slowly but surely increasing in public favour, and it is only necessary for exporters to study a little more carefully the needs and customs of the country to make that increase more rapid. In attempting to do business in South Africa, a new man should make a careful study of business conditions and local customs. Any little courtesy that is extended to a possible purchaser is fully appreciated. Many representatives of British firms make a point of asking the head of the department or purchasing agent to luncheon or dinner at least once on every trip. No promises that the firm will not sanction should be made, and plenty of time should be taken to work each town with care. Once a customer is secured, it is comparatively easy to keep him if his requirements receive prompt attention. In packing goods for Port Elizabeth it must be remembered that, during unloading, articles, unless extremely bulky, are placed in large rope slings or hammocks in the vessel's hold, hoisted out over the side and transhipped into lighters alongside. Consequently a parcel is frequently upside down or on its side. Strap fastenings and blookings should have direct bearings on the contents of the case at every angle.

SIAM.—Tungsten.—The United States Consul at Bangkok calls attention to the deposits of wolfram found in Nakon Sri Tamarat, on the east coast of the Siamese portion of the Malay Peninsula. Here the wolfram ore had been left in great heaps as valueless material after having been separated from the tin ore by the Chinese miners. The amount of wolfram recovered during the fiscal year 1912-13 was 309 tons, against 119 tons for the previous year. The output of this ore is likely to diminish soon, as the surface workings are nearly exhausted. For the working of the deeper deposits on proper lines, special knowledge and considerable capital would be needed. Wolfram in moderate quantities has also been found at Puket, on the west coast of the Siamese Malay Peninsula, and this mineral is said to be fairly widely distributed throughout the Peninsula.

CHINA.—According to the U.S. Consul at Chungking a business man connected with a large German electrical company, which recently underbid all competitors, stated that his house was willing to wait 25 years, if necessary, for the profits which it hoped to get eventually by selling now at about cost price. Although the expediency of such a campaign remains to be proved, the example set in principle affords encouragement to firms to extend their activities, although, perhaps, by less costly methods.

Book Notices.—Whitaker's Almanack for 1915 (2s. 6d.), is the 47th annual appearance of this well-known book. It is as valuable as ever, indeed at such times as these perhaps one has even more occasion than usual to refer to it, for it contains much information regarding the Navy and the Army, and their prominent personnel, and, of course, chapters relating to the great war. A great deal of matter is also available regarding the various colonies, foreign countries, University and educational matters, the Civil Service, railway matters, &c. But Whitaker's Almanack requires little commendation at this date.

requires little commendation at this date.

Aluminium: Facts and Figures.—The pocket-book of data concerning aluminium, issued by the British Aluminium Co., Ltd., of 109, Queen Victoria Street, E.C., has evidently filled a want, and the appreciation with which it was received has prompted the company to produce an enlarged edition, in the form of a neat binder containing 56 pages, and distinguished as Publication No. 147. This has the advantage that any pages containing matter in which the user is specially interested can be withdrawn and the remainder kept on file, and additional pages can be inserted when available. The particulars are of great variety, covering all usual shapes of aluminium parts, special sections, rods, tubes, cables, overhead lines (regulations, sags, &c.), and a list of other publications issued by the company. Users of the metal will find it invaluable.

Scientific Papers of the Bureau, No. 227: "Measurements on Standards of Radiation in Absolute Value"; No. 228: "An Experimental Study of the Koepsel Permeameter"; No. 229: "Various Modifications of Bismuth-Silver Thermopiles having a Continuous Absorbing Surface." Washington: Government Printing Office.

Hindley Gas Engines.—In MESSRS. E. S. HINDLEY AND SONS' advertisement appearing in the last few issues of the Review, the illustration shows a 4-cylinder engine, whereas the letterpress describes it as a six-cylinder. Lest any reader should think that the firm does not make sets above four cylinders, we are asked to state that the letterpress was correct, but a wrong block was sent for use.

Trade in 1914.—Messrs. Richardsons, Westgarth AND Co., LTD., report that in their turbine department, at Hartle-pool, their output of ships turbined in 1914 was 43.000 I H.P. The output of complete sets of marine engines and boilers at the Middlesbrough works was less than usual, comprising only four sets, having a total of 6,000 I.H.P. On the other hand, the output of marine boilers was the highest on record. In addition to the nine boilers required with the complete marine sets put of marine boilers was the highest on record. In addition to the nine boilers required with the complete marine sets supplied, the firm have supplied other nineteen, varying in diameter from 15 ft. down to 11 ft., and representing a total of 13,950 I.H.P. for the boiler shop output. To this are to be added six of their "Nesdrum" water-tube boilers for land work, having a total of 2,000 I.H.P. In land work they have been kept fully occupied, and for the last few months have had to work double shift upon urgent orders for Government and other work required for early delivery. In addition to other plant they have supplied three large surface condensers each capable of condensing 80,000 lb. of exhaust steam per hour for the new turbine power station being erected for the Buenos Ayres suburban system, also one surface condenser to deal with 150,000 lb. of steam per hour for the Newcastle-on-Tyne Electric Supply Co.'s extensions at the for the Newcastle-on-Tyne Electric Supply Co.'s extensions at the Dunston power station, and another similar condenser for the Manchester Corporation Stuart Street power station. In iron and steel works plant, Messrs. Richardsons, Westgarth & Co. have completed a number of large metal mixers, including one having a capacity of 500 tons of molten metal for a Midland firm, one of 400 tons capacity for a local works, and another of 175 tons capacity, also for the Midlands. Two large sets of hydraulic plate shears have also been supplied to a local steel works.

MESSES, MIRRLEES, BICKERTON & DAY, LTD., Hazel Grove, Stocknort Disseled ill engine makens state that the year 1914 was a

Stockport, Diesel oil engine makers, state that the year 1914 was a record one as far as output of engines was concerned, their last completed extensions having been available and fully occupied. As in former years, orders were obtained from practically all parts of the world, and repeat orders have been consistently sent by old oustomers; the placing of an engine in a new district has resulted in further orders from the same district. During the year the firm have been engaged on a large number of engines for the British and Foreign Governments, and although since war was declared there has been a falling off in orders from private customers generally, the large amount of work the firm have in hand for the British Government has enabled them to keep their works fully employed. They state that contrary to what would have been expected the high price of fuel oil ruling at the early part of the year did not cause any falling off in orders for Diesel expires and expected the high price of rue of ruing at the early part of the year did not cause any falling off in orders for Diesel engines, and it is significant to note that since the declaration of war the fall in the price of fuel oil, which commenced about midsummer, has still continued, and there appears to be no danger whatever of an increase in price. There seems no doubt that orders, which are being hung up owing to the war, will be placed immediately after that lease and that a continued revised of presentity way confidently. its close, and that a continued period of prosperity may confidently

be anticipated.

MESSES. MATHER & PLATT, LTD., of Park Works, Manchester, report that under the circumstances they have had a very satisfactory year's business in all their branches. During 1914 they have completed and delivered a number of high-speed enclosed self-lubricating vertical duplex gas engines. The electrical department has been exceptionally have generally in connection with the completed and delivered a number of high-speed enclosed selflubricating vertical duplex gas engines. The electrical department
has been exceptionally busy, especially in connection with the
electrification of mines, collieries and textile factories, both at
home and abroad. Many other industries have also seen the
advantages of a clean and economical source of power, notably the
flour millers, and they have just completed the electrification of a
flour mill, where the power required is in the neighbourhood of
2,000 B.H.P. During the past year the firm have supplied turbine
pumps for increasing duties. Large numbers of their multichamber type pumps have been installed in collieries, where the
duties have frequently been in excess of 1,000-ft. lift. They have
further installed pumps of similar type for hydraulic purposes,
generating a pressure head of 1,800 ft. (800 lb.). This firm's textile department, which specialises in the complete equipment of
works for bleaching, calico printing, dyeing and finishing, has felt
the effects of the war more than any other department, but until
the outbreak of hostilities the business had been quite satisfactory.

MESSHS. W. C. Mabelin & Co., of Glasgow, report that the year
was a very busy one in the fitting of electrical installations for
marine work. The principal installations of the year have been
those on the Q.T.S.S. Aquitania and the T.S.S. Transylvania, both
for the Cunard Line, and the Royal Holland-Lloyd liner Tubantia.
During the year no fewer than 20,000 electric lights have been
installed, together with electric motors of approximately 3,500 H.P.,
varying in size from † H.P. to 50 H.P. each, also about 3,000 electric
bells. Other activities are shown by the fact that some 300 telephones, 110 electric clocks, and 500 fire alarms have been installed,
and a beginning has been made in electric heating and cooking,
which is now past the experimental stage. The prospects for 1915,
while satisfactory, are unsettled owing to the war, but a busy
period is looked f

Half-Watt Lamps.—We remarked some months ago that we expected the life of half-watt lamps to exceed the average that we expected the life of half-watt lamps to exceed the average period guaranteed by the makers. Some particulars have come to hand with regard to an installation of 14 110-volt, 500-watt Osram half-watt lamps in a large paper mill, where large temperature variations were experienced and the lamps were subjected considerable vibration. Only two of these lamps had a life of less than 1,200 hours, and 10 were still in use after burning from 1,300 to 1,870 hours. The average life of the 14 lamps was over 1,500 hours, and the candle-power had not diminished appreciably. If these results are attained in the early days of the half-watt lamp, we may look forward with confidence to future records.

Calendars and Diaries.-Messes. C. Isler & Co., LTD., Bear Lane, Southwark Street, London, S.E., have issued a large illustrated show-sheet with calendar for 1915.

From the Electric Construction Co, Ltd, of London and Wolverhampton, we have received a handy little vest-pocket calendar and diary for 1915, with daily engagement space. It is exactly similar to that issued by the company last year.

MESSES. POPE'S ELECTRIC LAMP Co., Ltd., have prepared an attractive calendar for 1915. A block of daily slips with large and lear fearing in fixed to a cardboard hear which takes the form

clear figuring is fixed to a cardboard base which takes the form of a lighthouse in which a British-made "Elasta" lamp lights the way. The firm have also published a series of coloured picture postcards, each of which advertises some particular quality of these

lamps.

MR. H. J. HAWKINS, of 42, Cheapside, E.C., sole representative for Messrs. Horace Green & Co.'s motors and dynamos, has sent us some telephone reminder pads, and he offers similar sets to any electrical contractor applying for same. Owing to the great demand for his firm's machines, Mr. Hawkins has opened a London stockroom, from which delivery can be given of any standard size motor up to 15 H.P. for the usual London voltages.

Mysers Aleren Herbert Ltd. of Coventry have sent us one

MESSRS. ALFRED HERBERT, LTD., of Coventry, have sent us one of their wall calendars for 1915. It is in the now familiar size and style, with clear figuring, on monthly sheets, each of which has a half-tone illustration of the firm's machine-tool manu-

factures.

THE GENERAL ELECTBIC Co., LTD., of 67, Queen Victoria Street, E.C., have sent us one of their very useful deak blotter wallets; also a set of 1915 engagement slips for use on the file

messes. McClure & Whitfield, of Stockport, have sent us as usual one of their handy pocket diaries for 1915, with insurance

usual one of their handy pocket diaries for 1915, with insurance coupon. The opening pages contain descriptive matter and tabulated prices relating to the "Mersey" generators and motors.

MESSER. MATHER BROS., of 35-36A, Farringdon Street, London, E.C., have sent us a wall calendar with monthly sheets for 1915.

MESSER. VENNER&CO., of 6, Old Queen Street, S.W., have sent us as a Christmas souvenir a neat leather "sovereign purse" for bank notes, which we shall be glad to carry about in the hope of being able to use it some day. We understand that similar gifts have been dispatched to all the usual recipients, and the stock is now practically exhausted; but if any have gone astray, the senders will be glad to be informed of the fact. The customary jou desprit is this year omitted in view of the exceptional circumstances, but the hope is expressed, in which we share, "by this time next year to have good reason for being extra funny, to make up for lost time."

HART ACCUMULATOR Co., LTD., Marshgate Lane, Stratford, E.

—The desk blotting-pad issued by this firm, now a hardy annual,
has just been received. Each sheet of blotting bears a complete calendar for 1915.

Catalogues and Lists.—Messrs. Bagshawe & Co., Ltd., -Illustrated leaflet showing their chains for elevators, Dunstable. conveyors, &c.

MESSER, DONOVAN & Co., 47, Cornwall Street, Birmingham.— Illustrated price leaflet relating to motor-starters. A number of blotter cards showing their motor starters, conduits, fuses and other specialities.

THE SUN ELECTRICAL Co., Ltd., 118 and 120, Charing Cross Road, London, W.C.—Twenty-four-page catalogue of Sun electric luminous radiators, fires, convectors and factory type radiators, of British manufacture. All types are illustrated, and prices are given. Copies of the list can be obtained on application.

THE GENERAL ELECTBIC CO., LTD., 67, Queen Victoria Street, E.C.—"Surprise" envelope advertising the Osram lamps, and neat folder giving prices. The company will supply these to contractors

over-printed with name and address.

ABO LAMP LOWERING GEAR Co., Railway Appliances Works,
Darlington.—Four lists for insertion in their catalogue, showing ABC LAMP LOWERING GEAR Co., Railway Appliances works, Darlington.—Four lists for insertion in their catalogue, showing several new designs of arc and metal-filament lamp-lowering gears for span wire service in streets, and a low-priced gear for works, yards, picture houses and theatres. A light No. 4 gear is intended to take the place of Continental gears not now available on the English market. The lists are illustrated and priced.

MESSES, CROMPTON & Co., LTD., Chelmsford.—20-page illustrated descriptive list (No. A 2) dealing with their standard A.C. polyphase induction motors. Detailed particulars and prices are tabulated for motors designed to work on two or three-phase 40, 50 or 60-cycle circuits, at pressures from 100 to 600 volts. Dimensions

60-cycle circuits, at pressures from 100 to 600 volts. Dimensions and shipping information are also tabulated. A separate list contains particulars of motors and generators in stock.

Russia.—H.M. Consul-General at Moscow (Mr. C. Clive Bayley) reports that an Englishman established in Moscow wishes to get into touch with United Kingdom manufacturers who would be willing to send representatives to Russia. He is prepared to do introductory work free of charge and to accompany such representatives on visits to buyers in other important commercial centres in Russia. Electric lamps and fittings are in great demand at the present time. Communications should be addressed to the British Consulate-General, Moscow.—Board of Trade Journal.

Holidays.—The works and offices of the Phoenix DYNAMO MANUFACTURING Co., LTD., Bradford, will be closed to-day and to-morrow, January 1st and 2nd, for the New Year holidays.

The works and offices of MESSRS. FERRANTI, LTD., at Hollingtood, are closed from last night until Monday morning next, for the holidays.

Dissolutions and Liquidations. - DRYERS, LTD., Manchester.—The affairs of this company are now in the hands of a Receiver (Mr. A. H. Chalmers, Fenwick Street, Liverpool), but we understand that an arrangement will probably be made under which creditors will not suffer.

NATIONAL ENGINEERING Co., LTD.—This company is winding up voluntarily, with Mr. W. B. Ransom, of 52, Queen Victoria Street, E.C. as liquidator. A meeting of creditors was held on

December 29th.

December 29th.

STREET LIGHTING Co., LTD.—A meeting will be held at 8, Fenwick Street, Liverpool, on January 29th, to hear an account of the winding up from the liquidator, Mr. W. Blease.

FELGATE INSTALLATION Co., LTD.—This company is winding up voluntarily, with Mr. A. G. West, of Market Place, Reading, and 95, Cannon Street, E.C., as liquidator.

BEDGLO, LTD.—This company is winding up voluntarily, with Meeers. E. J. Walker, of 5, Castle Street, Liverpool, and P. Hutchinson, of 89, Chancery Lane, Ardwick, Manchester, as liquidators. A meeting of creditors is called for January 5th.

MELDEUM, BEOS., LTD., Timperley, Manchester.—Last day for proofs for dividend, January 12th. Liquidator, Mr. T. Gregory, Parr's Bank Buildings, 3, York Street, Manchester.

ELECTEC STEEL FOUNDRIES, LTD., Darlaston.—First meeting of creditors and contributories, January 8th, at Carey Street, W.C.

creditors and contributories, January 8th, at Carey Street, W.C.

Private Arrangements.—W. B. PARKER, 21, Bond Street, Leeds, electrical engineer.—The creditors interested herein were called together recently, when a statement of affairs was presented which showed liabilities of £1,805. The indebtedness to the trade was £1,039, and there were cash creditors for £267. There were also partly secured cash creditors for £571, the securities held being estimated at £73, thus leaving £498 to rank. In addition, there were fully secured creditors for £240. The assets were estimated to realise £1,561, from which had to be deducted £19 for preferential claims, leaving net assets of £1,542, or a deficiency of £263. The debtor commenced business in 1901 at his present address. After some four or five years the business was taken over by the Standard Engineering Co., Ltd. In 1909 that company was wound up, but all the creditors were paid in full, and company was wound up, but all the creditors were paid in full, and there was a surplus of assets remaining. Since that time the debtor had continued the business on his own account. The turnover of the business had averaged £3,000 per annum, upon which a profit of from £200 to £250 a year had been made, exclusive of the drawings. An offer was made of a composition of 13s. 4d. in the £, payable by four quarterly instalments. No security could be offered outside the estate at the moment, and the offer therefore was not accepted. Owing to pressing creditors a deed of assignment had already been executed, and that deed it was decided to confirm. A committee of the principal creditors was also elected. confirm. A committee of the principal creditors was also elected, and it was stated that the trustee and committee would endeavour to obtain a guaranteed offer of a composition.

War Turbine Contracts.—Messrs. Boving & Co., LTD., report that the volume of their orders for water turbines and turbo pumps has been well maintained. Recent orders include the following :-

One double-wheel spiral Francis turbine of 2,500 H.P., 800-ft, head, for the Nichi-Bi Electric Co., Japan.
One 900-H.P. impulse-wheel, 510-ft. head, for the Simla Municipality, with two exciter turbines of 30 B H.P., each, and pipe-line of 16-ft. diameter (repeat order).

order).

Three spiral double discharge Francis turbines, 3,850 n.p. each, under a head of 400 fs., and two of 170 n.p., for the Kyushu Electric Light and Railway Co., Japan (repeat orders).

Mount Cyell Mining and Railway Co., one impulse turbine, 170 n.p., 260-ft. head (repeat order).

Orders for Boving "Victoria" turbo pumps include:-

One of 200 G.P. m., 197.-it. head, one of 600 G.P.M., 900-ft. head, through Bruce Peebles & Co. (sixth and seventh repeat orders), for the Lothian Coal Co. Two pumps, 500 G.P.M., 850-ft. head, for Hurriladih Colliery, India (through the British Westinghouse Co.).

One pump, 1,100 G.P.M., 133-ft. head; one pump, 2,280 G.P.M., 62-ft. head; one pump, 184 G.P.M., 775-ft. head; for Willams & Robinson.

Two vertical shaft-sinking pumps, 1,000 G.P.M., 60-ft. head, and a repeat order for two similar pumps for Dick, Kerr & Co.

Two pumps, 830 G.P.M. each, 475-ft. head, for the British Westinghouse Co., also for Hurriladih Colliery.

One pump, 5,600 G.P.M., 45-ft. head, for Okura & Co., London.

Trade Announcements.—Mr. John W. Mayall has resigned his position of Birmingham branch manager for the A.E.G. Electric Co., Ltd., and is commencing business from to-day as electrical factor under the title of Mayall & Co., at 32, Corporation Street, Birmingham (Telephone: 3498 Central). Manufacturers lists and factors terms are invited.

THE WORTHINGTON PUMP Co., LTD., are removing from Queen Victoria Street to India House, Kingsway, W.C., on January 4th. Telephone Nos. 3048, 3049 and 3050 Holborn.

MESSES. H. HARTJEN & Co., of 35-37, Noble Street, London, E.C., ask us to state that regular supplies of their insulation leads are now being resumed by them.

Bankruptcy Proceedings. - WM. WALKER, lately trading as David Smith & Co., at 2 and 3, Red Lion Court, Fleet Street, E.C., electrician.—This application was again before Mr. Registrar Linklater last week at the London Bankruptcy Court. The case was reported in the ELECTRICAL REVIEW, of the 4th ult., and it will be remembered that the Registrar then granted an adjournment to enable the Osram Lamp Works, Ltd., to consider an offer submitted by the bankrupt. Mr. Tindale Davis now appeared for the company, and intimated that his clients declined accept the offer. His Honour remarked that the fact that an offer had been made was some evidence of means, and he should

suspend the discharge for two years with liberty to the bankrupt to apply within one year for an amended order if he could show 10s. in the £, when the discharge would be granted subject to that condition.

Meter Approved.—The B. of T. has approved of the B.A.C. single-phase watt-hour meter, type H.T. motor pattern, deposited on March 2nd by the ELECTRICAL APPARATUS CO., LTD. The company will send full particulars of the instrument to any

LIGHTING and POWER NOTES.

Aldeburgh.—Storm Damage.—During the recent storm the roof of the local electricity works was blown off, falling into a private garden.

Arbroath. – - RATING APPEAL. - The appeal of the Arbroath Electric Light and Power Co. against the amount of the valuation of the works and mains was held at the Court of Sessions last week. The Court upheld the judgment of the Valuation Committee, fixing the valuation at £1,100.

Aylesbury. - Power Supply. - The U.D.C. has arranged to supply current to the printing works of Mesers. Hazell, Watson & Viney at 11d. per unit, with a minimum annual payment of £200, the charge to be subject to increase or decrease proportionate to the price of oil being above or below the standard price of £3 10s. per ton. To meet this demand and that of any additional power consumer a power cable is to be laid, at an estimated cost of £670.

Ballyconnell (Co. Cavan).—Mr. Arnold, of Slieve Russell House, recently inaugurated the new electric lighting system. The contractor was Mr. J. C. Cave, electrical engineer, of Belturbet.

Ballymena (Co. Antrim).—The B. of G. has installed an electric plant for lighting the board room and the infirmary.

Barking.—PROPOSED LOAN.—The electrical engineer is to report upon the question of an application being made for a further loan on the electric lighting account.

Belfast.—Workhouse Lighting, &c.—The Council has instructed the Tramways and Electricity Committee to consider the desirability of reorganising the electrical department and to report thereon to the Council.

The B. of G. at its last meeting adopted the recommendation of

the Finance and Works Committee that electric light be the illuminant for the Workhouse premises. The engineer's report respecting the equipment of the Workhouse, at an estimated cost of £23,000, with the object of effecting an economy in expenditure and improvement in the lighting and heating was deferred, the present time not being opportune; any alteration in the meantime is to be carried out by taking current from the Corporation, and the cables laid so as to form part of any future

Bispham.—The U.D.C. has decided to increase by £60 the amount which the L.G.B. has been asked to sanction for electric lighting mains along Blackpool Road to "Greenlands," this being this being the difference between overhead work and underground cables

Brentford.—Infirmary Lighting.—The experiment of substituting electric light for gas in two blocks at the Brent-ford Infirmary is considered to have shown very good results.

Burton-on-Trent.—The Gas and Electricity Committee has opened showrooms for fittings and appliances at the corner of Station Street and Guild Street.

Canada.—The Hydro-Electric Power Commission of Ontario is taking steps to ascertain the consensus of opinion among people now engaged in electrical work as to the advisability of introducing legislation requiring that only licensed electricians shall install wiring, and that only approved material shall be sold.

-ANNUAL REPORT.-The accounts of the heltenham.-Corporation electricity undertaking for the year ended March 31st showed that the revenue was £24,826, and expenditure £10,241, leaving a gross profit of £14,585, as compared with £13,595 in the previous year. After payment of interest and other outstanding charges, the surplus available was £1,944. The units sold were 2,063,938, against 1,905,134 in the previous year.

-The Corporation has granted permission to Croydon.the County of London Electric Supply Co., Ltd., to supply certain premises in Hermitage Lane, Upper Norwood. The borough elec-trical engineer reported that the premises are so situated that it is extremely difficult for the Corporation to give the supply.

Earlestown and Newton-in-Makerfield. -SCHEME.—Mesers. R. Evans & Co., Haydock, having intimated their inability at present to supply electricity to the Council, the latter has decided to confer with Mr. Lacey, with a view to pushing on with its own scheme.

East Ham.—RESTRICTED LIGHTING.—On the suggestion of the engineer and manager the Electricity Committee has decided to make no charge to the hirers of arc lamps during the period such lamps are not in use owing to the police restrictions, but to extend the agreement from the date upon which it would ordinarily expire for a similar period to that for which no charge

Finchley.—There was a debit balance of £2,116 on the last year's working of the electricity undertaking.

Hawarden.—Proposed Loan.—The R.D.C. has applied to the L.G.B. for sauction to borrow \$5,840 for the purpose of installing electricity plant.

Hebburn-on-Tyne.—Gas-Driven Plant.—At Messrs. Palmer's shipbuilding yard an installation is being made of a large gas-driven power plant, in connection with which the National Gas Engine Co., Ltd., has secured the contract for six 1.500-H.P. gas engines to drive alternators, and one engine of 1,000 H.P. to drive a direct-current generator. All the engines will be of the tandem vertical type.

Ilford.—The Electricity Committee has decided to fit two boilers with air bridges, the trial of this apparatus having given satisfactory results in the reduction of smoke

Llandudno.--Proposed Plant Extensions.—The U.D.C. has considered a report by the electrical engineers on extensions at the Council's electricity works. The engineer recommends the installation of a 200-kw. Diesel set, and estimates a saving of \(\frac{1}{2} \)d. per unit on the additional supply, if it is installed. The matter was deferred to a special meeting of the Council.

London.—Islington.—Loan Sanction.—The L.C.C. has sanctioned the borrowing of £4,975 by the Borough Council

for the electricity undertaking.

HAMPSTEAD.—The B.C. has decided to contribute \$10 towards the cost of the appeal against the Ilford and Long Eaton and the engineer and manager has been authorised to attend the

case and to give evidence if desired.

SOUTHWARK.—The Electric Light Committee has had under consideration the advisability of revising the rates for the supply of energy with the view of increasing the revenue of the undertaking, and although it is aware that the present may not be considered an ideal time for increasing prices, it proposes to make certain slight variations in the scales for lighting and power, to take effect as from January, 1915. It is estimated that this proposal will augment the revenue of the undertaking by from \$450 to \$500 a year.

Manchester.—Effect of the War.—The Electricity Committee reports that since the commencement of the war the output of electricity has increased from 3 to 5 per cent. over the corresponding periods of last year, which is attributable to increasing demands for power required in executing Government contracts. The highest load recorded in one hour, being the maximum simultaneous demand on all the generating stations, reached 50,310 kw. on the 18th. The greatest output for one day was

670,070 units on the 22nd.

Despite increased burdens due to the war, the Committee will maintain its rate-aid contribution of £30,000 as promised. Rather over 20 per cent. of its employés have joined the Colours.

Richmond (Surrey). - CINEMA INSTALLATION .-December 24th the New Royalty Cinema at Richmond was opened. The electrical installation is supplied from the mains of the The electrical installation is supplied from the mains of the Richmond Electric Supply Co. at 220 volts for lighting and power purposes, duplicate sets of motor-generators being installed, each with an output of 100 amperes at 70 volts. Two bioscope machines and a lantern are provided in the bioscope chamber, the operating switches being centralised on a polished slate switch-board. The lighting of the auditorium is on the inverted system, with 10 300-C.P. suspended bronze bowls; a dome in the roof is illuminated by 60 concealed lamps, while three-light flambeau torch fittings are provided for side lighting. Inverted lighting has been adopted in the foyer and entrance, and candle fittings in the lounge and tea rooms, the lighting scheme harmonising throughout lounge and tea rooms, the lighting scheme harmonising throughout with the decerations. The contractors for the whole installation were Messrs. G. Weston & Sons, Ltd., of Fenchurch Street, E.C.; the fittings were supplied by Messrs. Peyton & Peyton, Birmingham, and an electrical recommendation of the street of an electrical vacuum cleaning plant by Messrs. Stott, of Oldham.

Morecambe.—The T.C. has authorised the purchase of new condenser for the electricity department.

New Zealand .- Owing to the increased demand for lighting and power in Auckland, the City Council is increasing its generating plant at the city power station, practically doubling its capacity; the first sub-station for the distribution of power in the suburbs is to be erected at Newmarket.

Tamworth.—The T.C. has granted the Co-operative Society permission to run an electric cable underground from their premises at Colehill to newly acquired property, subject to an annual payment of £1, and an undertaking not to sell electricity or to permit it to be used on the premises other than those in the Society's own occupation, and to remove the cable on six months' notice.

Tarporley.—An electric plant for lighting and power has been installed at the premises of Messrs. Cluett. This is the first introduction of electricity in the town.

Tynemouth.—Workhouse Lighting.—The Works Sub-Committee of the Guardians has under consideration the question of wiring the administrative block at the workhouse.

Walthamstow.—The Public Lighting Committee has decided to urge the L.C.C. to postpone the introduction of the London Electricity Supply Bill.

Willesden.—There was a surplus of £1,606 on the working of the electricity undertaking for the year ended March 31st last, and the Electricity Committee has decided to transfer 31st last, and the Electricity Committee has decided to transfer this amount to reserve account. The District Council has been recommended to renew its contract with the Tudor Accumulator Co. for the maintenance of the Salusbury Road sub-station battery for a further period of 10 years, at the rate of £116. The Electricity Committee has decided to make an allowance for energy not consumed by the public electric lamps, owing to the restricted lighting, based on the average cost per unit as given in the accountant's report for 1913-4. Reporting in connection with the proposal of the local Board of Guardians to discontinue the use of energy supplied by the District Council and to use its own generating plant, the Electricity Committee states that although it considers the Guardians to be bound by the contract, it does not think any action should be taken to enforce it. The Committee however, recommends the Council to give the Guardians a stand-by supply. It is proposed to light the new Small-Pox Hospital by electricity. electricity.

TRAMWAY and RAILWAY NOTES.

Australia.—Electric Vehicle.—The Sydney Municipal Council has purchased an electrically-driven motor lorry, fitted with an Edison battery, for £620.

-The revenue account of the Corporation Belfast. tramways for the eight months ending November 30th shows a credit balance, after allowing for fixed charges, of £17,783.

Colwyn Bay.—TRAMWAY EXTENSION.—The extension of the electric tramway line from Station Road to the Queen's Hotel, Old Colwyn, is being carried forward, and one of the tracks is already completed.

Continental Notes.—GERMANY.—UI the 288 companies operating tramways on March 31st, 1913, with a total mileage of 3,116 miles, 155 were operated and owned by private companies, and 133 were operated under public ownership. According to the *Railway Review* (U.S.A.)*, the mileage was distributed in the Empire as follows:—Rhine Province, 783 miles; Westphalia, 332 miles; Province of Brandenburg (including Berlin), 274 miles; Saxony, 234 miles; Bavaria, 116 miles; Alsace-Loraine, 85 miles; Grand Duchy of Baden, 81 miles; distributed through other parts of the Empire, 1,161. Of the 2,221 miles of sailways in Pynasia 1113 miles ware broad gauge and 1,108 were Continental Notes.—Germany.—Of the 288 comthrough other parts of the Empire, 1,161. Of the 2,221 miles of railways in Prussia, 1,113 miles ware broad gauge and 1,108 were narrow gauge. Electric traction has been slowly displacing the other systems. While in 1901 there were 101 miles of horse-car lines, in 1912 this had decreased to 25 miles. In 1901 there were 83 miles of steam-car lines, and in 1912 only 44 miles.

Liverpool.—TRAMWAY RECONSTRUCTION.—In connechiverpool.—IRAMWAY RECONSTRUCTION.—In connection with the proposed reconstruction of the Prince's Road tramway, a further report has been submitted to the Committee by the city engineer, in which he estimates that the cost of the scheme recommended would be £11,990, as compared with £11,100 for relaying the lines in their present position. In his previous report the engineer suggested that the track should be relaid so as to adjoin thelewest footwalk of the boulevard. The adoption of the scheme recommended would reduce the noise to a minimum and give facilities for attaining a speed of 20 miles as hour give facilities for attaining a speed of 20 miles an hour.

London.-L.C.C. - The Local Government Records and Museums Committee recommends that an appeal be made at the Quarter Sessions against the fourth supplemental valuation list of the Borough of Islington, as a comparison of the values of the tramways in Islington for 1912-13 and 1913-14 showed a reduction in the rateable value in the latter year, and that application should subsequently be made for the case to stand over pending the decision of the House of Lords against the judgment

of the Court of Appeal in regard to the assessment of the Council's tramways in Islington.

The Highways Committee proposes to equip the Balham car-shed to accommodate 48 trailer cars; the three petrol-electric cars recently tried by the Council are to be altered for use as tractors for shunting the trailers at the depôt, which is not electrically equipped.

It is proposed to electrify, on the underground conduit system. the horse tramways in Grange Road, Southwark Park Road, and Rotherhithe New Road, at a cost of £62,500 for track work, £6,650 for cars, £5,450 for cables, ducts, &c., and £100 for sub-

Manchester.—Effect of the War.—The general manager (Mr. McElroy) of the Corporation tramways, has submitted a report as to the effect of the war upon the finances of the department. Since the first four months of the war there has been a large decrease in the receipts, as compared with the previous year, and it is anticipated that at the end of the financial year the income will be £900,000, or £50,000 below the estimate.

Notwithstanding the increased expenditure owing to allowances to the men who have joined the Colours, and the engaging and training of a new staff, and the reduced revenue, Mr. McBiroy considers that the Tramways Committee will, at the end of the year, be in a position to pay £100,000 in relief of the rates, and place £50,000 to renewals, &c., fund, instead of the estimated £102,000.

Stoke-on-Trent.—TRAMWAY ACCIDENT.—Last week a serious accident was caused by a car which ran away down Porthill Bank, eventually leaving the rails and coming to a standstill against a shop. The driver died almost immediately as the result of his injuries, and the conductor and two passengers were also injured. The cause of the accident has not been ascertained, but it is suggested that the driver suddenly became ill, and that possibly he was struck by the brake handle.

TELEGRAPH and TELEPHONE NOTES.

Illicit Wireless Installations.—A motor-cycle expert named A. G. Cooks, who was court-martialled on December 5th at Hull and sentenced to six months' imprisonment for the unlawful possession of wireless telegraph apparatus at Filey, was released on December 24th, after serving only two weeks of his sentence.

A lady inspector employed by the Liverpool Corporation, in the course of her duties, noticed something suspicious in the freplace of a private house and gave information to the police, who found that unauthorised wireless apparatus had been concealed in the chimney.

Storm Interruptions. - During the violent storm which took place on Monday evening much damage was done to telegraph and telephone lines, and communication was temporarily interrupted in many districts. It was reported that two-thirds of the provincial telephone wires were blown down, the worst effects being experienced in the North and Midlands. Serious interruptions took place on the Continent; all the Dutch wires were broken, and communication with France and Belgium was very much hamnered. hampered.

Telegrams in Code.—Permission to use the four codes originally authorised will probably be extended to telegrams to the Dominion of Canada and the British West Indies at an early date, when the Censors throughout the Empire have received copies of the codes

CONTRACTS OPEN and CLOSED.

Aldershot.—January 5th. 1,000 tons of pea coal, for the Electricity Department. Particulars from the Electrical

Australia.—Sydney.—March 15th. Municipal Council. Transformer testing apparatus. Specification from City Electrical Engineer. A copy can be seen at the Board of Trade C.I. Branch in London.

ADELAIDE.—January 27th. Accumulators, and power board, for Postmaster-General. See "Official Notices" December 18th.

February 10th. Testing instruments, for Postmaster-General.

See "Official Notices" to-day.

Birkenhead.—January 12th. Twelve months' supply of electric motors and motor-starters, from \(\frac{1}{4}\) to 15 HP., for the Corporation electricity supply. See "Official Notices" Dec. 18th.

- January 25th. General stores, for the Crovdon. -Corporation Tramways Department, for a year. The Manager, Thornton Heath.

Dublin.--January 8th. Tenders for electric light wiring for the new Metropolitan Police Barracks, Great Brunswick Street. Office of Public Works.

Edinburgh.—Corporation. Tenders for the electric lighting installation at the new workshops, King's Stables Road. Mr. F. A. Newington, engineer, Dawar Place.

Glasgow.-Mr. Lackie, the electrical engineer, has been instructed by the Electricity Committee to prepare specifications and tenders for the plant required for the first section of the new power station at Dalmarnoch.

Hemel Hempstead .- The Joint Hospital Board will shortly invite tenders for the installation of a telephone system at

Hong Kong.—January 15th. Two 1,500-kw. (2,000 K.V.A.) turbo-alternators with condensing plant and switchboards, E.H.T. cable, sub-station switchboards and transformers, for the North Point generating station. See "Official Notices" Dec. 18th.

Leeds. - January 22nd. Overhead electrically-driven travelling crane, coal and ash-conveying plant, for Electric Lighting Department. See "Official Notices" D.cember 11th.

Leyton.—U.D.C. Repairs, &c., to cooling tower, for Lighting Committee. See "Official Notices" December 18th.

London.—L.C.C.—January 26th. Platelaying, &c., for electric tramway, Grove Road and Burdett Road, &c. Specifications, &c., from Mr. G. W. Humphreys, County Hall, Spring Gardens, S.W.

January 12th. Two steam turbo-generators of 8,000 kw., with auto-transformers, &c., for Greenwich generating station, for tramways. See "Official Notices" to-day.

Manchester.—January 19th. Tramways Committee. (a) Permanent way special track work, and (b) permanent way points, tongues, and hardened steel centres. Specifications, &c. (£1 ls. returnable), from Mr. J. M. McElroy, general manager.

Shanghai.—January 12th. 68 three-phase induction motors, various sizes between 5 and 60 B.H.P., with slide rails and liquid starters, for Municipal Council. See "Official Notices" December 25th.

Spain.—Tenders have lately been invited by the municipal authorities of Palenzuela (Province of Palenzia) for the concession for the electric lighting of the town during a period of six

Tunbridge Wells.—January 26th. Cooling tower and pipework, two water-tube boilers, economisers, mechanical stokers, pipework, and feed heater, for Borough Electricity Works. See "Official Notices" to day.

CLOSED.

Atherton.—The U.D.C. has accepted the tender of Messrs. G. Hanshett, Barratt & Co., of Pendleton, for the supply of three 275-K.v.A. transformers.

Barking. — The U.D.C. Electricity Committee has sceepted the tender of Messrs. Babcock & Wilcox, at £235, for fitting a chain-grate stoker to a boiler.

Belfast.--Messrs. Johnson & Phillips, Ltd., have secured the contract for the supply and erection of main three-core paper-insulated lead-covered and armoured cable for power purposes, V.I.R. cables to motors and starters, power distribution blands, and the lighting installation in connection with the complete electrical equipment of the new works at Magheramorne, near Belfast, of the British Portland Cement Manufacturing Co., Ltd.

-The Tramways Committee has accepted the tender of Mr. John Crook for laying steam pipes at the new tram-car shed in Shifnal Street, and that of Messrs. H. Bessemer & Co. for the purchase of scrap metal.

Canada.—A contract has been placed with Messrs. Escher, Wyss & Co., of Zurich, for two 2,250-H.P. turbines for the new hydro-electric power station of the Hydro-Electric Power Commission of Ontario, at Eugenia Falls, Ont. The machines will work at a speed of 900 revs. per min., and under a head of 540 ft.

East Ham.—The T.C. has been recommended to accept the tenders of Messrs. Allen & Son at £620 for an electric motor, and at £60 for fixing the same.

London.—Fulham.—The London Education Committee has received the following tenders for installing electric light in connection with the remodelling of Star Lane School, Fulham:

COnnection with the femodeliting of Star Dane School, Putham .—											
Defries & Goldman, Ltd	£2°5	Harrison & Co.				£341					
Tyler Apparatus Co., Ltd.	294	A. Newman	• •	• •		851					
A. Hawkins & Sons	299	G. Weston & Sons,			••	3 3					
R. H. & J. Pearson, Ltd.	312	Johnson, O'Sulliva		ю.	• •	886					
Kent & Co	827	A. C. France & Son				483					
Foote & Milne, Ltd	334	H. Dakin & Co., L	td.	٠.	••	761					

Preston.—The contract for the erection of new car-sheds at a cost of £4,416 has been let to Messrs. Croft & Sons.

tafford.—The T.C. has accepted the tender of Messrs. Siemens Bros., Ltd., for a motor-driven centrifugal pump for the electricity works, at £54.

FORTHCOMING EVENTS.

Electro-Harmonic Society.—Friday, January 1st. At Holborn Restaurant. Smoking concert. (See "Notes" to-day.)

Association of Engineers-in-Charge.—Saturday, January 2nd. Social.

Association of Mining Electrical Engineers (Warwickshire and South Staffordshire Branch).—Baurday, January 2nd. At 5.30 p.m. At the Imperial Hotel, Tempie Btreet, Birmingham. Paper on "Automatic Protective Devices," by Mr. C. Jones.

Royal Institution of Great Britain.—At 3 p.m. At Albemarle Street, W. Juvenue I extures by Prof. C. V. Boys, F.R.S.

Saturday, January 2nd.—On "Fluids in the Home."

Thursday, January 5th.—On "Heat in the Home."

Thursday, January 7th.—On "Electricity in the Home."

Saturday, January 9.h.—On "Light in the Home."

Rontgen Society. Tuesday, January 5th. At 8.15 p.m. At Institution of Electrical E-gineers, Victoria Embankment, W.C. Continuation of discussion on the "Localisation of Foreign Bodies by X-Rays."

Greenock Electrical Society.—Thursday, January 7th. At 7.45 p.m. At 21, West Stewart Street. Paper on "Developments in the Electrical Industry," by Mr. D. McDougail.

NOTES.

The War-Telephones Wanted .- We have pleasure in publishing the following letter, and we hope that there will be an immediate response to the request which it contains:

"I have had the following letter from a major of the Royal Field Artiflery, at present training new units at Farnborough:

"As perhaps you are aware, this war consists of the employment of the three T's, namely, Trenches, 'Fillery and Telephones. We are very good at trenches; in time we shall make good Artillerymen, but they will never make good Telephonists unless they get Telephones, of which I see no likelihood in the immediate future. Can you suggest any means by which we could be lent, or given, any telephones or buzzers, preferably of military design, to further the training of our men? They would be returned to the owners on receipt of the proper telephone equipment from the military authorities, but, as I have already stated, they have none I should be very grateful if you could at present to spare. suggest any means of obtaining these necessary instruments.

"I rather feel if you could insert this letter in your 'Correspondence' columns as an appeal, there might be some of your readers who have unsaleable, but useful, instruments which they could offer to lend, or give, under the circumstances. I shall be very glad to have any offers which you may receive. My 'phone number is Victoria 977.

"R. MACLEOD, Secretary.

"National Service League, " 72, Victoria Street, S.W., " December 30th, 1914."

"Electrical Review" Index.—The Index for Vol. 75 of the ELECTRICAL REVIEW will be published with our next

Electrical Development Committee. — The first meeting of the Development Committee of the Incorporated Municipal Electrical Association was held at the Institution of Electrical Engineers, on December 11th, 1914. The Committee was formed as a result of a resolution moved by Mr. W. A. Vignoles (chief engineer, Grimsby electricity department), at the Annual Convention held in Birmingham in June last, its object being deal with any matter tending to encourage the vec of electricity deal with any matters tending to encourage the use of electricity from public supply mains. The membership of the Committee, as originally constituted, was as follows:—Messrs F. Ayton, J. W. Beauchamp, A. S. Blackman, R. A. Chattock, A. C. Cramb, Councillor Crowther, J. E. Edgeome, S. E. Fedden, F. M. Long, Ald. Pearson, H. Faraday Proctor, H. Richardson, T. Roles, A. H. Seabrook, Ald. J. P. Smith, and W. A. Vignoles.

The Council of the I.M.E.A. had appointed Mr. W. A. Vignoles as hon. secretary, but on account of his absence on military service, this work was taken over, pro tem, by Mr. J. W. Beauchamp.

At the meeting held on December 11th, Mr. S. E. Fedden (general manager, Sheffeld electricity department) was elected chairman. deal with any matters tending to encourage the use of electricity

manager, Sheffield electricity department) was elected chairman. Mr. S. T. Allen (Wolverhampton) and Mr. H. F. Street (Southampton) ton) were also elected members of the Committee. It was decided. if possible, to co-opt members representing the various associations connected with the supply of electricity, and allied interests, and the secretary was instructed to approach these bodies with regard It was decided so soon as p to the election of representatives. ticable to form certain sub-Committees to deal in a specialised manner with various questions of interest at the present moment.

Following a suggestion in a communication from Mr. F. Ayton (Ipswich), it was proposed to form Technical sub-Committees with object of investigating problems of interest which might arise during the year, and with a view, if possible, to presenting the results in the form of reports, to be discussed at the Annual Convention of the Incorporated Municipal Electrical Association. Informal discussions were also held with regard to the future policy of the Committee and the objects to which primary attention should be directed.

The next meeting will take place in January next, when it is hoped that work upon some of the above objects may be put in hand. A brief report of the operations of the Committee will be communicated to the Electrical Press from time to time.

International Engineering Congress, 1915.—The Committee of Management of the Congress informs us that some confusion seems to have arisen in the minds of some engineers between the International Electrical Congress, which it was proed to hold in San Francisco in September, 1915, and the Interposed to hold in San Francisco in September, 1910, and the inver-national Engineering Congress, which is to be held during the same month.

We are asked, therefore, to repeat the statement which we have already made, that owing to the unfortunate situation existing in Europe, and the impossibility of convening the International Electro-technical Commission, under whose authorisation the Electrical Congress was to have been held, it has been decided by the governing body of the American Institute of Electrical Engineers to postpone indefinitely the holding of the Electrical Congress. This does not affect the International Engineering Congress, which goes ahead as originally planned. Full information may be obtained by inquiry at the following address: International Engineering Congress, 1915, Foxcroft Building, San Erancisco, Cal., U.S.A.

Inquiries. — Makers of "Grimshaw's" tape, and "Buttner" regulating switches are asked for.

Electro-Harmonic Society.—This Society holds a smoking concert to-night, at the Holborn Restaurant (King's Hall), smoring concert to-night, at the Holooff Restaurant (king's Hair), commencing at 8 o'clock. The preliminary programme is as follows:—Mr. John Collett (tenor), soloist, St. Paul's Cathedral; Mr. Alten Engles, baritone; Mr. Wilfred Alderton, handbells; Mr. Rupert Hazell and Mr. Fred Rome, humorists; Mr. Alec Chentrens, Anglo-French comedian; Mr. Arthur Thomas, musical clown; Mr. George Bolton, entertainer at the piano; solo pianoforte and accompanist, Mr. Bernard Flanders, A.R.A.M.

Portable Electrical Workshops.—In a letter pubished in the Times, a member of the A.S.C. Mechanical Transportings:—"Our company consists of 98 lorries, and this includes two store wagons, three first-aid lorries (breakdown cars), one office, and two repair workshops. The two travelling workshops are wonders, and are in duplicate. They are fitted with electric light and have on board lathes, drilling and boring and althing machines electric vivators forces anytic and executions. and have on board latties, drilling and boring and machines, electric riveters, forges, anvils, and everything required in a workshop, even melting pots for running in Babbitt's metal in the worn-out bearings before being turned up afresh. The machines are driven by a motor which is driven by a small motor engine. There are other wagons which carry heavy stuff such as portable forges, two or three grindstones, spare springs for cars, crow-barr, jacks and heavy tools, and hundreds of other things."

The Norwegian Aluminium Industry.—According to present prospects, the production of aluminium in Norway to present prospects, the production of aluminum in Norway is going to make great progress in the near future. The Anglo-Norwegian Aluminium Co. has just completed new works at Vennesla, Christiansand, which will have an output of 2,000 tons of aluminium per annum, the percentage purity of the metal being as high as from 99—99½ per cent. At the present time the company is engaged upon the manufacture of carbon electrodes company is engaged upon the manufacture of carbon electrodes for its own requirements.

for its own requirements.

Another company, in which chiefly French capital is interested, has bought the works of the Hardanger Electrical Iron and Steel Co. for the purpose of turning them into a manufactory for aluminium cables. The same buildings are to be used, with extensions. Electrical energy will be derived from the Tysse Waterfalls Co., which had a contract with the previous owners of the works, that has been transferred to the new company.

The Norske Nitrideaktieselskab, which has a capital of £555,555, has completed its plant and works at Evdshave in the neigh-

has completed its plant and works at Eydehavn, in the neigh-bourhood of Arendal. The work has been pushed on with all possible speed, but still it does not seem to have kept pace with possible speed, but still it does not seem to have kept pace with the development and progress of that particular manufacturing branch, with which it was going to start, viz., the fixation of atmospheric nitrogen, as this has been considerably improved during the comparatively short building period. The new process which was to have been employed has in the meantine been greatly improved, and a new type of electrical furnace has been invented which seems to present our read advantages in comparation rented, which seems to possess great advantages in comparison th the old type. This has caused some delay and induced the with the old type. This has caused some delay and induced the company to wait for the results of a long series of experiments, which are now being carried out, before the manufacturing is started. This was quite unforeseen, and it has therefore been decided in the meantime to organise the works and use the plant

and energy for the production of aluminium.

The reason why this course has been followed is that a group of financiers, who have a large interest in the Nitrideaktieselskab, own some aluminium patents, which will thus be turned to account.

Electric Vehicle: British Experience.valuable feature of the Electric Vehicle Committee's official journal, of which the first number was recently noted in these columns, is of which the first number was recently noted in these columns, is the inclusion of the opinions of actual users of the electric vehicle in this country. The lack of British experience and data has been a great drawback in the past. It is, therefore, interesting to note that Messrs. Harrods, Ltd., who now use a number of electrics for business purposes, state that these vehicles are all giving entire satisfaction: they are used to replace horses on town deliveries, and have been found much cheaper for that purpose. Again, Messrs. Liberty & Co., after a trial of an electric delivery was tate that, compared with a petrol car doing similar work, their experience was that, besides economy in tire mileage and lubricants, experience was that, besides economy in tire mileage and lubricants, its running cost was two-thirds less.

Messre. J. Pullar & Sons refer to the reliability and low running costs of an electric vehicle used in London during six months. Another 2-ton van used in Scotland was found to be quite satis factory, especially when its running cost was compared with petrol cars doing the same work.

The Stratford Co-operative Society have used a 2,000-lb. electric

van for some time, and state that the monthly milesge is 1,500; energy cost 871d. per mile (electricity, 1d. per unit); tires, 33; per cent. advantage compared with petrol-driven car tires; maintenance practically nil; speed, 12-15 miles an hour.

Further particulars are also given regarding the experience of Mr. W. T. Robson, of the South Shields tramways, with Edison battery 'buses. Mr. Robson lays stress on the reliability of the least it. battery buses. Mr. Robert lays stress on the remaining of the electric buses and adds his experience that petrol buses were always liable to fail at an awkward time. The electric buses easily run 50 miles in the day on one charge, requiring 13 units in fine weather and from 14 to 2 units per bus mile in dirty weather.

The Glasgow electricity department's 1 ton Edison van is running about 900 miles a month, at a cost of some £240 per annum; previously, a petrol van doing the same mileage was costing £400 per annum.

Appointments Vacant.—Junior assistant electrical assistant electric supply Co.; shift engineer (284) for Dover Electricity Department; fitter-driver (35s.) and switchboard attendant (30e.) for Clacton U.D.C. (this appointment is open to British and Belgian subjects); temporary engineer in charge (282, 282) for Respondent engineer-in-charge (£2 2a) for Borough of Bermondsey. Particulars are given in our advertisement pages.

Notices. — Northampton Polytechnic Institute, St. John Street, E.C. A course of six lectures on "Transformer Design" will be given by Mr. W. C. Kennett, at 8.45 p.m. on Wednesdays, beginning January 6th. Particulars are given in our advertisement pages to-day.

A Large Gas Power Plant.—The directors of Messrs. Palmers Shipbuilding and Iron Co., Ltd., have put in hand extensive improvements and additions to the iron and steel works at Jarrow, with the object of effecting large savings in the cost of steel production. The improvements already undertaken include a large gas-driven power house, in which will be installed approxia large gas-driven power house, in which will be installed approximately 15,000 B.H.P. of gas engines, all driven by the waste gases from the blast furnaces; and a new lay-out of the heavy cogging mill, which it is intended to drive electrically, together with the conversion of all the steel works auxiliaries from steam to electricity, by which large savings in the cost of coal will be effected. The installation of gas engines and gas-cleaning plant is the largest hitherto ordered in this country. There is every reason to believe that some of the plant will be in operation after midsummer.—Financial Times.

summer .- Financial Times.

Institution Notes.—Institute of Marine Engineers. —On December 14th Mr. F. L. Martineau read a paper on "Power Steering Gear." The author stated that actual experiment under comparable conditions had shown that sensitive gear saved as much as 6 per cent, in the distance travelled, as compared with as much as 6 per cent, in the distance travelled, as compared with ordinary steering gear; the Hele-Shaw-Martineau electro-hydraulic system ensured immediate response to the slightest movement of the wheel, and in smooth water the rudder could be set so accurately that the compass showed no deviation for as long as ten minutes at a time, without moving the rudder. On the same boat, with steam steering gear, the gear was moved 20 times a minute on the average. In the new gear lubricating oil was the operating medium instead of water, doing away with wear and corrosion and preventing trouble from freezing. Some gears had run for three years without needing attention except occasional cleaning of the commutator and lubrication of a few pin joints. commutator and lubrication of a few pin joints.

In future all meetings will be held at the new premises of the

Institute on Tower Hill.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL RRVIEW posted as to their movements.

Central Station Officials.—MR. T. S. WALLIS, late of Stuart Street station, Manchester, who has just returned from Sweden, wishes to communicate with Mr. Frank Nicholls. the latter send us his address?

The staff of the Stretford U.D.C. has presented a pair of Royal Crown Derby vases to Mr. Robret Rowland, resident engineer of the electricity works, as a wedding gift.

-The Times correspondent at Rome states that General.among the Italian Senators who are to be nominated on New Year's Day is SIGNOR GUGLIELMO MARCONI.

Obituary.—We regret to learn of the death which occurred on December 1st at sea (near Port Said) of MR. CHARLES WHEUSA-NICHOLL, A.M.I.E.E., of Teddington, aged 38 years. The deceased gentleman was on his way to take up an important

appointment at Bombay.

MR. FRANK SUMNER, engineer to the City of London Corporation, passed away on Saturday last, at the age of 49 years, after

several months' illness.

MR. J. F. Albright,—We deeply regret to learn as we go to press that Mr. J. F. Albright passed away on Wednesday last at working at the early age of 57 years. The funeral his residence, at Woking, at the early age of 57 years. The funeral takes place early to-morrow, Saturday, at St. John's Church, Woking, at 2.30 o'clock. Mr. Albright's connection with electrical woring, at 2.50 o clock. Mr. Albright's connection with electrical engineering matters dates back over nearly 35 years, to when he was associated with the Swan and Edison Companies, and, subsequently, the amalgamated Edison & Swan United Co. Later he was prominently identified with the firm of Crompton & Co., the Drake & Gorham Power Co., and was actively interested in various electric supply schemes at home and in the Colonies. In recent years ill-health had prevented him from taking any very active share in business affairs, but he held at the date of his death, the chairmanship of the British Electric Transdate of his death the chairmanship of the British Electric Transformer Co. and the Kent Electric Power Co., and was on the board of the Melbourne Electric Supply Co., Ltd., Gravesend and Northfleet Electric Tramways, Ltd., and the Midland Electric Corporation for Power Distribution, Ltd.

NEW COMPANIES REGISTERED.

Acton Battery Co., Ltd. (138,700).—This company was registered on December 21st, with a capital of £300 in £1 shares, to carry on the business of manufacturers of, and dealers in, electric and other batteries, electric appliances, machinery, accessories, apparatus, incandescent lampe. &c. The subscribers (with one share each) are:—L. E. Tucker, Broad Street House, E.C., clerk; W. Faller, Coleridge House, Crouch End, N., gentlemas. Private company. Table "A" mainty applies. Registered office, 39, Churchfield Road, Acton, Middlesex.

Gwalchmai Electricity Supply Co., Ltd. (138,726).—This company was registered on December 2004, with a capital of £1,000 in £1 shares, to take over from W. E. Parry and E. S. Lance the business of producers and suppliers of electric light and power carried on by them as Gwalchmai, Anglesey, as the Gwalchmai Electricity Co. The subscribers (with 26 shares each) are:—W. E. Parry, 31, High Street, Menai Bridge, cabinet maker; E. S. Lance, 25, Mostyn Street, Llandudno, engineer. Private company. The number of directors is not to be less than two or more than five; the first are W. E. Parry and E. S. Lance: qualification, £25. Solicions: Chamberlain & Johnson, Llandudno.

ors: Chamberlain & Johnson, Liandudno.

Standard Woodwork Manufacturing Co., Ltd. (138,718).—
Registered December 21st, by Jordan & Sons, Ltd., of 116-17, Chancery Lane,
W.C. Capital, £50,000 in 5,000 8 per cent. cumulative preference shares of £6
each and £5,000 ordinary shares of £1 each. Objects, to take over the business
of woodworkers, cabinet makers and manufacturers, carried on by the
Standard Woodwork Co., Ltd., at Park Royal, Willesden, to carry on the
same and the business of woodturners, joiners, sawyers, carpeners, cabinet
makers, manufacturers of toys and games, switchboards, bell-cases, electric
batteries and other accessories for telephones and electric bells, and tele
graph apparatus of all kinds, gas and electrical engineers, &c., and to adopt an
agreement with L. Godsell. The subscribers (with one preference share each)
are:—J. Goodland, 9, King's Bench Walk, Temple, E.C., barrister: L. Godsell,
Hunstanton, Norfolk, gentieman. Private company. The first directors (to be not
less than two or more than six), are L. Godsell (permanent) and J. Goodland,
qualification, £1,00; remuneration of chairman, £160 per annum; of other
directors, £100 each per annum. Solicitor, E. J. Howard, 12, The Common,
Ealing, Middlesex.

Britannic Electrical Co., Ltd. (138, 742)—This commons

Ealing, Middlesex.

Britannic Electrical Co., Ltd. (138,743).—This company was registered on December 23rd, with a capital of £5,000 in £1 shares, to carry on the business of patentiess, manufacturers, and repairers of, agents for, and dealers in engines, machines and mechanical instruments and inventions, whether driven by gas, steam, petrol or electricity, and tools, dies and castings, cycles, motor-cycles and motor and cycle cars, £0., and to enter into an agroement between H. Dare, C. A. Wareing, E. Radnall, J. Satchwell, R. Satchwell, and F. H. Alston. The subscribers (with 250 shares each) are:—E. A. Radnall, Ashgrove, Ward End, Birmingham, manufacturer: O. A. Wareing, 13, Gladstone Road, Gravelly Hill, Sirmingham, sanitary engineer. Private company. The number of directors is not to be less than two or more than five; the first are K. A. Radnall (chairman), J. Satchwell, H. Dare, C. A. Wareing and F. H. Alston (manager); qualification, 250 shares; remuneration as fixed by the company. Registered office, 33, Newhall Street, Birmingham. Birmingham.

J. Barwell & Co. (Lighting), Ltd.—This company was registered on December 2nd with a capital of 25,000 in £1 shares, to carry on the business of manufacturers of and dealers in lamps, brackets, globes, films, shades, glasses, burners, meters, carbons, switches, stoves, pipes, wires, electric light and gas fittings, &c. The subscribers (with one share each) are:—F. H. Barwell, Worccetter Works, Clement Street, Birmingham, manufacturer; H. Barwell, Worccetter Works, Clement Street, Birmingham, manufacturer. Private company. The number of directors is not to be more than three: the first are F. H. Barwell (permanent managing director), and H. Barwell: remuneration of F. H. Barwell, £5 per week. Registered office, Worccetter Works, Clement Street, Birmingham.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Cunningham, Ltd.—Second mortgage dated December 16th, 1914, to secure £1,200, charged on company's undertaking and property, present and future, including uncalled capital, subject to a certain debenture. Holder: E. H. Hawkins, 4, Charterhouse square, E.C.

Electrical (Installations), Ltd.—A memorandum of satisfaction to the execut of £100 on December 10th, 1914, of debentures dated December 5th, 1906, securing £2,000, has been filed.

Pernambuco Tramways and Power Co., Ltd.—Issue on December 1st, 1914, of £550 dependences, part of a series of which particulars have already been filed.

Coatbridge and Airdrie Electric Supply Co., Ltd.—Further charge on company's undertaking and property, present and fusure, including uncalled capital and the Coatbridge and Airdrie undertakings, &c., dated December 14th, 1914, supplemental to charge dated October 17th, 1906, to secure £1,250. Holders: County of London Electric Supply Co., Ltd., Moorgate Court, Moorgate Place, E.C.

CITY NOTES.

Costa Rica Electric Light and Traction Co., Ltd.

THE annual meeting was held on December 23rd at Dash-

wood House, E.C.

The CHAIRMAN (Mr. W. F. LEESE) said the company had been passing through a very anxious time, and no doubt they had an anxious time in front of them, but looking at the effect which the war had had on the world generally, they had reason to congratulate themselves that, so far, they had not suffered greatly. The net profit last year had amounted to reason to congratulate themselves that, so far, they had not suffered greatly. The net profit last year had amounted to £26,351, against £23,875 for the previous year; an increase of £2,476. On the other hand, there had been increased expenses which absorbed all but £719 of the increased net profit. The net surplus was £8,056, and it was proposed to carry the whole of that amount to the credit of discount and commission on debenture issues account. The lighting revenue had kept up fully, and the cooking and heating part of the business was very satisfactory. They were making about £3,000 a year out of that, and owing to the shortage of fuel in the country electrical cooking was an absolute necessity. Their country electrical cooking was an absolute necessity. Their manager fully anticipated that in the near future they would obtain at least £5,000 a year from that source of revenue. He (the Chairman) believed that as time went on that figure would be increased. With regard to competition, that was still in statu quo, but should they have to meet a competitive supply he was convinced that there was enough business in the country for both.

Mr. Frederick Davies seconded the motion, and the report

was adopted.

International Light and Power Co., Ltd.

The directors first report for the period from February, 1913, to June, 1914, states that the results obtained, considering the depressed financial conditions, have been in the circumstances satisfactory. The net profit for the period, after payment of interest on debentures and London and Canadian administration charges, is £23,714. The available balance is £19,053. The preference dividend has absorbed £15,166, and £3,887 is to be carried forward. to be carried forward.

Reserves for renewals and general purposes amounting, when converted, to a total of approximately $\pm 5,000$, have been set aside by the subsidiary companies before dividends were declared by them.

The company owns all the debentures and shares of the following companies:-

The company owns all the depentures and shares of the following companies:—

Venezuela Electric Light Co., Ltd.—The absorption by this company of a competing undertaking in Caracas has had a beneficial effect on the development of the lighting business. Electric power is now obtained from two hydro-electric stations, the combined capacity of which is sufficient to take care of the expansion of business for some time to come. The possibility of exceptional droughts, however, makes the installation of a stand-by plant, using either coal or liquid fuel, desirable. The stability of political conditions in Venezuela has proved of advantage to the development of business, and although the European war has affected the economic resources of the country, a steady increase in the net returns of our undertaking is anticipated for the current year. Important renewals in sub-stations and distriction system have been carried out successfully.

Compañia de Electricidad de Mérida,—Although Mérida is outside the more disturbed districts, recent events in Mexico are responsible for an almost unprecedented drop in exchange, still further accentuated by the European war. This company, generating its own power, has to import, besides coal, a number of manulactured articles from various countries, and is therefore greatly suffering from the disturbed state of affairs throughout the world. The gross earnings in local currency continue to increase notwithstanding the unfavourable conditions prevailing, but the net returns in sterling have fallen considerably below our estimate, the loss on exchange account exceeding £10,000 for the period under review. The new installation for the power house has been unavoidably delayed on account of the European war.

Compañia Luz y Fuerza de Paraná,—Results from operating the Paraná (Argentine Republic) property have been satisfactory, showing an increase of 18 per cent. in gross earnings, and 46 per cent. in net earnings over house have been completed, which will permit further development of the

Mr. FOLLETT HOLT presided at a meeting of the shareholders of the company held on December 21st at 9, Cloak Lane, E.C. He said that as all the members of the board and the majority of the company held on December 21st at 9, Cloak Lane, E.C. He said that as all the members of the board and the majority of the shareholders were resident in Great Britain, they had considered it desirable to hold the meeting in London, previous to the annual general meeting in Canada, in order that the report might be considered and proxies instructed to act in accordance with any resolutions passed. The Chairman made a brief statement concerning the three undertakings in which their capital was invested. The Venezuela, and since the absorption of the undertaking, referred to in the report, theirs was the only distributor of electricity for lighting purposes in that city of about 80,000 inhabitants. The Merida Electricity Co, owned an electric lighting and power system in the city of Merida, Yucatan, Mexico, where the population served was approximately 52,000. With the exception of an insignificant plant of about 25 kw. theirs was the only supply company in that city. Their power-house, when taken over, required very considerable overhauling, and a new generating unit had been secured in Europe and would soon be in operation. The better economy of this generating unit should result in a marked decrease in the fuel consumption. The Paraná Light and Power Co, owned and operated electric light and power and gas works in Paraná, the capital of the Province of Entre Rios, Argentina. The population served was approximately 42,000. Electricity was generated there by means of producer gas engines, and the growth of business had been so rapid since the property was acquired that it had been no report to add a new engine of 300 kw. capacity, which was now in operation. This would enable them to efficiently handle the large increase in business which had come during the past two years, and to take care of further increases which were expected in future. The gas branch of the business, although losing ground to the electrical department in the lighting field, had more than made up these losses by the reposition of sales of the shareholders were resident in Great Britain, they had for the period under review consisted only of debenture interest. The report indicated the serious effect on earnings which the very heavy fall in exchange in Mexico had caused, and served also to explain the absence of dividends from that company. The net currency earnings had been reduced by the largely increased cost of working, and the balance had been again cut into on conversion into sterling by the heavy fall in exchange. Profits from Merida had therefore been nothing

like what they were expected to be, and what they should be. They could only exercise their patience and hope for a speedy solution of the difficulties in which Mexico was at present involved. Meanwhile, to compensate to some extent for the depreciation of the currency, a new tariff had been established and higher prices in currency were now obtained for electricity sold, and this was expected to materially assist in bringing the net receipts back to a more fair and normal standard. The sum received from the Parana Co., amounting to £9,565, included interest on the total loan of £18,000, two years' dividends at 8 per cent. per annum on the shares, and one year's interest on the debentures. These latter were purchased in July, 1913, and they had therefore received only twelve months' interest thereon. Concerning the outlook, they anticipated that, notwithstanding the difficult economic conditions created throughout the world by the European war, their undertakings at Caracas and Parana would show substantial progress during the current year. With reference to the Merida Co., the situation was more difficult. The profit in sterling, which principally concerned them, was bound up almost entirely with the rate of exchange, and they therefore sincerely hoped that the political and financial situation of Mexico had reached a turning point, and would show improvement during the current year. Mexico had reached a turning point, and would show improvement during the current year.

Cape Electric Tramways, Ltd.

MR. LUDWIG BREITMEYER (Chairman) presided at the annual meeting, held at 1, London Wall Buildings, E.C., on December 23rd.

ber 23rd.

The Chairman said that the war had startled the world, and had disturbed business everywhere. It involved every state and dominion in the British Empire. Their industry could not hope to remain unaffected during this tremendous struggle, more particularly as South Africa had been called upon to play its part in the defence of the Empire by the expedition against German South-West Africa, and had, in addition, also found itself faced with local rebellion. This rebellion had now collapsed, and South Africa had escaped a very great danger. The war had, so far, not interfered with their tramway working, which up to latest advices was showing fairly satisfactory results, but there were signs ahead of some shrinkage of their revenue, and they must be prepared for possibilities in the future not now in evidence. interfered with their tramway working, which up to latest advices was showing fairly satisfactory results, but there were signs ahead of some shrinkage of their revenue, and they must be prepared for possibilities in the future not now in evidence. The directors had, therefore, decided to recommend the payment of a 2½ per cent. dividend, instead of 5 per cent., with the hope that better prospects might justify an increase later on. He might tell them frankly that, in view of the strained financial conditions prevailing throughout the world, he and his colleagues felt that it would have been perhaps more prudent and conservative to have retained their cash resources and passed the dividend altogether. They, however, had to remember also the position of the shareholders in these hard times, and after careful consideration they had decided to pay half only. The net profit of £24,618 had been made after paying all fixed obligations, including debenture redemption, and also passing £8,000 to the reserve fund. They had spent considerable sums in the purchase and reconstruction and equipment of the Hout Bay Hotel; also a great outlay was incurred in the installation of a new unit of 500 kw. in the power station at Port Elizabeth, and additions to the rolling stock both at Cape Town and Port Elizabeth. This new unit would meet all the requirements of traffic on that system for some time to come. The general manager there reported most favourably on its running and the satisfactory results he had obtained in economy of fuel consumption. In addition to this expenditure on improvements, they also had to face a steady increase in working costs, due to higher prices of coal and all other materials. Further, the imposition of the new income tax at the Cape cost them roughly £3,000 per annum, and was another burden which the company had to bear. The several schemes of improvement in the Peninsula, contemplated by the Unified Municipality, had been checked by the war, but a municipal loan of £200,000 was to be floated locally

was carried.

The Swiss Oerlikon Machinery Co.

THE report of the directors of the Maschinenfabrik Oerlikon, of Oerlikon, for the year ended on June 30th, 1914, after referring to extensions of the workshops and plant, states that the course of business in the department for general electrical machinery and transformers was good. The apparatus branch produced a new series of oil switches. There was a lack of large contracts for lifting appliances and electromechanical applications, but the small orders notably increased. In regard to turbo-machines, the company was abundantly provided with orders and special mention is reade of dantly provided with orders, and special mention is made of the delivery of various turbo-generators of a total of 11,000

kw. for the Baltic shipyard at Petrograd. A large number of repeat orders was also received. In electro-chemical apparatus, 14 electrolysers of a large type were sold. The department for electric railways was satisfactory both in regard to work carried out and the new orders which were booked, and important repeat orders were placed by a number of transways for normal material. The sales companies abroad, with few exceptions, had been successful for the works. The accounts show gross profits of £130,000, as compared with £119,000 in 1912-13. After allocating £39,000 to depreciation, as against £40,000 to depreciation. £119,000 in 1912-13. After allocating £39,000 to depreciation, as against £40,000, the accounts indicate net profits, including the balance forward, amounting to £51,000, as contrasted with £43,000 in the previous year. The sum of £16,000 has been placed to a war risks' fund, £4,000 to the special reserve fund, and £8,000 to the provident fund for staff and workmen, and the balance permits of the payment of a dividend of 6 per cent. on ordinary share capital of £320,000, as compared with 7 per cent in 1912-13, the loan capital totalling £160,000.

India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.

Major Leonard Darwin presided on December 22nd at the offices, 106, Cannon Street, E.C., over the annual meeting. He began his speech by reiterating the regret which the directors felt so keenly when presenting such a disappointing report to their shareholders. There had been no difficulty whatever in ascertaining the cause of the present troubles, and the cure of the disease, so far as it was carable, ought to present no insuperable difficulties. The first trouble to be mentioned was that due to the war, and here they were dealing with the only part of the disease which the directors could do nothing to alleviate. During the last two months of the year, often its most profitable period, the sale of goods normally supplied to the public considerably diminished, with, of course, a corresponding diminution of profit. But the war had caused them losses in a far more direct way. Not long after hostilities had broken out, it became apparent that the German army was likely to pass through Persan, and their managers at the works took prompt and effective action, largely on their own initiative. Recent events had given them further means of judging of the probable fate of an English manufactory in France if falling under the influence of German culture, and had confirmed the wisdom of the steps taken. The stores were bricked up; the documents were buried; and the managers left the factory when the Uhlans had come within a couple of miles of the works, and when the bridges across the Seine hard by were being blown into the air. Mercifully the German hordes swerved aside at the critical moment, and MAJOR LEONARD DARWIN presided on December 22nd at the Seine hard by were being blown into the air. Mercifully the German hordes swerved aside at the critical moment, and their French factory was now again a running concern, though their French factory was now again a running concern, though hardly yet in thorough working order. Thus the war had resulted in a considerable diminution of profit. But he was bound to state that their worst troubles were those due to other causes. A careful comparison of the accounts of the year, with those of the previous year, showed a marked similarity in all the items except in two particulars. The first of these was the total sale of goods of different kinds. Here the diminution was not only that due to the war, but was also caused by a general slackness of trade in England, and a large and sudden diminution in orders from one important foreign country. Now it was impossible to make all the incidental expenses connected with the manufacture and sale of goods diminish in exact correspondence, and simultaneously with a expenses connected with the manufacture and sale of goods diminish in exact correspondence, and simultaneously with a diminution in the sales; and the result was that the whole profit made seemed to depend on the disposal of the last narrow margin of goods sold. If that margin remained unsold, a loss inevitably followed, and this state of things continued until the necessary readjustments of running costs or turnover could be made. Here then was the cause of a large part of their troubles. The second item in which their accounts showed up very badly was the profits made by their foreign agencies, as they called them. The deplorable conditions existing in South America were known to all, these being the result of commercial depression aggravated by heavy rains. In Australia trade had been bad, partly due to the opposite evil of long-continued droughts. And sales had diminished in both South Africa and India. But this was not all. Certain contracts for lighting towns in Australia, which had proved to be very unprofitable, were made some two years ago, the evil results of which had fallen on this year. It was no use making excuses, for no adequate excuse could be made. All that could be said was that drastic steps had been and would be taken to prevent its recurrence. There was a third item in the year's accounts which must be mentioned, where they hoped to have seen a change as compared with last year's figures but where they had to admit a disappointing simithem in the year's accounts which must be mentioned, where they hoped to have seen a change as compared with last year's figures, but where they had to admit a disappointing simi-larity, viz., the Persan account. Here again excuses were useless, and here again all that could be said was that radical changes in the management had now been effected. But cleaning up a stable was often a costly process, and in this case it had brought to light losses arising out of faulty manu-facture in the previous year. They had hoped at all events to have done far better in the last six months of the year that racture in the previous year. They had hoped at all events to have done far better in the last six months of the year, that was in the period during which the war broke out; and they had now no reason to think that their anticipations would have been falsified if normal conditions had continued to exist. Now for the future. There had been, as he had said, a con-

siderable falling off in sales in certain lines. In other direc siderable falling off in sales in certain lines. In other directions, however, there had been material increases, notably in warlike stores, and in lines opened out to them by the cessation of the German export trade. The total orders on their books were now considerably greater than they were at this time last year, though it should be added that contract work for Government departments was, in many cases, not very profitable. This was, no doubt, partly due to the fact that, in the manufacture of these new lines, it took some time to get into the graphing order, new machinery often having to the manufacture of these new lines, it took some time to get into thorough running order, new machinery often having to be made or bought. And he hoped that the meeting would note that this work of adaptation to the new conditions had thrown an immense strain on the staff, a strain which they had met in the most loyal manner. But would there be a profit declared and a dividend payable a year hence, he would be asked. He did not know.' The price of rubber had been fairly constant, and had given them no trouble; and all had gone well with them with the exceptions which he had fully discussed, and which were, they believed, of a temporary gone well with them with the exceptions which he had fully discussed, and which were, they believed, of a temporary nature. But who would venture to predict the results of this mighty war? Either the long continuation of this struggle, or the sudden cessation, might result in disturbances which no man could now foresee; and their company must be prepared to share in the troubles through which the nation as a whole would have to pass in the future. If no profit was made during the current year, then certainly no dividend would be distributed this time next year, for they would be unable to trench again on their reserves. But as their main troubles were, they hoped, things of the past, there seemed to the directors to be a sufficiently good chance of making a profit in the immediate future to justify the bold policy which they now recommended. Their proposal must, they thought, be in accordance with the wishes of those who had in the past so often advocated the equalisation of dividends out of reserve funds. And he felt that in this time of stress some extra risk might be run to avoid the hardships always inflicted on shareholders by the complete passing of a dividend. dividend.

Mr. C. H. Gray seconded the motion.

Mr. C. H. Gray seconded the motion.

Mr. Flint, who spoke at considerable length, said the one comfort to be found in the report was that it showed some mental progress on the part of the board, in that they recognised for the first time that the reserve fund was available for the purposes of dividend. On one previous occasion, when they had a bad year, £50,000 was taken from the reserve, but they had no dividend, although the directors took their fees from the reserve fund. Now they had again resorted to the reserve fund, and the directors had again taken their fees from the fund. Mr. Flint proceeded to quote from the Indiarubber Journal the results attained by a number of other companies, doing a somewhat similar business, before the war, and also gave extracts describing the booming conditions of the same companies since the start of the war. Coming to the report before the meeting, he asked what had been their progress with regard to their home trade? They were told that the losses were due to the war, to faulty organisation of the French factory, and to foreign agencies; and then they were carried to Australia, South America, Africa and Japan, and told that there had been certain unprofitable contracts. Apparently their difficulties arose from foreign contracts. Another curious thing was that the gentleman who was suppressed to be reconcible for the Persen works had been made. were carried to Australia, South America, Africa and Japan, and told that there had been certain unprofitable contracts. Apparently their difficulties arose from foreign contracts. Another curious thing was that the gentleman who was supposed to be responsible for the Persan works had been made an extraordinary director. He made no comment upon Mr. Smith's management, because he did not know whether he was responsible, and after all, the responsibility for all these difficulties lay on the board. Year after year they had been told that the French factory had not been satisfactory, and now he took it that Mr. Smith had been brought over on the homeopathic principle that like cured like. Whilst he was generally in favour of homeopathy, he did not think this step was likely to be beneficial to the board. He would like to know whether the prosperity enjoyed in the home trade by kindred businesses had been shared in by their company. They had not heard of what had become of the insurance money received from the loss of their ship, but he presumed their losses would have been bigger but for that money having come in. Further, he would like to know something about the Palmer Tyre Co., as he had always protested against the method of secrecy with which that concern was conducted. Another point was that there was no item in the accounts for income tax, although surely on the three years' average they must have paid something. Last year he moved a resolution with regard to the directors' fees, as he felt strongly it would be more inducement to the board if they were paid on a sliding scale, but the directors took alarm at the proposal and regarded it as a vote of want of confidence. He still adit would be more inducement to the board if they were paid on a sliding scale, but the directors took alarm at the proposal and regarded it as a vote of want of confidence. He still adhered to the view that this was the best principle for them, and he would like the question reconsidered. Mr. Flint quoted from the Articles of Association regarding the directors' remuneration, and said that in 1881 a resolution was passed giving the board £2,000 a year with an additional renumeration of 10 per cent. if the net profits were in excess of £31,200 a year. Such remuneration, however, was not to exceed £5,000 a year. Since 1881 the capital had largely increased, and in 1904 a special resolution was passed to the effect that the existing Articles of Association, and all the other existing the existing Articles of Association, and all the other existing regulations of the company, should be repealed, and that the Articles of Association submitted to the meeting should be adopted. That resolution was not confirmed, and, technically speaking, he supposed the directors were not entitled to any fees at all until some resolution had been passed. He felt that this subject should receive attention, although he agreed that, owing to all of them being more or less engaged by the

that, owing to all of them being more or less engaged by the war, the present was not an opportune time.

Mr. W. Thompson asked how the £50,000 was to be drawn from the reserve fund, seeing that they were told that the whole of the reserve was invested in the business.

Mr. Winkley said that all the contracts made abroad appeared to have been failures, more or less, and he would like to know who was responsible for them if the contracts were taken at prices which did not pay, why were they sanctioned by the directors on this side? They were now told that drastic steps were to be taken, but in what direction would they be taken? If they had been unable to keep a fair hold on the business, someone was to blame; and if they had not done this up to now, how were they going to do it in the future? He did not see how they were going to take £50,000 from the reserve fund unless they borrowed from the bank. Although they had £750,000 share capital, £400,000 debentures from the reserve fund unless they borrowed from the bank. Although they had £750,000 share capital, £400,000 debentures and £350,000 reserve fund—which was profit sunk in the business—yet they had also £158,742 debts and loans from the bank owing by the company. It seemed to him as if a sort of rake's progress had been going on, and they wanted to fix responsibility on the person who was responsible and who had created this trouble. No man in business for himself would ever have allowed such a state of affairs to have arisen without going thoroughly into the matter.

Mr. BLAKE remarked that it was common knowledge that

Mr. BLAKE remarked that it was common knowledge that the company was too conservative, especially in regard to its procedure at the works. Many representatives of manufacwho, however, refused to see them. It was well-known in the trade that the company was buying materials at prices much

above what their competitors were paying.

The Chairman said that, with regard to Mr. Blake's remarks, he could only say he really did not think this was the case. He himself had always seen very great care exercised in this matter. As to Mr. Smith, if the shareholders knew the whole story he thought they would take a very different view of the situation. Mr. Smith joined the works in France 55 years ago. For 50 years he had worked for that company, and for 45 years was their manager. About two years ago his health began to break down, and they began to company, and for 45 years was their manager. About two years ago his health began to break down, and they began to take steps to relieve him of his responsibilities, which ceased entirely in April. Now Mr. Smith's health had completely broken down. They had always regarded the position of extraordinary director in the case of Mr. Smith as a small pension for 50 years' service with the company, and also to give to the board the chance of getting a certain amount of information due to his many years' experience. Although it was perfectly true that the Persan factory had been a bad venture perfectly true that the Persan factory had been a bad venture for the past few years yet, on the whole, they had gained very much from the rrench factory, and after Mr. Smith's many years of faithful service he did not think the shareholders would gridge him the small pension in his retirement and broken health if they knew the whole story. It was true that the board had sometimes refused to use the reserve to pay dividends, and that was a question which depended to a certain extent on the cash state of the company. If cash was difficult to get then they could not use the reserve fund. The ship they had lost had been well written down in their books, with the result that the insurance more than covered the loss with the result that the insurance more than covered the loss incurred. Their total loss would have been greater but for the loss of the ship, but it was not advisable to state the exact ratio of their book values to their insurance policies, for reasons which would be quite appreciated by those who did business in this line. Their Silvertown works had done well up to the beginning of the war, but it was difficult to say whether it was doing well or not now. Although they had lots of orders, yet, like other companies mentioned, it was difficult to estimate the profits in view of all the new machinery and the new circumstances which had to be taken into consideration. They were introducing entirely new manufactures, and anyone who had to do with the introduction of new manufacturing methods had to do with the introduction of new manufacturing methods knew how difficult it was to estimate the whole profit at once, but so far as he could say they were making a good profit. There was no mystery about the Palmer tire business; it was a separate department, and it was not advisable to make public all the details of each of their separate departments. It paid 124 per cent. last year, but that was only a book entry, as they held practically all the shares. The reserve fund was built up out of undivided profits, and as he had already said, it depended on the cash state of the company as to the extent to which they could use the fund to pay dividends. They would no doubt have to borrow from their bankers in order to pay the dividend. As to the contracts entered into abroad, of course the Board were solely responsible. If anything went to pay the dividend. As to the contracts entered into abroad, of course the Board were solely responsible. If anything went wrong they were to blame. Their agents were acting under their orders, and if they did wrong the directors had to answer to the shareholders. They could only put the matter right possibly by getting rid of individuals, and also in making stricter rules in settling where their activities should lie. There might have been slackness in that respect in the past, or it might not be right to trust their agents abroad to the extent they had done, but that matter would be carefully looked into, and he felt convinced that there was no chance of such difficulties occurring again.

Mr. C. H. Gray (joint managing director) said he did not know that there was much more to say from the general point

know that there was much more to say from the general point of view. For the last three years he had been intimately con-

nected with what he might call the reorganisation of Persan, nected with what he might call the reorganisation of Persan, and to reorganise a factory was not an easy thing, especially when they had to keep it running at the same time. The personal equation always came in, and one came up against very rough corners, some of which had to be removed. The condition of Persan practically arose from the fact that Mr. Smith was getting older, and could not give the same personal attention to things. Things spread out a little, and touch was lost with details which were so necessary to keep within ones grasp in order to make a thing successful. He was afraid a little more time was taken up in discussing personal equations grasp in order to make a thing succession. He was arrand a little more time was taken up in discussing personal equations than in looking after the work. It was his business to try and smooth over the personal difficulties, and he had now got rid of them and arranged and systematised the factory in such a way as to have accurate knowledge of costs and sales, and all the details necessary to run a business. The war had to all the details necessary to run a business. The war had to a great extent upset the organisation owing to so many of the a great extent upset the organisation owing to so many of the men being at the front, but had it not been for the war he thought he could say with perfect certainty that the organisation was such as to carry on the business successfully. The losses they had sustained in France were greatly due to bad losses they had sustained in France were greatly due to bad work during the past year which had overlapped on to this year. He was at the factory two weeks ago, and believed that under the present halting conditions they were working at a profit. How long that would last depended on the war and on many things, but if they continued as they were working they should show a profit. He regretted the matter as much as anyone, because his father had a great deal to do with bringing forward the French factory, and, therefore, from a personal point of view, he would not like to see the factory in a worse state than he found it.

Mr. Leggett replied to Mr. Flint's point as to director's fees, and pointed out that the remuneration was fully covered by

and pointed out that the remuneration was fully covered by

Article 72.

Article 72.

The Chairman said the income tax was a technical point. The amount estimated on September 30, 1913, was sufficient to meet the income tax actually paid. There had been the same amount of tax paid.

Mr. FLINT said he understood from the Chairman's statement that the tax was paid from the reserve of the previous year, which showed that the profit and loss account was mislanding.

leading.
Mr. Thompson said the shareholders would have the greatest

Mr. Thompson said the snareholders would have the greatest sympathy with Mr. Smith, but they had not the same sympathy with the board. Was it right for them to have allowed Mr. Smith to remain at Persan?

The CHAIRMAN: All I can say is that we are responsible.

Mr. C. H. Gray replied to Mr. Blake, and said they had at Silvertown one of the most efficient buyers he had come across. They might pay more for certain articles, but they did so knowingly because they wanted the best article. Their policy was to get the best article they could for the job, and although

was to get the best article they could for the job, and although they might pay more for some things, they could also buy very cheaply when they wanted to.

The report was then adopted.

On the motion for the re-election of the retiring directors, Mr. FLINT wished to propose an amendment to the effect that the matter be postponed until a further report had been received by the shareholders, showing what class of business had been carried on by the company at a profit, and also containing recommendations as to what should be done in regard to the foreign agencies. to the foreign agencies.
The CHAIRMAN rule

The Chairman ruled the amendment out of order, but pointed out to Mr. Flint that it was open to him to move the adjournment of the meeting.

The motion was then agreed to.

Melbourne Electric Supply Co., Ltd.

MR. J. B. BRAITHWAITE (Chairman) presided on December 21, at Finsbury Pavement House, E.C., over extraordinary meetings of the holders of the consolidated ordinary stock and of the holders of the 7 per cent. first cumulative preference shares of the Melbourne Electric Supply Co., Ltd., when resolutions were passed sanctioning the creation of a further £20,000 7 per cent. first cumulative preference shares of £5 each.

Mr. Braithwaite also presided at the 15th annual general meeting of the company which followed, and in moving the adoption of the report said he had to congratulate the shareholders on a year of continued progress and success. Last year he told them that their progress was a record, and it seemed

he told them that their progress was a record, and it seemed unlikely then that that record could have been surpassed, but the unikely then that that record could have been surpassed, but the record before them that day was an even better one from whatever point of view they looked at it. One of the most satisfactory features was the increasing way in which the small municipalities outside Melbourne were coming to them for bulk supplies. The proposals for the creation of fresh stock would raise the share capital from £450,000 to £750,000, and would raise the share capital from £450,000 to £750,000, and would carry with it automatically the right to issue a further £250,000 of debenture stock. The total capital expenditure during the year had been £185,445, as compared with £160,029 last year, and as their profit had increased by £27,247 it represented a return of about 15 per cent. on the expenditure, although, of course, some of the expenditure had not so far been productive. A great portion of the capital had been spent in connecting new customers to their mains, and in this direction their progress continued to be almost phenomenal. Supplies were now available on 482 miles of streets, there having been an increase of 72 miles during the year. They had put

on 5,495 new customers, as against 4,975 last year. He believed the addition of 5,495 new customers in a year was an absolute record of any company anywhere in the world so far as he knew. That brought up the total number of consumers connected up to August 31 to 19,000, an increase of 40 per cent. during the year, and last year showed an increase was really phenomenal, and at the present moment the number of really phenomenal, and at the present moment the number of consumers connected was over 20,000. To this remarkable increase all classes of business had contributed. The lighting consumers connected was over 20,000. To this remarkating supply had increased very considerably. Last year he told them they had introduced a new power tariff which would enable large consumers of power to obtain it on very reasonable terms, and they looked forward to the new tariff bringing a very large increase of business. He was glad to say the forecast had been fully justified. Last year they had the equivalent of 9,581 horse-power on their mains, whilst on August 31 they had 12,444 horse-power connected, and to-day they had 15,000 horse-power on the mains. Thus they were gradually obtaining a very important power load, and those who knew anything about the technical part of electrical supply undertakings would know what an important factor a good power load was in enabling them to supply units at a reasonable price and with efficiency. Taking the connections altogether they had increased 32 per cent. per year, as against 38 per cent. last year. Not quite the same rate of progress, but on the other hand the total units sold had increased by 43 per cent., as compared with 37 per cent. last year. That was due to the large number of units taken by the new power consumers. The gross revenue had increased by 30 per cent. consumers. The gross revenue had increased by 30 per cent., as compared with 36 per cent. last year.; so that from every point of view they had reason to be satisfied with the progress as compared with 36 per cent. last year.; so that from every point of view they had reason to be satisfied with the progress made. At Melbourne their lighting income had risen from £66,403 to £81,738; the power and heating revenue from £31,403 to £37,466; public supply from £4,623 to £7,017; and supply to municipal trainways from £8,339 to £16,836, which was nearly double. The item of bulk supply, £322, appeared for the first time, but that would considerably increase during the current year owing to the supplies they were now giving in bulk. Meter rents had increased from £4,198 to £6,117; and the total result was that the revenue from Melbourne had risen from £115,288 to £149,959. On the other side, to earn that additional revenue the cost of generation of electricity had only risen from £948 to £1,695; repairs and renewals from £7,297 to £9,233; carbons, lamp renewals, etc., from £4,471 to £4,773; and the total result was that the expenses had risen from £46,707 to £56,757. The net revenue had, therefore, increased from £68,580 to £93,202. At Geelong they had the same pleasant story in a modified form. There was an increase in the lighting supply from £3,503 to £4,119. The public lighting supply had increased from £1,133 to £1,837; and the current supplied to the tramways had increased from £1,100 to 100 to and the current supplied to the tramways had increased from £11,905 to £14,927. The total revenue had increased from £23,935 to £29,161, with the result that the balance carried to profit and loss account was increased from £8,511 to £11,137 This large increase in their consumers had not been obtained This large increase in their consumers had not been obtained without them considering their interests at every turn. His opinion was that the best way to develop a business was to consider the interests of the consumers. Last year he mentioned that they had introduced a new power tariff, which made it possible for large users of power to obtain power on good terms, and during the year they had further modified that tariff in the direction of the very large power consumers, so that they were now getting their current at less price than from any company or local body in Australia. In the same way they had introduced a new graded tariff, which enabled their large lighting consumers to obtain their current on very reasonable terms. They had been anxiously awaiting the time when the company would be in a sufficiently solid posireasonable terms. They had been anxiously awaiting the time when the company would be in a sufficiently solid position to make a reduction in the price to those consumers that in a certain sense did not deserve it—he meant the small consumer, who was not a profitable customer in the ordinary way, since his demand was very small, and the company had to pay for raping and plant and connections, whilst the conto pay for mains and plant and connections, whilst the consumer would, perhaps, only use the light one or two hours a day, and sometimes not at all. At the same time, they had a day, and sometimes not at an. At the same time, they mad always had it on their mind that as soon as possible they would give such consumers some benefit; and now, owing to the economy in generation which they had been able to effect, they thought they were justified in giving them something, and so they gave the local board discretion some time ago to reduce the flat rate from 514 to 54 which was really 10 n.g. The so they gave the local board discretion some time ago to reduce the flat rate from 5½d, to 5d., which was really 10 p.c. The local board felt that they were in a position to do so, and so the new rate would come into force about Jan. 15th of next year. So they were not only improving their earnings and their profits, but they were giving benefits to their consumers all round, owing to the economies which had been effected by putting down this modern type of plant. With regard to the profit and loss account, their revenue was £104.885, against £77.140—an advance of 35 per cent. They had anxiously considered the way to deal with that revenue in a most conservative way, and in a way likely to be for the most permanent interests of the company. After providing for the first debenture stock sinking fund, which is a fixed sum of £2.500, they had an item which appears for the first time, viz., £2.609 98, 6d., which they had applied to a sinking fund for the consolidated debenture stock. The income certificate sinking funds of £1.800 remained the same. During the year they had

reduced a further £1,796 income certificates, leaving the amount outstanding on Aug. 31st of £21,675 out of the original £30,000. Then they proposed to add £5,000 to the general reserve, raising it to £65,000; to carry £5,000 to the suspense account to meet the cost of writing-off sundry items of plant at Melbourne and Geelong which had become obsolete; and to clear up the balance sheet by writing off the expenses of the issue of the 1913-14 debentures, £10,560, instead of spreading the item over a number of years. Then it was proposed to put £10,000 to a dividend equalisation account, so as to do their best to secure the shareholders on a 10 per cent. basis, and, in addition, they increased their carry-forward by £3,300. In conclusion, the Chairman referred to the excellent services of the local board in Melbourne and of Mr. F. W. Clements, the local managing director, and the other members of the staff.

staff.

Mr. R. Percy Sellon (managing director), in seconding the motion, remarked that the year had been one of very exceptional activity. He knew something of the progress of electrical supply undertakings in the country, and in many countries in the world, and so far as he was aware there was no undertaking which had shown for the period under review the progress their Melbourne undertaking had. Mr. Sellon also alluded in eulogistic terms to the good work of the Australian staff and of Mr. W. E. Lane, the secretary, and the staff in London

Mr. Shead congratulated the board on the admirable report, but suggested that the creation of debentures seriously affected the ordinary shareholders. He thought preference or ordinary shares should be issued instead of debentures. He also asked why a public issue of the last debentures was made, instead of the ordinary shareholders being offered them? He saw brokers' commission, advertising, etc., £1,800, and he presumed the Chairman's firm acted as brokers. He hoped the Chairman would not take the mention of that as a personal matter between them, but he had received letters of complaint from Colonial shareholders.

from Colonial shareholders.

The Chairman said the answer to Mr. Shead was simple. A very few years ago their ordinary stock was not worth the paper it was written on, and the only way by which the company could be extricated from its serious financial position was to issue debenture stock. The ordinary shareholders could not take it up, and they had to do the best they could. The ordinary stock had simply been made valuable by the financial arrangements they made under great difficulty. They had issued the stock on the most favourable terms they possibly could, but to have offered it to the Australian shareholders would have been disastrous. With regard to his firm acting as brokers, there had never been any concealment, and one of the reasons why he had been asked to take the chairmanship of the company was that by reason of his connection with the Stock Exchange he might be able to extricate the company from its financial difficulties. He said without fear of challenge that the issues had been made on the most reasonable terms. Had more favourable terms been offered they would have been accepted.

The motion was then carried, and a hearty vote of thanks

was afterwards passed to the board and staff.

Adelaide Electric Supply Co., Ltd.

The annual meeting was held on December 22nd at the offices, Finsbury Pavement House, E.C., Mr. J. B. BRAITHWAITE presiding.

In proposing the adoption of the report (Elec. Rev., Vol. 75, p. 826), the Chairman said that the past year had seen nothing of a striking character, in connection with the company, but a steady continuance of prosperity which it had enjoyed for many years past. There was a growth in every item of net revenue. The lighting receipts had gone up from £58,200 to £74,824; power and heating from £21,800 to £25,067. Public lighting had increased from £4,578 to £5,941. There had also been increases in meter rents and dividends, and in all the total revenue had advanced from £89,591 to £111,985. He thought they would agree that, coming on the top of previous increases, the further increase of practically £22,000, or nearly 25 per cent., was very satisfactory. On the other side, generation of electricity had risen from £21,738 to £24,698, an increase of just under £3,000; distribution had risen from £3,168 to £3,385, an advance of only £200; and repairs and renewals had increased from £6,659 to £8,983. Interest on debenture stock had gone up a little, and the debenture stock sinking fund absorbed £5,360. The net result was that they carried down £40,492 against £37,857 last year. They proposed to pay a final dividend of 5 per cent. and a bonus of 2 per cent. on the ordinary shares, and a final dividend on the preference shares, which would raise their carry forward from £9,864 to £10,815, whilst leaving their dividend equalisation fund of £25,000 intact. They, therefore, started the new year with £35,815 in hand available for dividend account, which went a long way towards securing their dividend for the current year. The other items in the report were equally encouraging. They had added 59 miles of streets in which current was available, about the same as last year, when they added 60 miles; they had added 2,932 consumers—not quite so many as last year, when it was 3,486, but still a very satisfactory record—and the total consumers now connected were 13,192, as compared with 11,354, an increase of 16 p.c. as compared w

previous year. Their total connections, including lamps, had increased by 24 p.c., and the total units sold also by the same figure, and the gross revenue by 25 p.c. They would see that the expenditure of the new capital had continued to produce corresponding results. During the year they had expended £143,036, with the result that they had received additional revenue of about £22,000—approximately 15 per cent. on the capital expenditure, although, of course, the whole of that expenditure had not yet become fully productive. The capital required had been provided in the manner that he foreshadowed at the last meeting. They then obtained power to increase the capital from £400,000 to £500,000 by creating a further 20,000 6 per cent, cumulative preference shares. He told them that they would probably provide the additional capital required by the issue of a portion of those preference shares and by the sale of a further amount of debenture stock. That forecast had been borne out by the result. During the year the ordinary share capital had been raised to £250,000—the full amount. That issue of £50,000 was made at a premium of £3 per share, which gave them £80,000 additional capital, and the balance had been provided by the issue of another £25,000 debenture stock. Last year that stood at £175,000; it was now £200,000, and the further issue of preference shares they were now making would give them a further £25,000 debenture stock available, so that as far as they capital, and the balance had been provided by the issue of another £25,000 debenture stock. Last year that stood at £175,000; it was now £20,000, and the further issue of preference shares they were now making would give them a further £25,000 debenture stock available, so that as far as they could see they had in hand sufficient resources to meet the capital expenditure during the current year, and they were not asking at present for any additional powers. Last year they placed £20,000 to general reserve, raising it to £36,000. They were not very anxious to increase that general reserve, for owing to the short tenure which they had there was the power of purchasing them every two years. That being the case, they were not particularly anxious to show large sums carried to general reserve. They had got a sum which was quite adequate for all contingencies, and in addition they wrote off from the plant items that might have become obsolete. Already they had written off £12,074 on that account. They would continue that policy as portions of their plant became obsolete, by substituting units of more modern construction. At the present time they had in their power-house a good supply of perfectly modern plant of the most economical kind. That was shown by the fact that, although their production of units had increased by 25 per cent., their generating costs had only increased from £21,738 to £24,678, rather less than £3,000. The extraordinary progress which the company was making was shown in the table which appeared in the report, from which it would be seen that from 1904 to 1914 the number of consumers had grown from 585 to 13,192, and the total units sold from 729,821 to 6,740,991. They had had the advantage of a visit during the year from Mr. Clements, their engineer and a member of the local board in Adelaide, and they had been able to confer with him on several matters of importance. With regard to the current year, it was difficult to say what effect the war might have upon their business, or the drought from

of plant, mains, etc

The report was adopted.
Following the re-election of the retiring director and the auditor, a vote of thanks was accorded to the local directors and the staff.

Manx Electric Railway Co., Ltd.

Sir W. H. Vaudrey presided on December 21st, at the offices, Finch Lane. E.C., over the annual meeting. He first apologised for the absence of the Chairman, Col. Sir Arthur G. Boscawen, M.P., who was at Chatham serving as Colonel of the 3rd Royal West Kent Regiment. The Chairman had intended being present at the meeting and had prepared notes for his address, which he (the speaker) proposed to read. Their colleague, Mr. B. E. Greenwell, was also serving his country as Major in the Hants Yeomanry. The war which broke out at the beginning of August, by keeping vast numbers of summer visitors from going to the Island, had played havoc with their receipts. Whilst previous to August they were well ahead of even last year's record takings, and they exceptionally fine summer promised a rich harvest, the exceptionally fine summer promised a rich harvest, the months of August and September, which, of course, always provided their chief revenue, for the reason already mentioned, proved disastrous. The passenger receipts amounted to £24.793, as against £36.642 in 1913 and £30.292 in 1912. to £24.793, as against £36.642 in 1913 and £30.292 in 1912. Goods, live stock, quarries, etc., brought in £2.744, as against £3.518 in 1913 and £4.082 in 1912. They carried 496.568 passengers, as against 704.188 in 1913 and 547.187 in 1912. Their mileage this year was 305,731, as against 364.747 in 1913 and 325.647 in 1912. They earned 19.46d, per mile run from their passengers, as against 24.11d, in 1913 and 22.33d, in 1912, and they carried 1.62 passengers per mile, as against 1.93 in 1913 and 1.76 in 1912. The receipts per passenger carried were

11.98d., as against 1s. 0.52d. in 1913 and 1s. 0.73d, in 1912. The number of visitors to Douglas and Ramsey, as officially advised, between the months of May and September was 413,650, as against 629,617 in 1913 and 597,904 in 1912, the decrease being accountable entirely to the months of August and September; in fact, May to July showed an increase of nearly 15,000. Their gross revenue amounted to £27,537, as against £40,160 in 1913 and £34,375 in 1912. The working expenses totalled £17,391, as against £18,740 in 1913 and £17,669 in 1912. The ratio of working expenses to receipts was 63.15, as against 46.66 in 1913 and 51.40 in 1912. All these unfortunate statistical figures were clearly traceable to the lack of visitors during August and September, and he feared it was small consolation to tell them that in normal circumstances he had no doubt they would have been able to lay before the shareholders a fresh record in earnings. As it was, after providing for the debenture interest to 30th September, they were left with a balance of £3,325 (inclusive of last year's carry forward), and they were therefore obliged to forgo the payment of the preference dividend, a misfortune which had never before occurred to them since the formation of the company. The board thought it right and proper to apprise shareholders of this result of the year's trading at the earliest possible moment, and they therefore issued a circular to that effect in October. The balance of £3,325 they proposed carrying forward, and they could now only hope for a speedy termination of the war, a prompt resumption of normal conditions, and a more encouraging showing next year. Their colleague Mr. Ernest Schenk had changed his name to Ernest Remnant, he was born in England and had always resided here, but since the war broke out he had been troubled with so much correspondence that he determined to adopt his mother's family name.

Mr. Remnant seconded the motion, and the report was adopted without discussion.

Metalite. Ltd.

An extraordinary general meeting was held on Wednesday at the Institute of Chartered Accountants, Moorgate Street, E.C., for the purpose of confirming the resolution passed at the meeting held on Dec. 15th sanctioning the new reconstruction.

Mr. E. C. VINCENT presided.

Mr. ROSENTHAL said he had been asked to raise the question of the payment of the 1s. 6d. per share by the old shareholders. The point was that, however big the inducement might be, the present was a very inconvenient moment for such payment. the present was a very inconvenient moment for such payment in view of the exceptional stress that people were passing through. It seemed unjust that people who had contributed should, as it were, be deprived by one stroke of the pen from any future benefit which might accrue. He considered it only fair that some resolution should be passed safeguarding the interests of the old shareholders, and he suggested that they might be allowed the alternative of getting so many fully-paid shares in exchange for their present holdings. If not that, then they might grant some certain definite period, such as three months after the termination of the war, for such as three months after the termination of the war, for the payment of the 1s. 6d.

The CHAIRMAN said the position was that they were bound by the reconstruction scheme, the terms of which they were all fully aware of. Notice had to be given to the Liquidator, and after that it was up to the new directors to see what could be done, and he would put it to the new board whether in certain cases, where the terms appeared to be somewhat harsh, a short extension of time could not be granted. The suggestion of a date three months after the war was, however, suggestion of a date three months after the war was, however, quite an indefinite period. With regard to the suggestion as to old shareholders getting fully-paid shares, he would remind them that the property was the property of the shareholders, and they had agreed to certain mortgages and charges amounting to something like £30,000. These were in arrears, both as regarded principal and interest. They had eventually got the holders of these charges to waive their security and substitute another security. There was very great difficulty in getting the debenture-holders to take ordinary shares, but they had done so. The reconstruction had been acceded to by all parties and they could not depart one iota from it. As an act of grace the new directors might give an extension of time, but he doubted very much if they would, because if the resolution was not confirmed the Receiver would dispose of the concern, was not confirmed the Receiver would dispose of the concern, lock, stock and barrel. If that were done it meant that the shareholders and the unsecured trade creditors would not get shareholders and the unsecured trade creditors would not get a penny, and the holders of the mortgages and charges would get very little. As regarded the question of issuing fully-paid shares, he would point out that under the scheme the shareholders must put up certain money, and he did not think it was any question of throwing good money after bad.

Mr. W. Stewart said he also had received letters from shareholders, and in these trying times any little latitude which could be granted would be much appreciated. He considered the new directors gentlemen of exceptional business capacity, and he believed they would do the right thing when the opportunity was given them.

The Solicitor remarked that he was perfectly certain any

The Solicitor remarked that he was perfectly certain any application on the part of any shareholder would receive the

greatest possible consideration.

The resolution confirming the previous resolution was then formally proposed by Mr. Stewart and carried.

STOCKS AND SHARES.

Tuesday Evening.

It would beggar the powers of Mark Tapley himself to write a cheerful letter on stocks and shares this week—that is, if he started comparing current prices with those which existed at the beginning of the year. It is not as though the early months were marked by any particular phase of buoyancy that would redeem the drabness of the picture as a whole; although, in this connection, one must recall the remarkable little burst of strength in gilt-edged securities which took place in January and February, when there was such a run upon all investments of this class as the Stock Exchange had not seen for several years. The mark of this, indeed, is left upon not a few of the best kind of securities up to this very day, in evidence of which we may point to the difficulty of obtaining certain electrical supply Debenture stocks of the first order, and to the avidity with which they are bought when they come—as they so rarely do—into the market.

Before attempting to review, through the medium of price variations, the net results of 1914, we may remark that the feature of the industrial markets since the Stock Exchange reassembled after its Christmas holidays is the notable strength of two or three shares connected with electricity supply. Edison & Swan shares have advanced rapidly, the £3 paid putting on 3s. 6d. to 12s., while the fully-paid at 50s. are 10s, higher than they were a week ago. British Westinghouse Preference rose to 2, and there has been a further inquiry for both sorts of Crompton shares. The other industrial companies which stand to benefit by the war are steady, armsments, for example, scarcely moving, though Rubber shares have gone ahead sharply and are a good market, with a fair amount of pressure to buy at prices which, though below existing levels, are substantially higher than those at which present buyers bluntly declined to look at the shares some weeks ago.

The Electrical Supply list contains no movements of particular significance. Westminster Ordinary are 1 higher at 81, and Charing Cross Debenture hardened up to 87. A small seller of County of London 5 per cent. Debenture stock proved enough to put the price down a point. The interest with which London auticipates aircraft invasion is sufficient to still the murmurs that were beginning to arise with reference to the darkened streets and shops; but considerable interest is aroused as to what the next reports of the electrical supply companies will show.

Great Northern Telegraphs fell to 28, a drop of 30s., due to a few orders to sell from Paris, a good many of this company's shares being held in France. E stern Telegraph Ordinary stock has also come in, as may be inferred from a fall of 2½ in the price to 120. "China" shares, however, maintain their figure of 12, so that the anomaly between the prices of the two companies issues is redressed in this way, although Eastern Ordinary is still a little the cheaper of the two, because of the bonus which will no doubt be declared as usual, in company with the final dividend for the year. New York Telephone Bonds reacted to 96. Marconis are quiet at $1\frac{1}{16}$, and the subsidiaries are fairly well maintained.

For the purposes of our oustomary review, we will take the quotations as set forth in our weekly lists, these being representative of various markets connected with the electrical industry. The first place shall be given to the shares of the electricity supply companies:—

Our third list is concerned with the stocks and shares of countries outside the United Kingdom. Here, the chief loss is that sustained by the Brazilian and Mexican concerns. In regard to Mexico, chaos continues to reign; and to deal in the securities of the country is all but impossible:—

The best that can be said about the Home Railway market is that things are not so bad now as they were at one time, soon after war was declared. There are, however, substantial falls left, as these figures illustrate:—

				Now.	Jan. 2, 1914.	Fall.

Manufacturing shares alone survive the annual comparison with honour. Big jumps have taken place in some of the lower-priced issues. Edison & Swan partly-paid shares were virtually unsafeable at the beginning of the year: now they stand at 12s. Other movements are also worth noticing:—

Next Monday the Stock Exchange re-opens for dealing, after having been closed for a full five months. Such severe restrictions have been laid upon business by the Treasury that many members despair of being able to do any at all under the latest regulations. In all probability, the difficulties will adjust and compose themselves, as troubles have an occasional knack of doing. That they may, and by this operation conduce to the greater prosperity of every reader, is a New Year's offering to him as cordial as it is sincere.

Winnipeg Electric Railway Co.—A dividend at the rate of 3 per cent. for the quarter ending 31st ult., on the fully paid up capital stock is payable on January 2nd.

Victoria Falls and Transvaal Power Co., Ltd.—The directors, says the Financial Times, have declared a six months' dividend at the rate of 6 per cent. per annum, less income-tax, on the preference shares, bringing matters up to June 30th, 1913.

Waygood-Otis. Ltd.—The directors announce, says the *Financial Times*, that, in view of the disturbance caused by the war and the uncertainty as to future business, they do not think it advisable to consider the payment of an interim dividend,

HIGH-VOLTAGE DANGERS PRESENT IN STATIC TRANSFORMERS DUE TO ELECTROSTATIC CAPACITY OF THE WINDINGS.

By J. LIND: EY THOMPSON, M.So., A.M.I.H.E., and S. AUSTEN STIGANT.

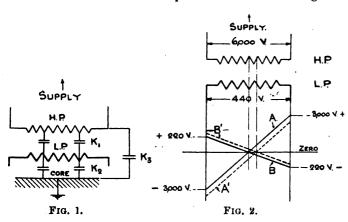

THE presence of high voltages on low-pressure windings of static transformers appears to the average engineer an improbability nuless a breakdown of insulation occurs from high-pressure to low-pressure windings, and then only when the low-pressure winding is unearthed. This article is intended, however, to impress on the lay mind that high pressures may be present due to other causes and against which precautions must be taken.

The danger referred to is the direct outcome of operating conditions in conjunction with the electrostatic capacities of

the windings to the core, and also to one another.

Single-Phase Transformers.—As is well known, in both core and shell type transformers the high-pressure and low-pressure coils are adjacent to one another and have considerable metal surfaces immediately facing each other, interspersed with a high dielectric. This condition of things immediately gives us a form of static conderser in which the high-pressure winding acts as one plate with the low pressure as the other, and since a dielectric of known specific inductive capacity is sandwiched in between, a high static pressure can exist between these two windings. Hence, since the low-pressure and the high-pressure windings again may be adjacent to the core, these windings have also a capacity to the core, and, as the usual practice is to permanently ground the core of all power transformers, therefore to ground. These conditions are shown diagrammatically in fig. 1, taking a transformer of 6,000/440-volt ratio. If $K_1 = \text{capacity}$ between high and low pressure windings, $K_2 = \text{capacity}$ between low pressure and core, $K_3 = \text{capacity}$ between high pressure and core, then $K_3 = K_1 (K_1 + K_2)$.

Under normal conditions, with unearthed high and lowpressure windings and with both terminals of the transformer winding connected to the line at the same instant, the resultant distribution of potential across the high-

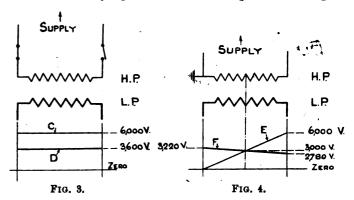

pressure windings is zero, and, therefore, also is that of the low pressure as shown in fig. 2, curves A and B. The zero point will be at the centre of the windings if these are symmetrical, but if otherwise distributed, it will move towards that end of the windings having the lesser impedance, as shown by the dotted curves A' and B', fig. 2. If, however, on switching the transformer winding on to a live line, one terminal of the high-pressure winding makes connection before the other, then during that interval existing between partial and complete connection of the transformer, the whole of the high-pressure winding will assume the full line potential above earth, as shown by curve c, fig. 3. Now, due to the capacity of high pressure to low and low pressure to earth (or core) the whole of the low-pressure winding assumes a definite high static potential above earth, the value of which will be $v = v_1 \times \kappa_1/(\kappa_1 + \kappa_2)$, where $v_1 =$ high-pressure supply voltage. So that if we

assume that K_1 and K_2 are in the ratio of 1.5 to 1, i.e., assuming that—

capacity of high pressure to low = $1.5 \times z$ microfarads , ,, low pressure to core = $1 \times z$,,

then
$$v = \frac{6.000 \times 1.5 z}{1.5 z + z} = \frac{6.000 \times 1.5}{2.5} = 3,600 \text{ volts},$$

this value being shown in fig. 3, curve D. Thus we see that the low-pressure winding has been given a potential above earth of 3,600 volts due to the electrostatic capacity of the windings, combined with uneven switching. This is, of course, abnormally high for a 440-volt low-pressure winding,

and so endangers the insulation that unless it is very liberally proportioned between the low pressure and core, a

serious breakdown may eventually occur.

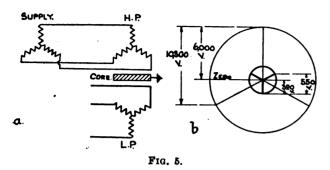

If the low-pressure winding happens to be connected to a motor or other apparatus, the pressure rise will depend on the resultant capacity of the circuit to ground, which will, of course, be lower or higher, as the case may be, but may still be of such a value as to allow abnormal potential to exist. The breakdown may occur due to this potential at any point of the low-pressure circuit, the whole of which is at the same abnormal static potential.

To take another case which is often met in connection with high-voltage transmission, systems and "testing" transformers, where one terminal of the high-pressure windings is earthed, as shown in fig. 4. As soon as the one high-pressure terminal is earthed, the other assumes full line potential above earth, and the voltage distribution is as shown in fig. 4, curve E, thus giving the mid-point of the high-pressure winding a potential of 6,000/2 = 3,000 volts above earth. Therefore, due to the capacity between high and low-pressure windings, the low-pressure mid-point now assumes a potential equal to the mean potential of the highpressure windings. Or, in other words, it is equal to the maximum high-pressure voltage to ground multiplied by the ratio of the capacity of low-pressure winding to ground and the sum of its capacity to high pressure and to ground. But since the high-pressure winding is earthed, the capacity of low pressure to high is the same as the capacity of low pressure to ground, hence this ratio is $1/(1+1) = \frac{1}{2}$, and therefore the static potential impressed on the lowpressure winding is equal to $6,000 \times \frac{1}{2} = 3,000$ volts. The low-pressure termina's will, therefore, rise to a potential of half the normal ratio voltage above and below this value, i.e., one end will be at 3,000 + 440/2 = 3,220 volts, and the other at 3,000 - 440/2 = 2,780 volts, as shown at fig. 4, curve F.

Three-Phase Transformers.—In studying the electrostatic stresses induced in the windings of three-phase transformers, we will take for an example a simple core type star/star connected transformer of ratio 10,300/550 line volts, or 6,000/320 phase volts. The electrostatic capacities of the windings to each other and to earth bring about high static potentials in a similar manner to that already described for single-phase transformers, that is, under two conditions of (a) earthed high-pressure supply and unearthed low-pressure transformer windings, and (b) uneven switching. Before studying these two important conditions, however, we will glance for a moment at two other cases, which, though not directly involving electrostatic stresses proper, will materially assist in elucidating subsequent problems.

Consider the system in the first case as being totally

unearthed, fig. 5a. If, as is assumed, the high and low-pressure phases are symmetrically balanced as regards their supply voltage, insulation resistance, capacity and distribution of windings, which usually prevail, then the neutral points of both high and low-pressure windings of the transformer will be at zero potential, as will also the core. As, therefore, the resultant potential of the transformer wind-

iags is zero, it follows that the electrostatic potential is also zero, and that the total voltage across the low-pressure windings is only that due to the winding ratio. These conditions are shown vectorially in fig. 5b.

As previously stated, if the specific inductive capacity and resistance of the phase insulation is symmetrical, then the above conditions apply equally to any combination of earthed neutral and core.

(To be continued.)

RECENT ADVANCES IN ELECTRICAL CRANE AND LIFT DESIGN.

[COMMUNICATED.]

(Concluded from page 867, Vol. 75.)

Some very interesting lift and crane controllers are built by Messrs. Laurence, Scott & Co., Ltd., two of which are illustrated in figs. 8 and 9. The former shows a reversing controller fitted with a single-pole overload and no-volt circuit-breaker, while the second shows a useful type of controller with a universal handle waich is suitable for operating two motions on a crane at the same time, as, for example, in lifting and slewing simultaneously. It will be seen that the up and down movements of the handle can be made to correspond to speeds, to raise or lower, while the horizontal movement can be made to correspond with the slewing or travelling motion in either direction. In these reversing drum controllers for series-wound motors a very effective spring drive is adopted with a flat convolute spring, which, combined with a star wheel and spring roller, gives a very quick "make and break" action at each stop. The renewable contact fingers have locked adjustments, and they are given ample space with thick spark guards of asbestos material moulded under pressure. The magnetic blow-outs are very powerful, and are correctly designed so that the lines of force are actually at right angles to the arc, while the insulation adopted is entirely of micanite in the form of troughs or micanite covered bar. The controllers can be fitted either with handle or hand-rope control, the latter being espicially useful for overhead cranes worked from below, and they are fitted with a fly-back arrangement whereby, owing to the action of a long convolute spring, a very even return action is obtained, which commences on the first contact in either direction, and returns the handle to the off position with certainty. Fig. 10 shows the standard connections for a reversing drum controller for series-wound motors, while the wiring diagram to the right of the illustration shows a modification which gives 30 to 60 per cent. extra torque, with half current, on every step but the last step, which requires that the motor should be specially wound.

In the reversing drum controllers for series-wound motors where rheostatic lowering is required, the control in lowering is obtained by making the motor generate on to the same

resistance which is used for starting, and fig. 11 shows a controller diagram for this purpose. On the first lowering step from the off position the brake is lifted, and the armature is so connected up that the series winding with the lowering direction of rotation generates on to part of the starting resistance, which is then connected across the terminals to the motor, the motor being entirely disconnected from the mains. On the next two steps more resistance is inserted, while on the fourth step the whole of the resistance is inserted. On the fifth step this resistance circuit is opened, so that the motor runs freely, while on the sixth step the

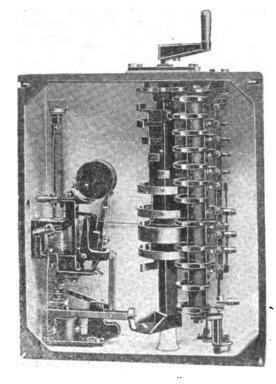

Fig. 8.

motor is connected up to the mains through the whole of the starting resistance, and on the seventh step some of this resistance is short-circuited. These steps are only required when the weight to be lowered is so light that it will not start the motor. If, however, the weight is started down on the sixth or seventh step, it will probably accelerate rapidly. If, then, the controller-handle is brought back on to the fifth step, the motor will be running quite freely. On the fourth

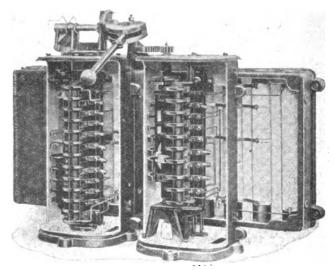

Fig. 9.

step, however, it will generate through the resistance, and the speed will be checked. Coming back on the third step, a smaller ohmic resistance is in series, and the speed will be very much reduced, as a smaller voltage will be required to generate a considerable current, while, on the first step, the speed can be brought down to a creep. It is interesting to note that the lowering speed on each step is

practically the same for all loads, while these lowering speeds can be readily adjusted within considerable limits after the controller is fixed, so that the best results can be obtained to suit actual running conditions. The great advantage of this type of controller is the very complete control that is given over the lowering speeds. One of these controllers, combined with the solenoid and centrifugal brake, makes a very fine combination for high-lifting cranes, as the centrifugal brake prevents the motor from damaging itself by running away, no matter how the controller is manipulated. The operator can lower at full speed on the last, or power, step, and can, by manipulation of the three rheostatic braking contacts, bring the heaviest load to rest gently and without shock. This controller is, of course, only applicable where efficient gearing is used, not being applicable

within measurable distance of the melting point of solder, and as solder is very often used in connection with wire resistances, it is therefore a convenient value to adopt as a specification figure. Where, however, solder is not used, and where the material employed does not oxidise very rapidly at a red heat when exposed to the atmosphere, it is easily seen that this figure may be exceeded with safety.

In addition to the necessity for good ventilation, it is also obvious that the resistance must stand up to continuous working from the point of view of mechanical st ength and electrical insulation, having in mind that in crane work it is very often the case that the operator knows very little about the electrical plant under his charge, and therefore it is not treated with the best consideration, and, moreover, cranes

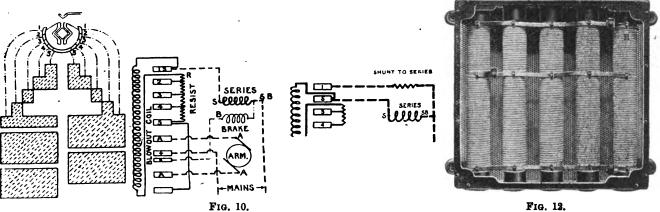

Fig. 12.

where the efficiency of the gearing is less than 50 per cent. Therefore it is not used in conjunction with an automatic lowering brake, the flapper brake, or a series-wound brake.

In connection with the design of apparatus for crane control, one of the most important features is the means taken to obtain an absolutely safe and reliable form of control resistance. It will readily be seen that the failure or shortcircuiting of such resistance during operation might easily involve a very serious accident, and it is therefore highly essential that every means should be taken to see that the risks due to this cause are minimised. A word or two may, therefore, be given concerning a type of resistance which has been developed as a result of continuous experiment and

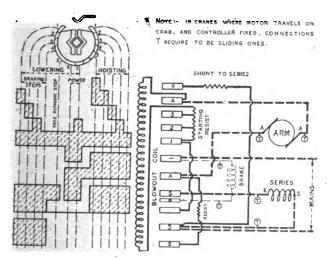

Fig. 11.

practical application by Messrs. Laurence, Sc tt & Co, Ltd., and which is shown in fig. 12. It may be pointed out that this resistance does not depend to any appreciable extent on the absorption of heat by the substance contained in the resistance, as was the case in the earlier forms of resistance manufactured. It is now pretty generally recognised that the safest and most enduring type of resist ince is that which depends on the heat-dispersion principle, that is to say, on bringing into active and organised contact with the material through which the current passes, a volume of air sufficient to carry off the heat as rapidly as it is generated, without allowing the temperature of the resistance to rise above, say, 200° F. This limit is suggested, inasmuch as it approaches

and their gear are often installed in very undesirable situations with regard to climatic conditions. It must also be capable on occasion of taking a good overload. resistance which is used in connection with such work is a cast-iron grid, but this has the defect that cast-iron is brittle and is liable to snap under the vibration which often The metal is, of course, cheap, accompanies crane work. and it can be made with a considerable amount of heat absorptive capacity, especially when the resistances can be fairly well spaced. Where, however, the resistances have to be placed one above the other in banks or tiers, the heat rising from the lowest bank will interfere with the capacity of those above it, especially if stress is laid in the design on dispersion capacity. Grids have also been made of stamped steel, and these are mechanically stronger than cast iron, but the strips require considerable support to avoid sagging when they are hot, and steel is notoriously liable to rust in damp atmospheres.

The resistance shown in the illustration consists of spirals of a suitable conductor wound upon cylindrical supports. These supports are made of metal tube covered with micanite insulation, over which a layer of soft asbestos is placed in ord r to keep the spirals in position. The metal tubes are mechanically fitted to the case, and are thus earthed, and it is found that the micanite acts as a thoroughly good and permanent insulator under these circumstances. Originally the tubes were mounted on porcelain insulators, but it was The arrangefound that this precaution was unnece sary. ment now adopted provides for thorough mechanical fixing, and at the same time for longitudinal expansion of the tubes under heat. Any tube can be removed without disturbing the others, and any connection can be made without interfering with the rest of the arrangement. No solder is used, and as the tubes promote a species of chimney draught, thorough cooling of the resistances is obtained, and it is evident that there are no concealed or hidden accumulations of heat. These tube resistances which have been developed under the most stringent conditions of practice are fixed either with the tubes vertical or with the unit made flat with the tubes horizontal, and when in the latter position it is found preferable to place the tubes so that their axes lie parallel with the direction of movement for travelling cranes and similar positions, so as to give a better draught through the tubes. Total enclosure reduces the rating of the resistance by about one-third, and if they have to be banked in tiers as much space as possible must be given between the banks in order to keep the heat dispersion factor as high as possible.

In concluding the above brief survey of modern methods of electrical crane control, it must be emphasised that no attempt has been made to cover the whole of the field of British practice, as this would be an almost impossible task, in view of the enormous amount of attention which has been paid in recent years to this important branch of electrical engineering. Enough has, however, been said to show that the work has been fully specialised, and that some important developments have taken place in recent times.

THE PROMOTION OF THE ELECTRICAL TRADE.

(Concluded from page 844, Vol. 75.)

Mr. H. M. SAYERS, speaking from a number of years' experience in Portugal, Spain and Brazil, furnished some useful information concerning work in the last-mentioned country, where he was engaged as engineer to a lighting and traction company. His company, he said, was not anxious to carry out installation work, but it had to do so to a certain extent. The greater part of the work was done by contractors representing German, North American and, to some degree, English manufacturers. The Americans and Germans were very successful in obtaining installation work and orders for some lish manufacturers. The Americans and Germans were very successful in obtaining installation work and orders for some large and small machinery and accessories, the principal reason being that their agents are resident personal representatives. Brazilians like to see and converse with the men to whom they give orders; to feel that they are friends upon whom they can rely and who are able to speak the language correctly and fluently. In purpling this statement, the agentless of the second statement and fluently. whom they can rely and who are able to speak the language correctly and fluently. In making this statement the speaker confirmed the views expressed recently in the columns of an er-gineering contemporary, and since confirmed by German advices from New York. No doubt had time permitted, Mr. Sayers would have been able to have informed the meeting that not only Brazilians, but also the Argentines and other races in South America attach great value to the social side of business, and never expect business to be discussed at the races in South America attach great value to the social side of business, and never expect business to be discussed at the first interview. He would, moreover, perhaps have been able to say that whilst this question, which is exceedingly important from the point of view of South Americans, is scarcely taken into consideration by the North Americans in endeavouring to do business with the South, the Germans had made a special study of accommodating themselves to the wishes and customs of the Southerners in this direction. Passing on from this digression, we learn from the speaker that the Brazilians prefer English correspondence to bad Portuguese, as they can prefer English correspondence to bad Portuguese, as they can get the former translated, whereas they laugh at the latter. The market there which requires personal resident representatives is good, and south of Rio electricity is being supplied both in large and appell toward in consequence of the abundant tatives is good, and south of Rio electricity is being supplied both in large and small towns in consequence of the abundant water power available. Most of the work in the large towns has been done by North Americans, and nearly all the supply is three-phase, the arrangements being according to American standards. The grant of extended credit as given by the Germans is not necessary. Certain American firms have done good business, and they are not in the habit of giving as long credit as the Germans, and to this may be added a New York statement, whether it be right or wrong, of the American practice being either cash or payment at the end of 30 days. It is, however, uncertain whether this solely applies to the North or whether it also includes transactions with the days. It is, however, uncertain whether this solely applies to the North or whether it also includes transactions with the South. Mr. Sayers made a good point when he explained that Brazilian Portuguese is somewhat of a dialect, and that catalogues and other literary matte, must be prepared in technical Brazilian-Portuguese. The catalogues should have a technical style to a much larger extent than in England and complete equipment, as, for instance, motor, switch-gear and starter, should be all placed together, so that intending purchasers may see what they have to pay without referring to three lists. Turning to the climatic conditions of the country, the speaker stated that a w. 1 range of temperature exists, and the only difficulty he had found in British apparatus was in respect to transformers. It was impossible for him to procure small (pole line) British transformers which were satisfactory, and they had, therefore, to be obtained from the United States. Most of the transformers have to bear the blazing heat of the sun on the one hand and heavy rainfall on the other. In some cases, the speaker concluded, British material is too heavy, but the people require wiring and fittings to suit their conditions.

Mr. Hartland Swan, who is associated with one of the notor-car manufacturing companies, remarked that if electrical engineers found it necessary to charge a higher price than German rivals and lost the business, there must be some reason. If the margin required by the former was higher than that of the latter it should be cut down so as to secure the business. One reason why foreigners obtained business was that they laid themselves out to convince purchasers that their goods were better, and therefore they got the orders.

If the British firms intended to make money they must produce goods at the right price and they must employ up-to-date methods, and the salesman must be able to convince and satisfy prospective customers that they have the best manufactures to offer them.

Mr. J. E. Kingsbury expressed the opinion that salesmanship was only one degree removed from statesmanship. It might be that electrical firms did not understand their busisimp was only one degree removed from statesmanship. It might be that electrical firms did not understand their business, but the trade had suffered from drawbacks in the eighties, to which Mr. Scholey had referred, although Germany and the United States had been free from such disadvantages. As to the special conditions which it was sought to have brought about, the speaker could see no real possibility of suggesting anything. English business men were as good as any, and the speaker had known many. It was possible that English financiers had got into a groove. In France and Germany there was a financial link, and it was possible that that was a link which they ought to interpose with advantage. The electrical business was not in a bad way, and individual enterprise might be as effective in that as in other branches. The speaker doubted whether there was a better example of faith or enterprise than the work of the English submarine cable pioneers, and all they needed now was the same faith in individual enterprise, leaving alone adventitious aids, and there would be no occasion for pessimism as to the future.

adventitious aids, and there would be no occasion for pessimism as to the future.

Mr. F. R. Jones detected in the observations of the last speaker the sentiment that what had been done in the past could be done again. The conditions, however, had changed. Germany had been erected during the past forty years. The difference was that to-day they had Germany on one side and the United States on the other—progressive nations, highly trained, and real competitors in the business-field. If that competition was to be coped with it must be met by something real, practical and tangible. If they had the basis to sell there was nothing to prevent their goods from gaining the respect to which they were entitled. If they were real salesmen they would only get the price equal to that which their competitors received for inferior goods, but they should satisfy customers that when they paid 25 per cent. more they secured a better service.

competitors received for inferior goods, but they should satisfy customers that when they paid 25 per cent. more they secured a better service.

Mr. E. J. Fox stated that so far as his knowledge of machinery was concerned the picture painted by Mr. Scholey was none too gloomy. The firm where he was employed found occupation for 15,000 workmen. The engineering trade sold through travellers and tradesmen. One of the principal points they had appreciated was that different types of salesmen were required for the different classes of material to be sold. The electrical industry was to a large extent outside of ordinary considerations of price. In the past manufacturers had had to compete with conditions in Germany which were entirely artificial. If a nation like Germany was able to and did grant heavy subsidies on the export of machinery, it stood to reason that that system was benefiting exports. Mr. Fox, who referred further to subsidies, is obviously mistaken. There are not Government subsidies on exports of machinery. The only Government subsidies, if they can be so called, have been very low railway rates for the transport of export manufactures in general to the coast, and very low combined rail and shipping rates to the Levant coast, and perhaps to certain other countries. The speaker evidently had in mind private export bounties granted by trade syndicates on coal and coke, pig-iron, semi-finished steel and joists used in the production of complete manufactures for the export markets. Leaving this particular point, Mr. Fox proceeded to remark that Germany was primarily a fighting nation and needed a large anny. It was cheaper for her to maintain a large army employed in industries, and the country subsidied those industries in return for maintaining a large reserve army to be ployed in industries, and the country subsidised those industries in return for maintaining a large reserve army to be called upon when required. The German industrial banks had a great deal to do with the export trade, and, indirectly, they a great deal 10 do with the export trade, and, indirectly, they had been responsible, in the speaker's opinion, for bringing together various small firms and resolving the industry into two or three large groups. But surely the facts are otherwise. Is it not more correct to say that the large firms have destroyed the competition of the smaller firms, except the special works; that this relian of communicant transmitten has not yet been the competition of the smaller firms, except the special works; that this policy of economic externination has not yet been brought to a close; and that the special works have been complaining for the past few years of the continued monopolistic tendencies of the large groups? As small firms cannot compete economically with large makers, Mr. Fox asked why the 30 firms should not combine into two or three groups. the 30 firms should not combine into two or three groups. It was, however, extremely difficult, and the vested interests were so divergent that it was almost impossible to bring them together. The speaker said they themselves were to blame to some extent, and would continue blameworthy if they did not realise that they must co-operate, and he entered a protest against German-owned companies being allowed to trade under the title of Endish companies. under the title of English companies

under the title of English companies.

Mr. McAlpin, who entertained the meeting with two or three events from his Colonial experience, said that he proceeded to one of the eastern colonies a few years ago to report on the development of lighting and power. Although nothing had been said of his intended visit, he had scarcely been in the colony a week before the managing director of one of the largest German companies came on the scene. Having arrived, he set to work and laid the foundation for the capture of business; he obtained it, and the bulk of the work went to Germany. Just before the speaker's arrival in the

colony a concession had been granted for the construction of railways throughout the State. No British firms sent out a representative, but two German manufacturers did so, and they secured the whole of the trade. In a second colony, the local authorities were induced to get quotations for machinery from England, and they eventually placed their order, which was for oil transformers, with a shipping house. The latter divided the order, local quotations being obtained for lubricating oil. In due course the transformers arrived and were put together, being nearly ruined, but were eventually found to be of insufficient margin to stand the blazing sun. The remainder of the orders of that description went to Germany. The third instance related to another Colony where are lamps were required for railway lighting purposes. It was found that, owing to crippling the position of the lamps in the lanterns, the light only spread over a space of about 16 ft. diameter. That would be a small matter in England, but it was simply fatal 7,000 miles from the base of supplies. Mr. Scholey had said they could not compete with the Germans in motors, but the speaker did not know the reason. Nevertheless, he had a case in point where a firm who made electrical cranes used to purchase the motors from an English firm, but the prices increased instead of decreasing. The colony a concession had been granted for the construction of firm, but the prices increased instead of decreasing. The crane makers then established a new branch and made their own motors, finding out at the end of twelve months that the cost was one-half of what they had been accustomed to pay as buyers.
Mr. T. C. Elder remarked that the electrical firms were

Mr. T. C. Elder remarked that the electrical firms were always selling to expert buyers—or to those who believed they were expert buyers. In many cases the purchaser drew up the specification and told the maker not only what he wanted, but also how it was to be made. When sales manager for a leading company several years ago, they had a first introduction to American methods. The case was that of tenders for the plant for a London borough council, to which his company had delivered similar plant three years previously. The price quoted in a contract for about a total of £3,000 was £5 higher than the lowest tender. The borough electrical engineer said he would be delighted to have the machines, but that it would be useless to put before the council anything other than the than the lowest tender. The borough electrical engineer said he would be delighted to have the machines, but that it would be useless to put before the council anything other than the lowest tender. The speaker went to see the chairman of the committee, whom he found in a public-house. The case was put before him, but the chairman said that they could do nothing but accept the lowest tender. If they did otherwise, the chairman declared, he would be accused of having been corrupted. Mr. Elder, whose office had been invaded by the advocates of American methods, who told him they could sell goods for him, put this borough council case before one of these experts. The latter did not know what remedy to suggest, but eventually said, "I think you might work the Press." The difficulty, however, the speaker stated, was that if the Press was worked in regard to one municipality, the firm would be black-listed throughout the country. His company did not receive the order. Turning to another question, the speaker observed that no attempt had been made in this country to arouse public enthusiasm in the spread of electricity. In the United States, however, the sum of £200,000 was subscribed some time ago by makers to "enthuse" the public, but British industry did nothing of the kind. The Institution of Electrical Engineers took no cognisance of business, and repeatedly refused to do so. The the kind. The Institution of Electrical Engineers took no cognisance of business, and repeatedly refused to do so. The great difficulty arose from financial weakness, but they had not the money, and the speaker did not see how they would get it without some form of Protection. The electrical industry was one of the best in Germany. When travellers left that country they had the financial power of German banks and the diplomatic support of the Government, but British travellers had nothing of the sort, and the result was foreseen.

The meeting concluded with a few observations made by the introducer of the subject discussed.

It may be well to explain that the German banks which finance electrical enterprise nominate their own representatives on the boards of directors of manufacturing and other com-

finance electrical enterprise nominate their own representatives on the boards of directors of manufacturing and other companies which they finance, and that the great financial strength which they possess confers upon the banks concerned much greater powers than are represented by the two or three directorships which they hold in each instance. In those cases where the banks take over a large block of shares or bonds (loans) there is, naturally, no intention of retaining them any longer than is necessary. If no market exists on the Berlin Bourse one is soon created after the Bourse Committee has sanctioned the introduction, and the Bourse representatives of the banks as a general rule soon dispose of the paper, leaving the banks in possession of their commissions and profits on the transactions. These observations apply both to single operations and to those of an underwriting character, so that any electrical company which is backed by a good institution has no difficulty in the flotation of fresh capital.

Patents and Alien Enemies.—Application for the avoidance or suspension of Letters Patent No. 5,198/98, granted to Miele, for metallic coating on metal articles, has been lodged by Mesers. W. T. Henley's Telegraph Works Co., L'd., and the date of hearing has been fixed for January 14th, 1915.

TRADE STATISTICS OF AUSTRALIA.

The following figures, showing the imports of electrical and allied goods into Australia during the year 1913, are taken from the recently-issued official trade statistics; the figures for 1912 have been given for purposes of comparison and notes of increases or decreases have been added. Attention has before been called to the footing which the United States has gained in the trade. Although amongst the figures now under review there are some noticeable declines in the United States' share, these are not important when considered in relation to the general decline.

ELECTRIC BELL SIGNALLING IN COLLIERIES.

By THOS. G. WATTS, B.Sc.

(Abstract of paper published in the PROCEEDINGS of the South Wales Institute of Engineers, Nov. 24th, 1914.)

MR. R. V. Wheeler, Chief Chemist to the Explosions-in-Mines Committee, in a series of experiments on the ignition of methane and air mixtures by electric bells, has proved that the inductance of the circuit is of prime importance in deter-

the inductance of the circuit is of prime importance in determining whether the flash produced on breaking the circuit can ignite an explosive mixture, and that the amperage of the current is of more importance than the voltage.*

Dr. Wheeler made the general conclusion that: "If the current flowing round the signalling circuit could be reduced below 0.30 amperes by introducing suitable non-inductive resistances, there would be little risk of ignition by break flashes below 25 volts pressure. The use of Leclanché cells, therefore, owing to their high internal resistance, should afford greater comparative safety than the use of dry batteries."

With a view, not so much of determining the scientific features of electric spark ignition of explosive gaseous mixtures, as to find some safe system of bell signalling for underground

as to find some safe system of bell signalling for underground use, experiments were commenced at the laboratory at the Great Western Colliery Co.'s Maritime Coke Works.

The investigations were directed to determining two points, viz.:—(1) The ignition of mixtures by the spark at the contact breaker of the bell. (2) The ignition by the spark at the circuit-closing contact, which may be at any point on the line. A set of experiments were made by which it was determined that the most explosive mixture of the coke-oven gas used that the most explosive mixture of the coke-oven gas used.

was 15.7 per cent. gas and 84.3 per cent. air. The gas was analysed and found to contain hydrogen, 45.50 per cent.; methane, 29.50 per cent.; nitrogen, 20.01 per cent.

Attention should be given to the large hydrogen and methants.

ane contents. All the further experiments were performed in a mixture of this quality.

Using similar methods with methane, experiments were made to determine the relative ease of ignition of explosive mixtures of oven gas and methane by the spark at the contact breaker of an ordinary unprotected colliery bell. It was found that as far as ignition by spark is concerned, coke-oven gas and air mixtures in explosive proportion are more easily ignited than methane and air mixtures; and, as a rider from this statement, that any system which proves to be safe in coke-oven gas and air mixtures is absolutely safe in methane-air mix-

Experiments were also made to determine the relative ease of ignition of explosive mixtures of oven gas and methane by of ignition of explosive mixtures of oven gas and methane by sparks at a point of closing the circuit on the line; colliery bell outside chamber, "knocking wires" inside, contact made by rubbing wire with right angle bend against fixed wire. These experiments point to the fact that there is a real danger in electric bell signalling underground if gas is present to an explosive extent at the point of making and breaking circuit, and that systems of signalling with unprotected bells and the ordinary method of circuit closing with a knife or other tool across galvanised wires are distinctly unsafe in parts of a mine where gas is liable to occur. parts of a mine where gas is liable to occur.

[•] These experiments were fully reported in the ELECTRICAL REVIEW of July 31st, 1914, p. 191.

Attempts were then made to find some system which was safe in oven gas and air mixtures, this being a criterion of absolute safety in methanc-air mixtures.

The first attention was directed to the bell. If by any means gaseous mixtures could be excluded from the contact-breaker of the bell by means of an absolutely flame-tight cover, perfect safety in this direction should be attained. A bell of this type has been made by the General Electric Company. The electromagnets, contact breaker, and hammer spring are enclosed in a cast-iron case fitted with a cover, which is screwed up to an india-rubber joint between face and face. The motion of the contact breaker is conveyed to the external hammer by means of an attachment passing through a case filled with vaseline, so that the only point where internal motion is conveyed to the exterior (which debars a tight joint) is through a clot of vaseline which is impervious to the passage of air or gaseous mixtures. Whether or not this vaseline clot, in the high temperatures sometimes found underground, would run out and so leave open a passage for gaseous mixtures to enter, remains to be investigated, and further experiments with this type of bell are still to be carried out. Between ten and twenty experiments, consisting of ringing this bell with from ten to fourteen Leclanché cells, failed to produce The first attention was directed to the bell. tween ten and twenty experiments, consisting of ringing this bell with from ten to fourteen Leclanché cells, failed to produce the explosion of a 15.7 per cent. gas (oven gas) and air mixture. The order of things was then reversed. "Knocking wires" of the type mentioned before were introduced into the circuit with the aforementioned bell and with four cells, and an immediate explosion occurred. With three other similar bells ignition was brought about at the "knocking wires" with two cells and three cells respectively.

Adopting the principle of the Ruhmkorff coil condenser—that is to say, connecting through a condenser the circuit containing

Adopting the principle of the Ruhmkorff coil condenser—that is to say, connecting through a condenser the circuit containing the "make and break" of the bell used in the first series of experiments, which ignited the mixture of oven gas and air when rung by four Leclanché cells—it was found that absolutely no ignition was brought about, even when the bell was rung with twelve Leclanché cells.

We have, therefore, in response to the first query "What bell is safe in explosive mixtures?" two remedies. One is, as stated above, a flame-tight bell; the second an ordinary bell fitted with a condensing system across the sparkgap. As to which is the better system, several points arise in distinct favour of the condenser-fitted bell.

1. No alteration in temperature has the remotest effect on

1. No alteration in temperature has the remotest effect on

the sparkless condition brought about by the condenser.

2. The reduction of the spark to zero means a longer life to the platinum contacts.

Any bell at present in use can be converted into a safe

bell by the mere introduction of a condenser into the spark-gap circuit, thus avoiding any outlay except in condensers.

4. No amount of "tampering" would alter the effectiveness of a condenser-fitted bell, whereas the removal of the outer casing of a gas-tight bell immediately destroys its effectiveness of a protected bell. ness as a protected bell.

casing of a gas-tight bell immediately destroys its effectiveness as a protected bell.

Attention was then paid to the lines of "knocking wires."
Three bells—one of the old type, two others of the closed
gas-tight type—were respectively connected up through a
variable battery of one to ten cells outside the chamber, and
the circuit-closing contact fitted inside the chamber. Galvanised
wire was fixed through one side of the chamber and rigid, the
other a piece of No. 8 S.W.G. galvanised wire passing through
the same side and bent at right angles inside the chamber, so
that by a half-turn it could make contact with the fixed and
rigid wire. The cells were put in circuit one after another,
and explosions took place even with only two cells in circuit.

The colliery bell (ordinary type) was then used with a condenser in the contact breaker as previously described, the only
alteration in result being that five cells were necessary to
produce an explosion at the knocking wires. Working on the
theory that as a condenser connected across the spark-gap
of the bell produces a safe-bell, the same effect should be produced by placing a condenser across the "knocking wires,"
the experiment was tried. Although with the same bell, ignition had occurred with two cells, no ignition, though repeated
time after time, could be brought about by the two galvanised
wires making contact with a condenser across them and ten
Leclanché cells in the circuit. Apparently, therefore, the
introduction of a condenser across the knocking wires had
some peculiar physical influence on the spark; and one can
only conclude it to be a matter of temperature.

Before this could be accepted as a safe arrangement, however, conditions had to be brought more into line with colliery
conditions, and so the method of making contact was altered

conditions had to be brought more into line with colliery conditions, and so the method of making contact was altered from the rubbing of two galvanised wires for making contact to that of a file making contact on galvanised wire. The variable battery was worked from one cell to two cells. Immediately on the introduction of the third cell an explosion occurred. The condensing system was increased from one microfarad by gradual increments to the principles of the condensity of of the The condensing system was increased from one microfarad by gradual increments to ten microfarads, but on each contact an explosion occurred on three or four cells being introduced into the circuit and the file being used for contact. The file was then removed and the contact made again with the galvanised wires, and no explosion occurred with even ten cells in the circuit. As a system of prevention, the condenser across the knocking wires is by these results proved to be useless. The only other outlet occurring to the mind of the experimenters was the introduction of relays. This system depends upon the completion of the bell circuit by the action of a relay worked by a separate circuit. If, therefore, one can

operate a relay by means of so small a current as to render the sparking at contact so mild that it will not ignite the gas-air mixture and also can reduce the sparking of the relay contact which closes the bell circuit to an inoperative condition as which closes the bell circuit to an inoperative condition as regards explosve mixture ignition, then, by the use of this system in conjunction with a bell fitted with a condenser, we have a safe system. The spark made by the relay in making contact for the bell circuit is entirely removed by putting a condenser across the two points of stud contact.

A system such as above suggested was then connected up. Each part was tried in turn. The bell, fitted with a condenser, was put in series with a variable battery and 10-ohm relay contact. The 10-ohm relay was for the time being operated by two cells and an ordinary bell push.

From one to ten cells were put into the bell circuit in turn and the bell rung by the relay. No explosion occurred, and the bell was therefore considered safe.

The relay itself was then placed in the chamber, and actuated by an external push to ring the bell (also external) with from one to ten cells in the bell circuit in turn.

Though a distinct spark was visible at the platinum contact

Though a distinct spark was visible at the platinum contact of the relay, no explosion occurred. A condenser was then put across the spark gap of the relay; the spark disappeared and no explosion occurred. Finally, the two "knocking wires" were arranged as before in the chamber (no file) so as to complete the relay circuit containing a variable battery of one to ten cells and the relay. In the bell circuit, which was external to the chamber, were the bell, relay contact, and five-cell battery

It was evident that with a relay the same danger of ignition arose as with the bell, for with three cells in the relay

circuit ignition occurred.

A saving clause arises, however, in that the 10-ohm relay could be operated from anywhere in a pit of normal size by

two cells only.

A relay was then obtained with ten times the resistance—namely, a standard gas-tight G.E.C. 100-ohm relay—and the above experiments repeated. No explosion took place until six cells were used.

The additional resistence, therefore, becomes a saving factor.

No 100-ohm relay requires more than two cells to operate it, as, averaging 13 ohms resistance to the mile of wire, the relay was found to be operative with two cells even when 100 ohms were placed as resistance in the relay circuit. We have thus a satisfactory and operative method for seven miles of wire.

miles of wire.

The relay is safe in a coke-oven gas-air mixture up to five cells, so that, allowing for all extraneous resistance, we have an absolutely safe margin for working even with four cells, as an oven gas-air mixture was only fired by six cells in the circuit, and a methane-air mixture would not be fired when the relay was operated by six cells.

The whole system, with the relay circuit containing four cells and closed by a file contact on the "knocking wires," the bell (condenser fitted), and five cells in the bell-circuit, and the relay itself were placed in the chamber in a 15.7 per cent oven-gas and air mixture. Although hundreds of contacts were made, no explosion occurred.

As there is no necessity to use more than three cells, there is a margin of three cells on the side of safety. To increase this margin, the investigation was taken a little further, using the suggestion that was made to the experimenters of introducing a method of limiting the inductance of the coils of the relay by introducing a shunt across the relay circuit. A resistance box, containing resistances of 3,000, 2,000, 1,000 ohms, was placed as a shunt across the relay circuit. On making contact with 2,000 ohms in the shunt there was an immediate diminution in the size and appearance of the spark at the contact of the "knocking wires" when using from one to ten cells to operate it.

With a shunt across the relay terminals, the relay is seferically as the contact with a cross the relay terminals, the relay is seferically as the relay

With a shunt across the relay terminals, the relay is safe with ten cells in circuit in an oven-gas mixture, and, therefore, with a much wider margin in methane-air mixtures. With the shunt of 2,000 ohms and ten cells in circuit, hundreds

with the shunt of 2,000 ohms and ten cells in circuit, hundreds of contacts were made and no explosion resulted.

The system described is safe even in oven-gas and air mixtures, and we can therefore recommend its use as an entirely safe system in the most gassy pits that can be selected.

The author tenders his thanks to the colliery electrician for the use of apparatus and for the suggestion of using a relay.

Colonial Trade.—The Imperial Advisory Council of the Institute of Industry and Commerce has been considering the best means of approaching the various Dominion Governments with a view to abolishing the payment of licence taxes payable by British commercial travellers in the Dominions and Colonies, and also for the purpose of considering the best means of bringing about the standardisation of Company Law throughout Great Britain, the Dominions and Colonies in order to facilitate commerce within the Empire. The Council decided that a memorandum should be drawn up by the Institute after consulting with the leading specialised trade organisations, and that this memorandum be submitted to the Agents General of the Dominions and Colonies for submission to their respective Governments.

OUR LEGAL QUERY COLUMN.

"ANXIOUS" writes:—"I should be glad if you could enlighten me, through the medium of your 'Legal Query' Column, on the following point. The company with which I am connected gives a supply of electricity under provisional orders. A prospective consumer male application to the company upon the usual form for a supply of electricity, and the service cables were laid in due course. A few weeks after, the owner of the property of which the consumer is a tenant gives the supply authority notice that, as his consent has not been obtained, the company must remove its supply cables from his premises, otherwise he will bring an action supply capies from his premises, otherwise he will oring an action against the company for trespass. I shall be glad to know, therefore, what are the owner's powers in regard to this matter. I may aid that I have been connected with supply undertakings, both municipal and otherwise, for the past 15 years, and this is the first case of the kind that I have come across, and I do not think it is usual for the supply authority to obtain the consent of the owner direct before made in the consent of the owner. direct before proceeding to lay cables to a consumer who may not be the owner of the property for which he makes application."

be the owner of the property for which he makes application.

"." The question raised is one which, curiously enough, is not discussed in books on the law relating to electric lighting, and it must be answered by reference to general principles. The action of trespass lies at the suit of the man in possession; hence the proper plaintiff is the person in actual or constructive possession at the time of the trespass. The owner cannot, therefore, sue the company for trespass in the present case. That, however, does not conclude the matter, for it has been laid down that where the trespass is not merely of a temporary nature, but is injurious to the reversion the owner or reversioner, although he cannot sue in the reversion, the owner or reversioner, although he cannot sue in trespass, may sue for the injury done to his interest. It has been held, for instance, that a reversioner may sue for structural injury to a house, cutting down trees, and placing the foundation of a wall in the plaintiff's land. It has not been decided whether the laying of mains amounts to such an injury that the reversioner may sue for it; but while "a reversioner cannot sue for a trifling trespass which produces no substantial injury," it is apprehended that the laying of mains would not be regarded as trifling.
"Anxious," however, may take comfort in this, that if he is sued by the owner he will probably have a right over against the tenant at whose instance he laid the mains. He should consult a solicitor.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

COMMONWEALTH OF AUSTRALIA.—The Board of Trade have received particulars of the import duties leviable on certain goods under the new Costoms Tariff which came into force in the Relow are labeled of Australia on December 3rd. Below are the test of the state of Australia on December 3rd. Common wealth of Australia on Docember 3rd. Below are given the new rates on electrical goods, both under the general tariff and also under the preferential tariff accorded to manufactures of the United Kingdom. These rates having been received by cable, are subject to confirmation by mail. For purposes of comparison the old rates levied on manufactures of the United Kingdom are

	Old rates on manufac- tures of the U.K.		rates. manufac- tures of the U.K.

TELEGRAPHY AND TELEPHONY IN 1914.

WHILE no startling discoveries or inventions in the field of electrical communication marked the past year, it was a period of steady progress and development. In January the International Conference on Safety of Life at Sea concluded its labours, and a Convention was signed, requiring the provision of wireless telegraph apparatus on all merchant ships that carried 50 or more persons on board; an Act was passed in August to give effect to this provision, which probably will be extended some day to all sea-going vessels.

The importance of wireless telegraphy in the service of the State was further recognised in the report in June of a Committee appointed towards the end of 1913, which recommended the establishment of a National Committee for Telegraphic Research, and of a special Research Laboratory under the control of the Committee, for the promotion of progress in telegraphy and telephony. Good progress was made with the first stations of the Imperial Wireless Chain, and the Marconi Co. completed ready for operation the powerful station at Carnarvon for trans-Atlantic communication, the corresponding station being erected in New Jersey, U.S.A. The State Service has not yet commenced work, but fortunately, as our Navy retained command of the seas, communication with all parts of the Empire has been maintained without interruption. What might have happened, however, in other circumstances was well exemplified by the destruction of the Pacific cable station at Fanning Island by a German cruiser in September, and the cutting of the cable to Jamaica on August 3rd, as well as the raid on the station at Cocos Island, which proved the undoing of the Emden; or by the interruption of the whole of the German deep-sea cables by our Navy.

A new four-wire telegraph cable was laid between this country and Germany, early in the year, and a four-core loaded telephone cable between Wales and Ireland—the longest cable of its kind in the world. A still longer one, however, is to be laid this year, between England and Holland—if circumstances permit of it.

The Post Office has made good progress in improving its methods with regard to both telegraphs and telephones; the Postmaster-General appointed a Special Committee to report on systems of high-speed telegraphy, and the Baudot system, which is being widely adopted in this country, was developed experimentally to sextuple-duplex between London and Birmingham, i.e., six separate channels in each direction on a single circuit. Quadruple-duplex Baudot is being installed between London, Liverpool and Glasgow, and the use of phantom telegraph circuits, superimposed upon the trunk telephone lines, has been greatly extended. The standard of maintenance of the overhead lines has also been raised, reducing the number of interruptions, and the underground telegraph system is approaching completion.

Digitized by GOOS PC

In July a Committee was appointed to inquire into the working of the telegraph service, with a view to improving its economy and efficiency.

The telephone service has also shown material improvement during the past year, largely due, no doubt, to the very elaborate system of recording, classifying and analysing the faults that occur in connection with the various exchanges which has been developed by the engineering staff. This system has the advantage that the condition and progress of each district can be continuously watched, and the staffs of the various exchanges are put in competition with one another to produce the most creditable showing. The outbreak of war imposed upon the London telephone department extraordinary demands for emergency connections to Government offices, hospitals, &c., which were handled with a celerity beyond all praise.

The direct connection between the Liverpool and Manchester exchanges by junction lines proved so satisfactory, that the Post Office has decided to apply the principle in other cases where important towns are at no great distance from one another. Three automatic telephone exchanges are being equipped, and eight others are in prospect. The telegraph and telephone services are working hand in hand; in many cases it has been possible to extend them jointly to places where either service alone would have proved too costly, and the transmission of telegrams by telephone is increasing.

As regards municipal telephony, the Portsmouth Corporation agreed to sell its undertaking to the Government, whilst, on the other hand, the latter sold the plant of the National Telephone Co. in Hull to the City Council, which is now the only municipality controlling its own telephone service within the United Kingdom.

The introduction of an entirely new system of automatic telephony, employing only relays, was a notable event, which will bear fruit at no distant date; and the successful experiments with wireless telegraphy and telephony to trains in motion in the United States may prove the key to the prevention of railway accidents in the future.

In October the opening of the American Marconi Co.'s wireless service between San Francisco and Honolulu was announced.

Revised tariffs for week-end letter telegrams to the Dominions were introduced during the year, with the co-operation of the cable companies.

The outbreak of war in August, of course, affected the telegraph and telephone services severely; all channels of communication with enemy countries were at once closed, and the telephone services between this country and the Continent were cut off. All telegrams became subject to censorship, and the prohibition of the use of codes for communication with the Dominions bore very heavily upon our industries. The restriction was eventually relaxed, but the limitations still imposed upon the use of codes greatly increase the cost of cable messages.

The Postmaster-General forbade not only the use of all private wireless stations in this country, but even the possession of wireless apparatus of any kind, and numerous prosecutions followed. It is a curious circumstance, however, that the only means of direct communication with Germany that we retain in full working order is the wireless telegraph, and the German Government uses the great station at Nauen for the distribution of more or less true news regarding the war and other matters broadcast over of land and the surface water. There can be little doubt that, in addition to the German wireless stations that were captured or destroyed by our forces, the enemy's cruisers were well served by secret stations, and possibly by others on neutral territory, so long as they were able to keep the sea. Of the immense value of wireless telegraphy to the British Navy during the war there can be no question; and it is interesting to note that this is the first great naval war in which it has been possible to put it to the test.

The wreck of the cable ship *Buccaneer* in the Indian Ocean was a regrettable incident of the year, fortunately of a kind that we rarely have to record.

The value of wireless telegraphy in saving life was once more exemplified, in connection with the loss of the *Empress of Ireland*. Progress towards the solution of the problem of wireless telephony on a commercial basis was reported, but was apparently interrupted by the war.

Electrical Progress at Manchester. To anyone who has watched it year by year, the development of electricity supply in its various phases provides a fascinating study. Though the actual generation of

electricity may be attractive only to the engineer, its successful production and distribution on the grand scale of the future will involve widespread interests, of which one is apt to lose sight in a casual survey of the situation.

To say that the supply of electricity is nowadays rapidly becoming a governing factor in social economics in certain—particularly industrial—areas, is not overstating the case, although it is not commonly realised how very closely interlinked the coal pile at the electricity works and the welfare and happiness of the surrounding population in such areas are becoming, nor how manfully the electrical engineer of the past and central station manager of the present have struggled to render this state of things possible. Cramped ideas of electricity supply, begotten of village pump traditions, are gradually fading away with the realisation of the greater things in store in the future, of which the various large schemes in hand at the present time in Europe, America, South Africa, and Australia afford some indication.

Of such projects, that of the Manchester Corporation to build a 160,000-kw. generating station at Barton, just outside the city boundary, is the most ambitious at the moment in this country, and is interesting because it indicates a degree of confidence in the big generating unit, of which our central station engineers have, to some extent, fought shy in the past.

Through the courtesy of Mr. S. L. Pearce, chief engineer of the Manchester electricity department, we are able to publish elsewhere in this issue some particulars and drawings of the proposed Barton station, the outstanding features of which will be the arrangements for receiving and storing fuel, the use of semi-purified sewage for condensing purposes and the adoption of the largest size of turbine-driven machinery, while the proposed 33,000-volt underground transmission between the Barton station and the centre of the city is also a distinctive feature of the complete scheme. To those who have studied the problem, it is evident that while successive advances in the design of turbo-electric plant have removed many of the practical difficulties in the way of concentrating large electrical powers, the boiler house and its attendant coal pile have shown no corresponding progress. Even in the favoured position of the Barton plant, only some four miles from a coalfield, with which it will be connected by both canal and railway, the delivery, reception, storage, and utilisation of, say, half a million tons of coal a year at one station, is an engineering problem in itself, involving greater difficulty than the adequate supply of condensing water, and suggestive of a probable limiting factor in future large generating plants.

It will be noted that at Barton the silo system of coal storage is to be adopted, this being an unusual feature in generating station design in this country, where fuel is generally stacked in the open for storage. Each of the boiler units will be equipped with the Prat induced draught system, and the array of 48 bell-monthed chimneys will constitute something of a record, even in the Manchester district.

The first section of the plant will comprise two 15,000-kw. turbine sets, and the plans of the complete plant include four such sets, together with four 25,000-kw. sets. Manchester already uses one 15,000-kw. turbine unit, and when

the new station reaches the stage where larger plant is required, even the 25,000-kw. turbine will have had sufficient time to demonstrate its usefulness.

Electricity supply is ever expanding, and all past experience has shown the futility of nibbling at the supply problems which will require to be faced in the near future, for which reason Mr. Pearce's scheme is a welcome departure, and it is fully justified by the wider American experience, which, after all, will be our own in a few years' time.

American central station authorities have a confident way of anticipating the future—and we are not aware that their unbounded enthusiasm in matters electrical has met with any disappointments—while by comparison we usually adopt hand-to-mouth methods, having no proper relation to prospective business, no primâ facis engineering basis, and which can only be explained by the timidity of those who control municipal exchequers and have not only to safeguard rates, but also to answer for their deeds to the guardian angels of the Local Government Board.

We believe that not only is this policy based on a mistaken conception of things, but that the Barton scheme will provide a much needed object lesson to those electricity authorities, municipal and private, in this country who have failed to appreciate the future of electricity supply at

its true worth.

War Risk and workmen's Compensation.

THE question whether a workman who is killed directly, or indirectly, through the action of an alien enemy is the victim of an accident arising out of,

and in the course of, his employment, has already arisen. It is a question of some interest, and it is important to those concerned with the supply of electricity, inasmuch as, according to common belief, generating stations are to be objects of attack from the Germans within our gates as soon as the Germans outside have effected a landing. falling through the roof of a station might give the man at the switchboard what Mark Twain would have described as "a considerable of a jolt in the back!" The facts in the only case hitherto decided are somewhat far removed from these; but the decision is, nevertheless, interesting on general grounds. It appears that a Grimsby trawler, which had taken due note of an Admiralty warning about floating mines, discovered some of these dangerous objects in the North Sea. Having put down a buoy to mark them, the skipper was making off to warn a warship, when his vessel collided with another mine and was blown up. The engineer, having been seriously injured, prosecuted a claim for an injury alleged to have arisen by accident arising out of, and in the course of, his employment. It was contended on behalf of the respondents—the owners of the trawler—that inasmuch as the skipper had gone out of his way to warn the warship, the accident did not arise in the course of the The employers had judgment, the learned County Court Judge saying: "My decision is based upon the broad principle that an injury caused by the act of an alien enemy is not an accident arising out of, and in the course of, the employment of a workman.

With all respect to the learned Judge, we think he stated the principle rather too broadly. Indeed, the fact that the County Court decision has been reversed on appeal fully justifies this view. Suppose the trawler had been on her "lawful occasions," and had then been blown up by a mine, so far as the engineer was concerned he would have been the victim of an accident just as much as if he had suffered from a peril of the deep. Applying this principle, the victim of a bomb thrown from a hostile airship on to a generating station would clearly have suffered an accident "in the course of his employment." The further question is: Did it arise "out of" the employment? This appears to depend on whether there was special exposure. We know of two cases in which special exposure has enabled a workman to recover. In one of these (Challis v. L. & S.W. Rly. Co.) an engine driver was injured by a stone thrown by a boy from a bridge under which his train

ran. It was shown to be a common practice for boys so to throw stones. The accident was held to have arisen out of the employment. In another case (Nisbet v. Rayne & Burn) a cashier carrying money in a railway for the payment of colliery wages was murdered. It was held that there was special exposure to risk of attack, and that the accident arose out of the employment. As it is the duty of an engineer to be at a post of danger, it seems to us that the station engineer injured at his post by a bomb from an airship, or a shell from an anti-airship gun, might well be able to make a claim for compensation.

THE old year having come to an end Rubber. one can take a dispassionate glance back over the twelvemonth, which has been a period of exceptional anxiety for all. Production has inevitably suffered from the world upheaval promoted by the Huns, and the result is that whereas it had been thought that 1914 might and probably would see a large increase in the rubber output of the world, so far as has been revealed at present, output was about stationary. It is calculated by Messrs. Gow, Wilson & Stanton that the production during 1914 totalled 107,000 tons, which is approximately the same amount as in the previous year, but there has been a distinct falling off in the yield of wild rubber areas, and a considerable gain therefore in the output from the plantations. It is estimated that last year's total of plantation rubber was 65,000 tons, compared with no more than 46,000 tons in 1913, and the growing importance in a relative and also in an actual degree of the plantation crops is thus unmistakeable. There do not appear to have been any great or appreciable strides made in the development of synthetic rubber, from which so much has been feared at one time and another, but there will be continual research work and more or less costly experiments no doubt. Price is, however, against synthetic rubber. It needs extravagant rates to justify and encourage experimental work on a large scale, and these prices are not now to be had for genuine rubber let alone for imitations.

There is no reliable information to be had in respect to the real statistical position, which is a good deal overclouded, partly in consequence of the embargo on exports. Considerable quantities of rubber are stored in public warehouses in both London and Liverpool, but a portion of this is merely held there awaiting export permits, so that it would be unwise to treat the warehouse returns as representing the real position of the commodity. There is very little to talk about in connection with the trade demand. Naturally things have been very quiet over the holidays, while prices are much about as they have been of late, and stand not far off the lowest points of last year. During 1913 standard crepe at one time touched 3s., but sold down to 1s. 11½d., which was also the lowest figure in 1913, while prices are close upon this now. The poorness of the market lately has been caused entirely by the financial and commer-

cial difficulties brought about by the war.

The news from the United States is not very cheering. Nevertheless there has been an improvement during the last few weeks, and the most has been made of the resumption of operations at the Hartford Rubber Co.'s plants at Hart-Both of these had been idle for ford and Providence. several months, partly because there had been a number of scares threatening the supply of crude material. those circumstances the management decided to close down the works, and use up the reserves of tires and other finished The stocks in this direction have now been greatly reduced, and the resumption of work is the natural result of the improved position in this respect. The American tire plants have booked a number of large orders for solid tires for the armies of the Allied nations in Europe, and the tire plants of the United States are now rapidly getting to work at full capacity.

The latest details to hand show that the exports of plantation rubber from the Straits Settlements (not including the Federated Malay States) for the 11 months—January to November—of last year totalled 17,393 tons, against

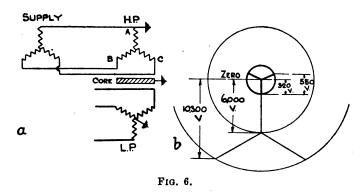

10,672 tons in 1913, and 5,242 tons in 1912.

HIGH-VOLTAGE DANGERS PRESENT IN STATIC TRANSFORMERS DUE TO ELECTROSTATIC CAPACITY OF THE WINDINGS.

By J. LINDLEY THOMPSON, M.Sc., A.M.I.E.E., and S. AUSTEN STIGANT.

(Concluded from page 26.)

Now take the case of a transformer earthed at any high-pressure phase point and with core and low-pressure neutral earthed as shown at fig. 6a. With simply the above conditions, but the high-pressure windings completely unearthed, the potential diagram would be as shown at fig. 5b, but

immediately any point of the high-pressure winding becomes earthed, that point drops to zero potential and a corresponding rise of potential takes place at the other terminals, as shown at fig. 6b. As will be seen then in this case with earthed high-pressure winding at A, the terminals B and C are (at a certain definite instant) at a potential of 10,300, or full line volts below earth with the neutral point at 6,000 volts below earth, where previously (at the same instant) the high-pressure terminals B and C were only at 6,000 volts $(10,300/\sqrt{3})$ below earth and the neutral point was at zero potential. It should be particularly noted here that no rise of potential can possibly occur on the low-pressure winding due to electrostatic conditions when the low-pressure neutral is earthed.

Taking now the cases before mentioned (a) and (b), fig. 7 shows diagrammatically a three-phase star/star transformer with earthed neutral supply and unearthed high and low-pressure transformer windings. The average potential of each high-pressure phase winding will equal line voltage \div $2 \times \sqrt{3}$, assuming even distribution of windings. Then since the capacities of high-pressure winding to low and low to core are equal, as the high-pressure supply neutral is earthed, the low-pressure winding being open-circuited will assume a static potential to earth equal to the high-pressure average phase voltage. This value, as with single-phase

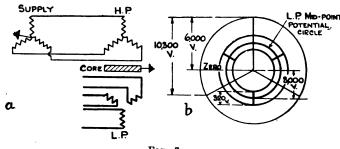

Fig. 7.

transformers, will be much in excess of its normal working pressure, and will present the same danger as in the cases previously cited, though, at the same time, probably being much lower than in the instance of uneven switching.

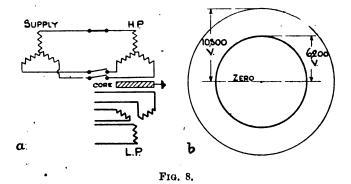

Turning now to the case of uneven switching, if one pole of the three-phase high-pressure supply be connected to the transformer winding, then the whole of the high-pressure winding assumes a potential above earth equal to the full

line voltage. Supposing also, in this example, that the low-pressure windings are all disconnected from each other, as would be the case for instance in a transformer for supplying a six-phase rotary, then the low-pressure windings would assume a potential above earth equal to—

$$v = v_1 \times \kappa_1/(\kappa_1 + \kappa_2),$$

where $v_1 = \text{full high-pressure line voltage}$. This potential would, in most cases, be of a very high value, and would most probably puncture the low-pressure insulation to core, assuming that the core is earthed. And as with single-phase transformers, although this puncture would not necessarily at the time produce disastrous results, the presence of this defect in the insulation would soon become apparent under normal working conditions, by presenting an earth at an unintended point, and thus bringing other parts of the low-pressure windings to definite voltages above earth, which voltages may be dangerous to human life. Fig. 8 a and b diagrammatically represent these conditions due to uneven switching.

Before passing on to other conditions of operation, it will be profitable to study a little further the danger to human life and apparatus, which will be present, due to a failure of insulation between high and low-pressure windings occasioned by electrostatic pressure as described in fig. 8. Suppose the high-pressure supply has its neutral earthed. Then upon completion of the switching operation, the fault above-mentioned having occurred, the low-pressure windings at this point of the breakdown, and therefore throughout, will assume a potential to earth equal to that existing between the high-pressure fault and earthed neutral. The value of this potential will depend on the exact position of the breakdown on the high-pressure windings, and this it will be readily seen will be excessive compared with the normal low-pressure voltage. Since the insulation of the low-pressure winding is generally very substantial for mechanical reasons, a breakdown of the low-pressure winding

to earth will not necessarily occur. With these conditions existing and the low-pressure winding switched on to its load mains, all apparatus on these mains is subjected to this high-pressure voltage. Here lies the grave danger to human life and apparatus, which follows as a consequence from the original static breakdown as fully explained above. As an example of this danger, it will be worth while to quote a disastrous breakdown which occurred to a large electric rolling mill plant with which the authors were

acquainted.

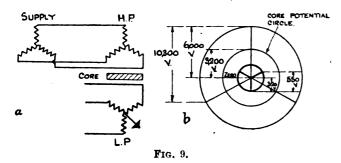

The plant consisted of a large 3/6-phase transformer supplying a rotary converter, which, in turn, supplied the large D.C. low-speed rolling mill motor. A fairly large induction motor for barring gear purposes was also supplied from the low-pressure side of the transformer. The transformer was supplied from a high-voltage three-phase main with an earthed neutral. The low-pressure windings of the transformer were unearthed. Due to some inexplicable cause, the high-pressure windings broke down to the low-pressure windings, and these for a time maintained their insulation The low-pressure windings of the transformer to earth. being connected in the usual way to the rotary, passed on the high pressure which they assumed from contact with the high-pressure windings, and so all the load circuit became subjected to this high pressure, with the result that breakdowns to earth occurred in the stator windings of the induction motor and at one point of the field windings of the large D.C. motor.

This breakdown to earth completed a circuit which was virtually a short-circuit across the breakdown point of the high-pressure windings and the earthed neutral, with the result that a heavy current flowed round this circuit, causing extensive damage.

The failure beyond that of the transformer, it will be seen, was due to the neglect of earthing the low-pressure side of the main transformer in an effective manner. Fortunately, no human element came into contact with live parts during the breakdown, but, nevertheless, danger existed and

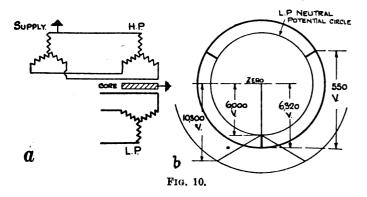

also expensive repairs were entailed.

In all the cases previously mentioned, the diagrams have been taken on the basis of the transformer core being earthed, which procedure should be followed in all cases as before mentioned. If for some reason or other the core is unearthed, a further electrostatic potential will exist between the core and earth, and since the core is usually connected to, and earthed from, the transformer tank, then the tank will also assume this same static potential. The danger due

to this possibility will be readily appreciated. With regard to this point, it will be interesting to cite a case which came under the authors' notice, in which a 500-K.V.A. transformer having a voltage ratio of 6,500/440 volts and connected star/delta was supplied with highpressure voltage in a non-symmetrical distribution. found on measuring with a static voltmeter that the core of the transformer had assumed a potential above earth of 3,500 volts. Commensurate then with this value we can take the core in our particular case to be at a potential of 3,200 volts above earth, for due to greatly verying external factors, it is practically impossible to calculate the capacity of core to earth. Fig. 9 a and b illustrates the condition of affairs, and, as will be seen, with the low-pressure neutral earthed that winding remains unaffected by electrostatic potentials. Similar static potentials would result with two-phase transformers with the mid-wire earthed and the secondary winding open-circuited, or, again, with one of the outer wires earthed and the secondary winding open-circuited or connected for three-wire opera-

For a final example, let us take the case of an accidental breakdown to earth of one phase of an unearthed high-

pressure three-phase system supplying a step-down transformer operating with unearthed high and low-pressure windings, as shown in fig. 10 a. Assuming that the earth fault occurs in one of the high-pressure supply cables, then that end of the transformer phase winding which is connected up to the supply system by the faulty cable in question immediately falls to zero potential, and the other two high-pressure terminals assume the full line potential of

10,300 volts, the neutral being at 6,000 volts below earth. Then, as the average potential of the high-pressure winding is that of the neutral, the low-pressure neutral will, due to the earth connection on the supply cable, assume this average potential of 6,000 volts, while the low-pressure terminals will be at a potential of the normal ratio volts above this value, viz., 6.320 volts, as shown in fig. 10 b.

From the several foregoing examples it will be an easy matter to ascertain the precise electrostatic conditions engendered in any particular system, the same fundamentals applying for delta and other connections as above enume-

rated for star.

In conclusion, the authors would point out that to safeguard against this accumulation of excessively high electrostatic potentials on the low-pressure windings, and consequent danger to insulation, it is necessary either to (1) solidly earth the low-pressure mid-point or one of the low-pressure terminals, or (2) earth through a multiple spark-gap or static earthing device. The advantage, chiefly on account of human safety, apart from the reduction of stresses in the insulation, lies, in the authors' device, since this opinion, with the static earthing apparatus only causes an earth when the static potentials exist and not during normal operations. The danger to the human element if it should accidentally come into contact with the low-pressure winding is much less than if a solid earth were existent, causing a definite voltage always to be maintained above earth, particularly if the earthed point was one terminal of the low-pressure

Regarding the diagrams, it will be seen that the vectors and curves representing the low-pressure potentials are necessarily drawn to a larger scale than those representing the high pressure, as the ratios above taken are too small to conveniently allow of the use of the same volts per inch

AUTOMATIC PROTECTIVE SWITCHGEAR AUTOMATIC CURRENT SYSTEMS.

By E. B. WEDMORE, M.I.E.E.

(Abstract of paper read before The Institution of Electrical Engineers, Dec. 10th, 1914).

The use of protective devices acting selectively to cut out faulty sections will not only ensure continuity of supply, but by

enabling faults to be cleared quickly and whilst only a small current is flowing, will greatly reduce their destructive effects.

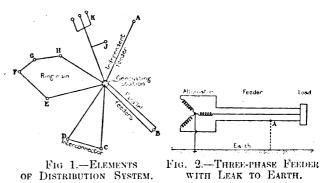

On plants rated at more than 20,000 kw. the systematic employment of selective devices throughout is commercially almost a necessity. On much smaller plants it is not sufficiently recognized that the use of selective protective devices often enables economies in the expenditure on cables to be often enables economies in the expenditure on cables to be effected, which alone will more than cover the expenditure on

the apparatus.

If the selective apparatus employed is of a type independent of the arrangement of the cables the distribution network can be laid out on the most economical principles, unhampered by the limitations of reverse-current relays and similar ap-

paratus.

Fig. 1 shows the elements of which distribution systems are constructed, and will serve to define the terms employed.

The supply to the point A is through an independent feeder. The supply to B is duplicated by the use of parallel feeders, whilst that to C and D is duplicated by the use of an interconnector. The ring main, feeding points E, F, G, and H,

is a combination of feeders and interconnectors. At each distribution point the circuits supplying individual motors, etc., are independent feeders.

All distribution systems are built up of combinations of the above. Independent feeders may be branched as at J

PROTECTION OF INDEPENDENT FEEDERS.

In the case of independent feeders it is impossible to remove the fault without causing a temporary loss of supply to that part fed by the faulty feeder; but trouble should be confined to the part in question. Fuses are satisfactory for small circuits, but are replaced by automatic circuit-breakers on large circuits. In order to prevent loss of supply it is necessary to adjust the overload devices to withstand perhaps several times normal load. Such an arrangement necessitates all faults being retained on the circuit until they become heavy faults, and it may allow of serious injury to the plant on a sustained overload. This difficulty is partly met by the use of time-limit overload devices.

A leak may occur between poles or to earth. A leak between poles generally develops into a short-circuit, and the case is met by the use of overload devices.

A leak to earth may not cause overloading; and thus may continue for a long time on a circuit protected only by over-In the case of independent feeders it is impossible to remove

A leak to earth may not cause overloading; and thus may continue for a long time on a circuit protected only by overload devices. This introduces a risk of fire or shock, serious in mining work and undesirable in all cases. In case the the leak is through combustible insulating materials, as in machines or cables, it will probably develop into a short-circuit between phases. On large distributing systems it is becoming increasingly important to provide means for disconnecting, before the short-circuit stage is reached, sections on which there are leakages.

Fig. 2 represents an independent 3-phase feeder having a leak to earth at the point A. It will be observed that prior to the leak all current going out through one of the conductors must return through the others, and that the sum of these currents must be zero. When a leak occurs, however, some of the current returns through the earth and the balance of the currents in the three conductors is no longer zero. This principle has been known for many years, and it is remarkable

principle has been known for many years, and it is remarkable that it has only recently been applied in the design of auto-

matic switchgear.

The principle finds its embodiment in protective switchgear of the core-balancing type, so called because the currents in the several cores in one cable are balanced. In one form a current transformer is furnished with a core surrounding the

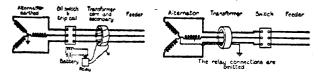

FIG. 3.—FEEDER PROTECTED BY FIG. 4.—SOURCE OF SUPPLY CORE-BALANCING TRANSFORMER. PROTECTED BY CORE-BALANCING.

feeder conductors as in fig. 3, which conductors form the primary winding. The secondary is connected directly through a relay to the circuit-breaker. Such devices are obtainable adjustable to operate on a leak of a few amperes.

In another form separate transformers are furnished, one in each conductor, and the tripping device is connected in a common return circuit. With this arrangement direct-acting trip coils can commonly be employed, operating at about one-third normal load, and the same transformers may be employed to excite instruments and to operate the usual be employed to excite instruments and to operate the usual time-limit overload devices which are still necessary to pro-tect the system against faults between phases and heavy overloading.

A sensitive leakage device is of great value and should be used universally on independent e.h.t. feeders, and on high-tension service where current transformers are available. The arrangement not only ensures the early disconnection of faulty circuits, but enables the fault to be removed from the system

with a minimum of disturbance

on 3-phase systems having the mid-noint earthed through a current-limiting resistance the core-balancing system allows the use of a resistance of high ohmic value, positively limiting the fault current to earth to a relatively small figure. Where halancing devices are not employed, the earthing resistance must allow a sufficiently large current to pass to operate the excellent devices with the highest current settings which the overload devices with the highest current settings which

the overload devices with the highest current settings which may be employed on the system.

The introduction of core-balancing apparatus enables selective action to be obtained to an extent quite impossible with overload devices.

The settings of the automatic devices in series between the generators and the local supply circuits can be graded in large steps of current and time without sacrificing the requirements at either end.

The difference in time setting between two consecutive switches must be sufficient to admit of one switch completely disconnecting the circuit before the other commences to operate. The total will generally lie between 4 second and 1 second according to the design. To this must be added a margin for safety. margin for safety.

All 3-phase systems have mid-point earthed through the star-connected condensers formed by the capacity of the cable, and on a fault to earth a corresponding capacity current will flow which may be quite sufficient to operate core-balancing

apparatus.

If an earthing resistance is used, as is generally the case on e.h.t. systems, the resistance should not pass less than 50 amperes or 100 amperes on high-tension and medium-tension systems. In practice the current required is generally higher than this on account of the higher settings of the automatic releases in large generator switches.

It has been shown that the use of leakage devices on feeder circuits has many advantages, and it remains to say that when core-balancing apparatus is applicable it will always give better

core-balancing apparatus is applicable it will always give better results than overload devices.

LEAKAGE PROTECTION FOR SOURCES OF SUPPLY.

The core-balancing principle has been applied recently to independent feeders conveying current from sources of supply If the conductor from the generator's neutral point to earth is included in the core-balancing transformer as in fig. 4 it will be found that the transformer is now unaffected by a feeder fault, but is affected by a fault in the machine or on the machine side of the transformer. Thus core-balancing apparatus will cut out an individual faulty load circuit or

This arrangement can be applied to any source having This arrangement can be applied to any source having one point earthed, for example a transformer, or a 3-phase machine with one pole earthed. It gives a very simple solution in the case of Scott-connected transformers feeding a 3-phase 4-wire system, but it is not a general solution of the problem of completely protecting sources of suply, as it is operative only on faults to earth. It gives complete protection only if the design of the apparatus protected is such that a breakdown must involve an earth fault and cannot occur simultaneously on all the phases simultaneously on all the phases.

PROTECTION OF PARALLEL FEEDERS.

The familiar and primitive solution of this problem lies in the use of time-limit overload devices at the end nearest the generating station, and reverse-current devices at the remote end of each feeder. When a fault occurs near the remote end of one feeder the current may be slarred nearly equally between them. The current may be starred nearly equally between them. The current flowing back into the fault from the common point at the remote end will actuate the reverse relay on the faulty feeder and thus relieve the sound feeder. The time-limit overload devices prevent the disconnection of the feeders until the reverse-current device has separated them at the remote end, thus concentrating the fault on the faulty

In addition to the disadvantages attaches to the use of overload devices, this combination possesses several others inherent in the use of simple reverse-current relays that depend for

their discriminating action on the use of potential windings.

Several attempts have been made to get over these difficulties, and although not one of them presents a general solution of the problem they are worthy of further consideration.

Perhaps the most-important device is that which has been

described as interlocking and is based on the principle that

parallel feeders of the same length, make, and cross-section will normally share the current equally.

The essential feature of the interlock is the establishment of a relationship between the apparatus and the circuits such that the apparatus cannot operate to cut out the circuits unless the balance of current between the circuits is destroyed.

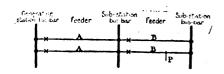

Fig. 5.—Sub-station Fed through Parallel Feeders.

Fig. 5 shows two sub-stations fed in series through pairs of parrallel feeders A, A, and B, B, from a generating station, the feeders being protected by overload devices at the points marked X.

nearked X.

If the overload devices in each phase are interlocked as described above, they will be unaffected by any fault on the system other than one in the individual pair of feeders. For example, a fault in either sub-station will be fed equally through the feeders in either pair whether from the source of supply or from running machinery returning current. If a fault occurs at P in feeders B, B, the feeders A, A, will still carry equal currents and only feeders B. B, will be affected.

A further device is required to discriminate between the two feeders B, B, and this may be obtained by arranging that the more heavily loaded feeder shall be cut out, for it will be seen in the example illustrated that the faulty feeder will carry most of the fault current.

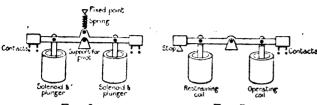

Fig. 6 shows diagrammatically a relay having the required

Fig. 6 shows diagrammatically a relay having the required characteristics. The operating coils are excited respectively from the two feeders, and the balance arm is biased to the

middle position. So long as the currents are equal the balance arm will be unaffected, but with an increase of current on one side the arm will be drawn down on that side and will close the corresponding pair of contacts to trip the switch in the feeder on that side.

On the faulty feeder being disconnected, the other becomes the more heavily loaded and some device is required to prevent its being disconnected. The only sound method is to employ auxiliary switches on the oil-switch mechanism to bring the coils into action automatcally. Satisfactory service has been given by such a device which automatically converts the protection into time-limit protection on one feeder on the failure of, or the deliberate disconnection of, the other.

F10. 6. BALANCED OVERLOAD RELAY.

Fig. 7. BIASED PROTECTIVE RELAY.

In practice a perfect balance of current between the feeders is not obtainable and there will be an appreciable excess current on one side or the other on a severe overload. The balancing difficulty can, however, be completely eliminated by a simple device which has been employed successfully on

E.H.T. service. Each feeder is furnished with a relay having two elements, one an operating element and the other a restraining element, as for example in fig. 7.

The operating coil is excited from the feeder which is being protected, and the restraining coil by the feeder in parallel with it. The arrangement is biased in favour of the restraining coil to the operation. with it. The arrangement is biased in favour of the restraining coil to the extent of say 10 per cent., by placing extra turns on that coil so as to make it more powerful than the operating coil by 10 per cent. Now unless the balance is upset by more than 10 per cent. the device cannot operate, and yet at normal load the device tends to operate immediately the fault current exceeds 10 per cent. of the normal load current. This eliminates all errors in balancing, whether in the relays current transformers, or feeders, and also the the relays, current transformers, or feeders, and also the maintenance of balance.

As interlocked overload relays are proof against overloads or faults occurring outside the parallel feeders protected, it will be seen that they are particularly suitable for the protection of a number of stations in series. All the devices may be set to operate instantaneously and at less than the normal load current, and yet none of them will operate except in the faulty section.

load current, and yet none of them will operate except in the faulty section.

Another method of eliminating the balancing problem is by the use of leakage relays interlocked in the same way as overload relays. These relays, as previously described, operate only on faults to earth, of which the extent can be limited by an earthing resistance. The relay settings will be in the neighbourhood of the maximum fault current, and thus even a 10 per cent. unbalancing is quite negligible. Seeing that most cable faults are faults to earth, and that of the faults between phases most develop first or simultaneously as faults to earth, this arrangement will successfuly remove the large majority of feeder faults and is proof against disturbances from

majority of feeder faults and is proof against disturbances from other sources. Two feeders can be protected by one relay instead of requiring three or six.

It will be understood that as leakage relays are inoperative on faults between phases, their employment only reduces disturbances, and the most severe disturbances, namely, those due to faults between phases, are left to produce an extensive or complete shut-down. The addition of interlocked leakage relays to a system otherwise protected by overload relays will improve the conditions but cannot be considered a real colution of the problem of protection. solution of the problem of protection.

solution of the problem of protection.

Reverse-current relays are now obtainable which will operate at about 3 per cent. of the normal working voltage and over a wide range of power factor, but below this voltage they are inoperative on currents of any magnitude. On a fault which develops practically instantaneously and reduces the voltage below this limit, the relays will be of no service.

The difficulty due to loss of voltage has been dealt with by making the moving parts unstable at low voltage, so that any movement initiated is completed. At full voltage the moving parts must be stable so as to ensure restoration of the relay and freedom from trouble due to vibration and sudden changes of load. Such relays have given satisfactory operation for a number of years. These improvements render the reverse relay almost independent of voltage. The application of the interlocking idea renders them unaffected by current fed back from sub-station plant and of surges in either current fed back from sub-station plant and of surges in either

direction.

Whilst well-designed reverse-current relays with potential windings will deal successfully with the majority of faults, it is to be noted that the faults with which they cannot cope are just those likely to occur as the result of bad design, bad workmanship, defective material, and carelessenss, and are those most disastrous in their results.

PROTECTION OF INTERCONNECTORS AND RING MAINS.

As the energy flow in a sound interconnector or ring main may be in either direction, varying with the distribution of load, reversal is no longer a sign of leakage. A leak of sufficient magnitude may so disturb the distribution that energy may flow into the faulty conductor from both ends. This condition is a sure criterion of a heavy fault. Attempts have been made to utilize this feature to obtain selective action. Attempts have

A pilot wire may be employed to take a sample of current from one end of the feeder to the other for use as a standard. The current at the remote end may then be compared with the sample to determine whether the direction or magnitude of flow is the same. The latter is the better course as the magnitude changes with the smallest leakage, but the direction will only change with a relatively large leakage.

This is the basis of the well-known Merz-Price protective system.

Current transformers are inserted at the two ends of the conductor to be dealt with and are connected through the

Fig. 8.—Protection of Interconnector by Balanced Voltage System.

In the balanced-voltage system diagrammatically illustrated in fig. 8 the current transformers are connected in opposition and the relays in series with them. In nected in opposition and the relays in series with them. In the circulating-current system illustrated in fig. 9 the trans-formers are so connected as to circulate the current between themselves under normal conditions. The trip coils are con-nected in shunt between equipotential points and carry only the difference current corresponding to the leak. The balanced-voltage system is best adapted for feeder protection and the circulating-current system for the protection of trans-

FIG 9.-MACHINE WINDING AND CABLE PROTECTED BY CIRCULATING-CURRENT SYSTEM.

former and generator windings, for all of which applications well proved designs are available. There is no better method of protecting existing feeders, and all generators and trans-

> GENERAL SOLUTION OF THE PROBLEM OF FEEDER PROTECTION.

Any arrangement capable of dealing with a single inter-connector can be applied to any cable in the system. The Merz-Price system is applicable to interconnectors, and is therefore a general solution of the problem.

A general solution of the problem.

A general solution has the immense advantage that one can ignore the protective gear when laying out the cable system, and that each and every feeder can be protected in a similar manner and by a self-contained combination of similar apparatus independently of all other feeders.

The split-conductor protective system is up to the present the best solution of the problem, for not only does this solution give an arrangement applicable to ring mains, interconnectors, and duplicate feeders—in fact, to all systems of distribution—but it gives an arrangement absolutely selective

distribution—but it gives an arrangement absolutely selective and so sensitive as to perform this function instantaneously at a fraction of the normal load current.

at a fraction of the normal load current.

The system requires the employment of a cable of special construction, or in the case of overhead lines a special arrangement of conductors. The construction involves but a slight departure from that commonly employed, and consists in the splitting or separating of each conductor into two parallel portions lightly insulated from one another.

Fig. 10 herewith illustrates a standard 0.1 sq. in. cable suitable for 20,000-volt distribution. Fig. 11 illustrates a similar cable constructed for use under the new system, and it will be seen that each core is split (hence the name). The

similar cable constructed for use under the new system, and it will be seen that each core is split (hence the name). The cable is constructed with an oval concentric core, this construction giving the best distribution of potential strain in the insulation. In small sizes this is especially valuable, and dispenses with the necessity for a hemp core within the copper conductor. Such cables are being manufactured at a cost but slightly exceeding that of the standard pattern, suitable for a wide range of voltages and currents.

The principle of the system is illustrated diagrammatically by fig. 12, which shows the connections for one split conductor. The split conductor is connected at each end to the usual switchgear equipment, consisting of oil switch, busbars,

by fig. 12, which shows the connections for one split conductor. The split conductor is connected at each end to the usual switchgear equipment, consisting of oil switch, busbars, etc., through a special current transformer. The current-

transformer core has two primary windings, to which the two halves of the split conductor are connected, and the core carries also a secondary winding connected to a relay controlling the oil-switch trip coil.

Under normal conditions, as in fig. 12, current entering the feeder at one end divides equally between the two parallel paths, being united again on the remote side of the

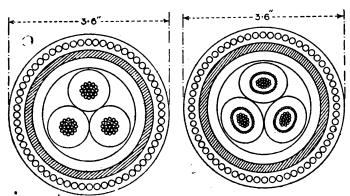

Fig. 10.—Standard 20,000-VOLT. 0.1 sq. in. CABLE.

Fig. 11.—Standard 20,000-volt o.1 sq. in. Split Conductor.

second current transformer. In each transformer the magnetizing effects of the two primary coils are equal and opposite, thus the transformer offers no impedance to the current flow, and the secondary windings and relays are unaffected. In case, however, a fault develops, for example at the point A in fig. 13, the fault current flowing towards A will

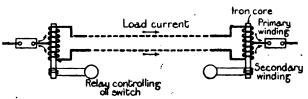

Fig. 12.—Split-conductor System—Sound Feeder.

upset the balance of current between the two primary windings in each transformer, thus producing a magnetizing effect on the secondary windings and exciting the relays.

The transformers also serve a second function in case the fault occurs near one end of the split conductor, as at B in

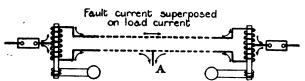

FIG. 13.—SPLIT-CONDUCTOR SYSTEM—FAULTY FEEDER.

fig. 14. In this case the fault current flowing from the left-hand end would divide equally between the two halves of the cable, were it not for the impedance of the transformer near B. The fault current flowing to B through the sound conductor traverses the two primary windings at B in the same direction, thus highly magnetising the core. The impedance so offered hinders the flow of current through the sound conductor and thus upsets the balance at the remote end, causing the simultaneous operation of both relays.

Fig. 14.—Split-conductor System—Fault at One End.

As the cores are not magnetized under normal running conditions, there is no core loss. In practice the core is of circular form, and the primary and secondary windings are

on reference to fig. 14 it will be seen that the arrangement is more sensitive at the end nearest the fault, as the whole fault current passes through the adjacent transformer winding in one direction. Advantage is taken of this to make the whole arrangement more sensitive by employing an oil switch with split contacts which separate the two halves of the conductor on breaking circuit. The switch nearest the fault will operate first, and on separating the conductors the whole fault current is then concentrated on one conductor at the other end, and brings out the switch there also.

This system is readily applied to overhead lines. In this case the half conductors may be run as separate overhead lines on the same posts.

As a general solution, however, the twin conductors are carried on common insulators and but lightly insulated one from the other. Spacers of insulating material are inserted at intervals between supports to keep the wires apart. Fig. 15 is an enlarged detail of the insulators. If a wire is broken and falls to the ground the line will be cut out even though the fallen line fails to make a good earth. This adds materially to the protection of the public rially to the protection of the public.

FIG. 15.—DETAILS OF INSULATOR.

The simplicity of this arrangement should be noted. There The simplicity of this arrangement should be noted. There are no pilot wires and no potential transformers. The relays are plain overload devices requiring no special adjustment. The transformers can generally be built with bar primary windings, a construction which gives the maximum of simplicity and safety. The secondary windings are subjected to no forces except on the occurrence of a fault in the individual feeder which has to be protected, however severely the system may be disturbed

may be disturbed.

It is difficult to connect up the apparatus incorrectly, but should the connections be crossed by mistake the switch will open immediately any attempt is made to put the feeder into service, and thus the mistake will be discovered.

It is not essential that the conductor should be divided into equal sections. If one section be made smaller than the other, say reduced to a single wire, this wire may be carried always within the other portion which will surround it. Any fault to earth or between phases must occur on the outer portion; thus it is unnecessary to provide for excess current in the

inner portion.

We may now substitute a relay of the balanced type shown in fig. 7. We connect the restraining coil to the inner wire and the operating coil to the outer conductor. The relay may be biased to an extent which fully covers all possible unbalancing, thus removing all occasion for balancing tests.

This arrangement is not quite so good as that above described, as the transformers cannot be constructed with bar primary windings, that for the fine wire requiring a multiple turn primary. On small installations such as colliery and industrial plants where the conditions accompanying short-circuits are not so severe as they are on the large power supply schemes, this objection disappears, and advantage may be taken of the cheapening of the cable and the elimination of balancing. This applies equally where such plants receive supply from the power companies, as the severest short-circuit conditions are only met with near the generating stations. stations

The balancing problem now presents no difficulties, although in the experimental stage some were experienced. It is necessary to balance both the reactance and the resistance of the twin conductors as it is the vector difference which is operative. This requires no attention in overhead lines, and is successfully accomplished by the adoption of simple precautions in the manufacture of the cables.

To meet all the requirements of electric supply there are now available a series of devices simple in character well

now available a series of devices simple in character, well proven in service, and giving a degree of protection hitherto quite unattainable. The series is as follows:—

(a) For the protection of all closed feeder circuits—the split-conductor system.

(b) For the protection of all open-ended feeder circuits, core-balancing system.

(c) For the protection of generators and banks of transformers—the circulating-current system.

advantages of the above combination summarized as follows:

mmarized as follows:—
 All the apparatus is simple in character.
 All the apparatus is self-contained and completely independent of that on other circuits.
 All the apparatus may be adjusted before installation.
 No feeder pilot wires are required.
 The relays are all simple contact-making devices operating on excess current and are of the same character throughout. In many cases direct-acting trip coils can be substituted.
 The relays are not subjected to any forces until they are called upon to operate.
 None of the devices are affected by surges.
 None of the devices are affected by variations of voltage or of power factor.

or of power factor.

9.	None of the devices is affected by faults occurring out-
10	side the sections controlled.
10.	All the devices will deal with faults between phases or to earth on systems with any number of phases.
11.	All the devices are instantaneous in operation.
	All the devices will operate at currents comparable
	with and generally materially less than the normal
19	load current.
10.	If incorrect connections are made this will be dis- covered on the first trial run.
	covered on the mist that run.

TRADE STATISTICS OF NEW ZEALAND.

The following figures, showing the imports of electrical and allied goods into New Zealand in 1913, are taken from the official statistics which have just reached this country. The comparative figures for the previous year are added and increases or decreases noted. Reference to these returns also appears on page 57 of this issue. It should be understood that the countries to which the goods are credited are not in every case the countries of manufacture, but merely those from

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUBBDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible mement. No letter can be published unless we have the writer's name and address in our possession.

Garage Heating.

As the problem of garage heating should surely be served by electricity, it would be very interesting to hear the views of other readers of the ELECTRICAL REVIEW.

electricity, it would be very interesting to hear the views of other readers of the ELECTBICAL BEVIEW.

As a contractor, I have been asked from time to time by many customers to make suggestions for heating their private garages, in some cases not only with a view to keeping the circulating water of the motor-car from freezing during the frosty periods of the year, but to prevent damage to upholstery, &c., from dampness, and I have had considerable difficulty in supplying their wants.

Manufacturers' knowledge on the matter seems to be very limited. Some have suggested luminous and radiant heating; others have even sent us on approval convectors running at red heat, wired with ordinary flexible wire, and without provision for earthing, ignoring our carefully-worded inquiries calling for suitable apparatus that would be safe to use where petrol vapour might be present and the danger from shock.

I find it impossible to get any data on the subject, although I found one firm who illustrated a "Garage Heater," which I was assured "would be quite satisfactory," but upon receipt found the elements glowed when in use. When complaining, I was told that I viewed the matter too seriously, suggesting that almost any electric stove would be quite safe to use.

Now, if the latter is the case, I should be only too pleased to stand corrected, but as I am confident that there is a demand for an inexpensive, economical and safe electric heater, if only to proteot the cylinders of cars when garaged against damage from first. I think that some account of others' experiences would be

teet the cylinders of cars when garaged against damage from frust, I think that some account of others' experiences would be interesting to manufacturers, contractors and supply engineers, as also to car-owners themselves. Perhaps some of your readers would oblige by replying.

Interested Inquirer. [We believe there is no danger in using glowers at a dull red heat (1,300° F.): the ignition temperature of petrol vapour in air is about 2,200° F., or bright orange. Certain slow-combustion stoves are commonly used in garages, so low-temperature electric radiators should be quite satisfactory.—Eds. Elec. Rev.]

From the Fleet.

On behalf of the electrical staff, I wish you and yours a Happy

and Prosperous New Year.

I shall look forward with much appreciation to the ELECTRICAL REVIEW, which, thanks to your kindness, I now receive regularly each Saturday. H. Christie, Electrician.

H.M.S. Bonaventure, c/o G P.O., December 29th, 1914.

German Agencies.

It seems hopeless to induce the Electrical Co., Ltd., to reply to any attacks that may be made upon them, and this more than ever convinces me that they have received their orders from Berlin in the first place as to what to do, and it is perfectly plain that they have been told to lie low and say nothing, and consider themselves an English firm until such time when they can blossom out again. In the meantime, the "foolish" Englishman will keep on support-

In the meantime, the "foolish" Englishman will keep on supporting them and provide profits to be sent to Berlin later on.

It would be interesting to know how many British contractors are foolish enough to purchase from firms like these, the head of which, as has already been stated, being one of the Kaiser's right-hand men in all his scheme of devilry. I should be glad if someone would consider the question of forming a league to advertise all firms like this throughout the whole of the British Empire, there being in addition to the Electrical Co. a large number of others posing as British which are absolutely German from beginning to end. It would certainly be worth while to take good care that the general public know about it.

I heard lately that the E ectrical Co. still have the audacity to call upon people and pose as a British firm offering to sell British-

call upon people and pose as a British firm offering to sell British-made goods, but it is apparent, I again repeat, that they have had their orders what to do.

One particular firm, the proprietor of which has an intense hatred for everything German, absolutely declined to believe me, hatred for everything German, absolutely declined to believe me, until I showed him the list of the shareholders of this company, and he based his opinion on the fact that they were offering to sell him nothing but British-made goods—and for a very good reason, I should imagine, as, seeing our Navy has tightened things up so much, it would be hopeless for the Germans to attempt to get anything out of their country, as it takes them all their time, with all their trickery and dodges, to get anything into it.

I should be obliged if someone in the different towns where this firm has branches would take this matter up to the point of directly

firm has branches would take this matter up to the point of directly insulting them to a certain extent, which might bring the matter to a head, as, so far as I can gather, in all the towns where their branches are situated they are still carrying on business as if nothing had happened, and just as if we were carrying on war with properly civilised people, whereas, from the records of the war so far, we are carrying on war with the foulest savages.

Contractor.

Advertising and Character.

As one whose business is concerned with engineers' advertising, I can concur wholeheartedly with the views expressed by you in your present issue, and with those of "Consultant."

An advertisement does, or should, reflect the character of the firm issuing the announcement. Humour has a place in advertising, though not in technical advertising. A funny cartoon may attract attention, but the chances are that it will not influence business. An advertisement of this nature may interest and amuse the reader, but the point is will it impress him with the quality. the reader, but the point is, will it impress him with the quality of the goods advertised; will it create a bias in favour of the specialities put forth? After all, readers of technical journals are engaged in serious work, during business hours: it is when the work is over for the day that they seek mental relaxation. Humour only appeals to a man when he is in the mood for it, and most of us are not in the right frame of mind to be amused when business calls for our whole attention.

A reader of a technical publication picks up his journal for information on his particular branch of trade. Well, if you are an advertiser, give him what he wants—data about your goods—and present this information as attractively as you can. Your object is to make your advertisement stand out from the pages of the as to make your advertisement stand out from the pages of the paper in which it appears; stand out distinctively so that it will attract, and create a favourable impression. Now an ugly advertisement may secure attention, but it will never cause a feeling of pleasure to arise in the mind of the reader. The four functions of any advertising announcement are: To attract attention; to create interest sufficiently strong to induce the reader to read the message and before him. put before him; to give a bias in favour of the advertised article; to get him to act, either by calling on the advertiser, by writing for a booklet or for information, or to purchase outright. The latter

depends on conditions, necessarily.

Many advertisers do not realise the value of plenty of white space. Wide margins will give an advertisement dignity and prominence, and do away with any impression of overcrowding. A comparison of the advertising pages will prove this. Let the reader try this in one of his own advertisements and he will appreciate the improvement.

Another failing with some firms is to use blocks of their

Another failing with some firms is to use blocks of their machines which are too large for the space they occupy. This makes the announcement look overcrowded and heavy, and furthermore, leaves very little room for the message.

In many instances it is a good plan to show the application of the goods offered. The value of pictorial representation cannot be over-estimated. A picture tells the story at a glance; but it must be appropriate. For instance, it is better to show an electric fan at work in a smoke-room, dispelling tobacco fumes, than to use just a plain cut of a fan standing idle. The first has life—"imagination"; the second is dull, uninspiring. But as I have said earlier, illustrations must be used with care and judgment.

And the same degree of care should be exercised in writing the "copy," that is, the text. Information should be tendered pleasingly but forcibly; just enough data to interest the reader

"copy," that is, the text. Information should be tendered pleasingly but forcibly; just enough data to interest the reader but not enough to satisfy him. The appetite wants to be whetted. You want him to write for more. Once he is in touch with you, the advertisement has done its work.

One final word. Let the advertiser select his list of papers with the same care which he uses in choosing his travellers. Having decided on his media let him stick to them, and not change from one to another every few months. The most successful advertisers are consistent advertisers. To keep changing from paper to paper means losing the cumulative effect. Very few salesmen call on a firm and get an order at the first visit; they keep calling on the best firms, in many cases for months and months before they open the account. In the same way your "silent salesmen," your advertisements, must convey their message at regular intervals. If any reader who is not satisfied with the results from his expenditure will only apply the suggestions I have made to his own case, I am sure he will experience greater success than he has obtained in the past, as these remarks are engendered by a close acquaintance with the subject under discussion. one to another every few months. The most successful advertisers

Ernest Ingram Hill.

Wimbledon, S.W., January 1st, 1915.

The letter from "Consultant," and your editorial thereon, remind The letter from "Consultant," and your editorial thereon, remind me of a conversation which I had with a man in the petrol-motor trade about reorganising several departments, and who, when it came to publicity expenses, emphasised a statement to the effect that his firm spent a lot on advertisement. "Pardon me," I said. "Your firm buy a good deal of space, but they never advertise." He was astonished, and could not grasp the difference for several

The above is the case with some 95 per cent. of the advertisers in this country in all trades. A very high percentage of the space taken is taken simply because it is usual to "advertise," and almost everyone else does it. Further, whoever is responsible for engaging an advertising manager or his staff, seldom has any for engaging an advertising manager or his staff, seldom has any knowledge of publicity work, and simply resorts to catch-phrases, such as "pulling copy," and the like, while the very meaning of "pulling copy" is unknown to the interrogator. Again, directors and managing directors seldom actually know what an advertisement is, and mistaking somewhat fluent space-filling for the genuine accomplishment, a highly efficient advertising man is not always engaged, as a man who can talk intelligently about his subject cannot make any more impression on another who does not understand it, so that the writer of hackneyed common-places stands as much chance of being engaged—perhaps common-places stands as much chance of being engaged—perhaps more, because he will be cheap. One of the results is that we get space very often filled with "dead" and very usual matter, while blocks suggest a trial set suspended in space or a vehicle stranded outside the works without a sign of "life" in sight. One could, of course, write at great length in dealing fully with One could, of course, write at great length in dealing fully with all the advertising ramifications of any special trade, but, speaking generally, matter in periodical advertisements should emphasise a leading line each week, or as often as the publication appears, with all the remaining or principal lines in rather smaller type, conveniently placed for reference. Illustrations should preferably show installations, and blocks should not be so highly finished or photographs so re-drawn as to produce a terribly wooden effect, which often has a particularly unfavourable result on overseas business. There is a whole budget of other practical advertising suggestions going for any firm who will begin to realise that mere space-filling is one of the most unproductive of expenses.

expenses.

If any firm could see their way to standardise and advertise prices for different-sized D.C. and A.C. motors they would touch a prices for different-sized D.C. and A.C motors they would touch a remunerative line. I believe, however, that as the prices of these machines vary so much with the circumstances, competition, &c., under which they are sold, it would be difficult to give publicity to figures. Such prices, however, would have to be from 12 to 15 per cent. below the official figures, which were thought to be high at one time.

Arthur Mallord Turner.

London, S.W., January 4th, 1915.

Alluding to your "critique" entitled "Advertisement and Character," one has but to move down a main street, to turn the leaves of a periodical, or to watch the speeding countryside from a flying track, to behold "Advertisement" tragic in its endeavour to appeal—humorous, in its analogy to the burdened washing line of Poverty's back yard.

The line is a necessity, so also is advertisement, but whereas we shun gazing at the one, also for natural instinct, we are the puppets of a moving show on the other.

If only advertisers would realise that their productive effort is for the *ninitiated*, and that the sure way to appeal to ignorance is by suggestion—knowledge gilded with subtle flattery—colour yells would cease to deafen, and the public, treated more as a sane community than a kindergarten, would be less liable to seek the haven offered by "the rainy day" theory.

A few well chosen lines leading up to the main scheme instead of an opaque mass of monochrome or futurist nightmare of colour,

and, again, a gradatory form of lighting advertisement for night work, would go far to procuring business and helping the trade. The elusive advertisement of a necessity lives longer than the one that strikes a solitary note and then is silent.

Trusting that the raising of the question will bring the matter

the notice it deserves.

Rex. C. Andersen.

A.C. v. D.C. for Lighting.

I am planning the illumination of a number of machine shops at present lighted by gas, by means of several thousand drawn-wire and half-watt lamps

Two electric supplies are available—D.O. at 240 volts, and A C.

110 volts 40 cycles.

As the class of work done in these shops is of very close nature and demands much local lighting, the low-voltage A.C. would be most suitable, but it has been suggested that A.C. lighting is more trying to the eyes, and that trouble may be experienced by the lights getting into synchronism with the moving machinery.

Personally, I should think the heat capacity of the filaments would prevent this, but perhaps some of my fellow-readers of the ELECTRICAL REVIEW who have had experience with A.C. lighting under similar circumstances will be kind enough to give their views upon the matter.

upon the matter.

Ex-Gas.

January 2nd, 1915.

WAR ITEMS.

Divisional Engineers-Royal Naval Division.-The Institution of Electrical Engineers is informed that it has been decided to form another Field Company of Engineers for the Royal Naval Division. It is desired that at least two sections of the new company should consist of highly-trained men, and applications are accordingly invited from members of the Institution between the ages of 19 and 35. It is understood that the rates of pay and the duties are the same as those of the Royal Engineers. the duties are the same as those of the Royal Engineers. Applications should be addressed to Captain Harrison, Adjutant, Divisional Engineers, R.N.D., 2. The Downs, Dover Road, Walmer. It will be remembered that the Engineer units of the Division consist largely of members of the Institutions of Civil, Electrical and Mechanical Engineers. Nearly 100 of those who joined these units since they were formed last September have received commissions in the Army.

Post Office Engineering Volunteer Training Corps.—
Although some 20,000 postal employés have joined the Colours, this number falls far short of the total number that would gladly enlist; but the necessity of maintaining the efficiency of the service, especially in the telegraph and telephone departments, compelled the authorities to retain the men in their customary occupations. There are in all nearly 50,000 men in the service of the Post Office in Lordon of whom over 7 000 belong to the Engineering Post Office in London, of whom over 7,000 belong to the Engineering and Stores Departments, and when it was proposed to form an Engineering Corps, to train the men who were not allowed to enlist, the response was enthusiastic. A commencement was made with 600 men, though fully double this number applied for enrolment and the corps was duly formed three weeks ago. The Comment and the corps was duly formed three weeks ago. with 600 men, though fully double this number applied for enrolment, and the corps was duly formed three weeks ago. The Commandant is Mr. H. C. Gunton, principal power engineer to the Post Office and engineering adviser to the Central Association of Volunteer Training Corps; the Acting Adjutant is Mr. G. F. Preston, Controller, London Telephone Service, and the Second Commandants are Messrs. A. J. Stubbs and W. Noble, Assistant Engineers-in-Chief, and A. Moir and J. M. G. Trezise, Superintending Engineers, London District. The Quartermaster is Mr. A. Parsona, Controller of the Stores Department, and the Company Commanders are Messrs. D. H. Kennedy. Assistant Superintending Commanders are Messrs. D. H. Kennedy, Assistant Superintending Engineer, London; A. Watts, Staff Engineer, Engineer-in-Chief's Office; G. F. Greenham, Assistant Superintending Engineer, London; and L. B. Turner, Assistant Staff Engineer, Engineer-in-Chief's Office. Drills take place in the evenings at the Inns of Court Chief's Office. Drills take place in the evenings at the Inns of Court Hotel, which has been acquired by the Post Office for a future telephone exchange, and a programme of field work for Saturdays and Sundays has been arranged. The A, B, and C companies are designated as air-line companies, and will erect temporary telegraph and telephone lines and stations in the field; D company is known as a field company, and will deal with permanent line construction and the heavier branches of engineering field work generally. The first Corps parade took place on Saturday last in the yard of the King Edward VII Building, and was followed by a route march of 54 miles.

The Volunteer Training movement has quickly overspread the whole country, and at least a million men are said to be training diligently in their spare time; but few corps are likely to make a better showing than the new P.O. Engineering Corps, which is recruited from an exceptionally fine body of men, very many of whom have been through the mill already whom have been through the mill already.

Board of Trade Electrical Exhibition: Open To-day.-Board of Trade Commercial Intelligence Department invites British electrical manufacturers and representatives of wholesale houses who have previously imported electrical accessories from Germany and Austria-Hungary to attend the exhibition of such goods that they have organised. The exhibition was opened yesterday at 32, Cheapside, E.C., and it continues open to-day, and various samples of German and Austro-Hungarian goods are on view. Many of these, no doubt, our firms have already come up against in the ordinary course of business, but the collection, as a whole, if anything like representative or complete, should be instructive.

German Methods in Australia.—A short time ago, in commenting upon methods of German electrical firms, Mr. Harper, city electrical engineer, Melbourne, stated (says the Melbourne Age) that it was often very difficult to perceive the German connections of many firms. Many German firms, like the Allgemeine

Electricitäts Gesellschaft, had their headquarters in Melbourne, and traded under all sorts of local names. The practice of removing name plates and manufacturers' marks was, he believed, a common one, and was being indulged in pretty freely at the present time. He was quite certain that England could supply the Colonies with every type and quality of electrical appliance required, and believed that Australia was, in fact, one of England's best customers in electrical goods.

In the course of an article on the "Duty of Australians," published in October, the Australian Mining Standard, which has ever since the outbreak of war made a weekly feature of a forceful anti-German campaign, made the following observations on the

anti-German campaign, made the following observations on the methods of German traders:—

"How thoroughly the Germans prepared for this war has been shown in many ways, and it is also becoming increasingly clear to what an extent their business men trading or having agencies in Australia were aware that this war was coming. It is significant as showing how thoroughly ostensibly peaceable firms knew what was coming, that many German accounts with Australia were, for the first time, allowed to fall into arrears towards the close of the first half of this year. Can we then trust a people such as this? Indeed, do we not know them to be a contract breaking people, whose signature to 'a scrap' of paper' is of no sanctity whatever? If we cannot trust them, have we any justification for continuing to deal with them? No, it is our duty, both on moral grounds and on grounds of policy, to have nothing whatever to do with a race so treacherous. Let it be added further, that, now we are thoroughly acquainted—but no, that is too much to say: let it be altered to 'now we are to some slight extent acquainted'—with the dubious and underhand methods employed by German firms for the furtherance of business in Australia and elsewhere, we will say deliberately and unhesitatingly that any municipality, any Government, any public concern whatever, accepting a contract from any firm representing German interests, will lay itself open to a very grave suspicion of having had its honour tampered with. It is notorious that some of the German firms trading in Australia set aside sums of money for use by their agents for purposes of bribery. Let it be made quite clear then that anybody, when this war is over, accepting the contracts of such firms, will be open to the suspicion of having been induced in this way to consent to the placing of a contract with a nation which has shown itself to be the deadly enemy of the Empire to which we belong."

Haslingden Corporation Contracts.—A long discussion took place at a recent meeting of the Haslingden Corporation Electricity shown in many ways, and it is also becoming increasingly clear to what an extent their business men trading or having agencies in

Haslingden Corporation Contracts.-A long discussion took place at a recent meeting of the Haslingden Corporation Electricity Committee upon the question of trading with Messrs. Siemens Bros. & Co., Ltd., and Mr. Snew-Huddleston and Mr. Hill, representatives of the firm mentioned, appeared before the Committee and explained the position and composition of the company. Eventually a resolution was moved to the effect that when tenders are required in future for electrical cables and goods, Messrs. Siemens Bros. & Co., Ltd., should be allowed to compete as heretofore. An amendment was brought forward that when existing contracts with the firm were completed the Corporation should chase trading with the firm, and 10 voted for the amendment and 13 against. The amendment, therefore, was lost, and the original resolution was subsequently adopted.

A Copper Famine.—According to a report from Switzerland, Germany is so sorely in need of copper that telegraph and telephone wires are being pulled down, at first in the less populous districts, and electric light cables will also be utilised to supply the need. The great gates of Antwerp Railway Station have been commandeered. According to the Times Brussels correspondent, the German authorities are requisitioning copper articles in all parts of Belgium. Copper saucepans, crucifixes, and holy water basins are being taken, and from a Brussels factory copper to the value of £12,000 has been requisitioned.

Sydney Council Contracts.—When the Sydney City Council had before it toward the end of October a recommendation of Mr. Forbes Mackay, the city electrical engineer, that three transformers be obtained from the U.S.A., at a cost of £5,097 (an English firm had tendered £1,000 less), it was explained that the American firm had guaranteed delivery within 13 weeks, and that the type offered by the British firm was not what the engineer wanted. As a result of the discussion in the Council (according to a report in the Sydney Morning Herald) it was decided that fresh tenders be called, confined to articles of English manufacture. The principal speaker in the discussion said that he believed in distributing a wage fund within the Empire in this supreme crisis. distributing a wage fund within the Empire in this supreme crisis, and not in sending their money to foreigners.

and not in sending their money to foreigners.

"One Clear Call."—This is the title of a pamphlet by Mr. A. H. Ashton, founder of the Voluntary Recruiting League, of which the latter has printed 100,000 copies for general distribution, with the object of stimulating the enlistment of recruits throughout the British I-les. The published price is ld., and copies can be obtained from the L ague at Empire House, Piccadilly, W. A selection of the opinions of eminent readers shows that the pamphlet has made an excellent impression on them, and is regarded as a valuable aid to recruiting. The author recapitulates the events which led to the outbreak of the war, and makes an effective appeal to the reader to enlist in the new Army, if he is eligible. All profits made from the sale of the pamphlet will be devoted to the furtherance of recruiting. the furtherance of recruiting.

Burnley Tramwaymen.—The War Office has expressed a desire that ex-non-commissioned officers on the staff of Burnley electrical tramways department should join the Army as instructors. Up to the present, 148 men have joined the ranks from the tramRoyal Flying Corps.—According to the Manchester Courier, the Royal Flying Corps military wing are calling for the following and other tradeemen:—Acetylene welder, æroplane mechanic, cable jointer, coppersmith, draughtsman (mechanical), electrician, fitter, instrument repairer, metal turner, pattern maker, wireless operator, driller, dynamo attendant, electric-bell fitter, machinist, motor fitter, switchboard attendant, tool grinder, wireless

man.

E.T.U. Men with the Forces.—In an article in the Herald on the policy of the Electrical Trade Union, the author, J. Kinniburgh, says that the membership is 8,000, of whom 10 per cent. are "fighting for our king and their country"; another large number are building warships, leaving "about 2 per cent., if that, out of employment."

Powerpul — M. F. B. C. Powerpul manager of Message Signals.

cent., if that, out of employment."

Personal.—Mr. E. B. C. Preston, manager of Messrs. Siemens Bros. Dynamo Works, Ltd., Rangoon, has been appointed a 2nd Lieut. in the Indian Army Reserve of Officers. He has been attached to the 32nd Sikh Pioneers at Sialkot, Punjab, and left Rangoon on December 13th for that place.

Owing to their not being allowed to enlist in the Forces for active service on account of the exigencies of the work of the department, the names of the following members of the electricity staff at Woolwich have been recorded in the minutes by the T.C.:—Mr. W. B. Wadie, assistant engineer; Mr. Walter Scott, acting charge engineer; Mr. J. Rhodes, stoker; and Mr. G. R. Smith, clerk.

Mr. Leonard J. Aron is in France serving as Corporal in the Army Service Corps, "Mechanical Transport," British Expeditionary Force.

Private Wm. Lonsdale, who was condemned to death for an assault at the Doberitz Concentration Camp, Berlin, but whose sentence is said to have now been commuted to one of ten years' sentence is said to have now been commuted to one of ten years' penal servitude, is a Leeds man, who was a reservist in the 2nd Battalion West Riding Regiment. He was called up from his employment as a tram conductor in Leeds at the outbreak of the war, and took part in the battle of Mons, where he was wounded and taken prisoner on August 24th.

Mr. Francis B. Shaw, A.M.Inst.C.E., A.M.I.E.E., electrical engineer to the Government of Siam, who recently contributed to our pages an interesting account of the Siam Electricity Works, has joined the R.N.V.R. armonred car division as Lieutenant, and

has joined the R.N.V.R. armoured car division as Lieutenant, and

The Manchester Tramways Committee has passed a resolution expressing appreciation of the excellent work done by Mr. J. M. McElroy (general manager) and the whole of his staff in connection with the war crisis.

with the war crisis.

In the list of certificates of naturalisation appearing in the London Gazette on January 5th, the following entry appears:—
Gerald Henry John Hooghwinkel (Netherlands), consulting engineer, 95, Linden Gardens, Bayswater, London. Date of oath of allegiance, December 10th, 1914.

Roll of Honour.—Private Matthew Partington, of the 3rd Loyal North Lancashire Regiment, an employé at the Preston electricity works, has been killed by a bomb dropped from a German seroplane.

German aeroplane.

Private Thomas Turner, of Dukinfield, who was employed as a driller at the generating station on Tame Valley, has been wounded whilst serving with the 1st Shropshire Light Infantry.

Lance-Corporal Ernest Mann, a motorman on the Manchester tramways, has received an official intimation that he is to be recommended for distinction for conspicuous bravery in the field.

Sergt. William E. Sayle, of Bispham, a driver on the Blackpool and Fleetwood tramcars, has been killed in action whilst serving in the Scots Guards.

in the Scots Guards.

REVIEWS.

Test Questions in Wireless Telegraphy. Series I and 2.—The Students' Library. London: The Wireless Press. Price 1/- each set.

These test questions are published in the form of a series of cards, 38 in Series 1 and 48 in Series 2. They are intended for students who are beginning to take up "wireless" as a profession, as well as for amateur wireless experimenters, and they provide a

convenient means of testing knowledge.

Series 1.—This series of 38 cards comprises 228 questions, roughly graduated from the very elementary principles of magnetism, electrostatics and current electricity up to questions involving considerable technical knowledge of wireless operations. In places the graduation is very rough, and in the cards numbered I to 10 there is needless repetition and very little method in the choice of questions; card 11 on the induction coil and the series of cards on waves show a much less random selection. The questions on the technical part of the work are certainly calculated to search out the weak points of the student who sets himself to work conscientiously through them, but even here a certain reckless mixing of easy and difficult questions is to be regretted.

The cause of the trouble is probably to be found in the suggestion that the student "can either choose a card at random, taking a new card each day, or he can work steadily through the set in numerical order." It is fairly obvious that one set of cards can scarcely hope to serve both purposes— the "random selection" method demands quite a different arrangement of questions from the "work through in order" method, and where the cards fail is in the attempt to fulfil these two conditions simultaneously.

Series 2.—This series of 48 cards comprises 288 questions, covering the whole of the ground in the theoretical section of the P.M.G.'s examination. The questions dealing with electricity and magnetism are based on the ordinary text-books, those which deal with wireless telegraphy on Hawkhead's Handbook of Technical Instruction for Wireless Students and those concerned with regulations on the

P.M.G.'s Handbook.

The failing noticed in Series 1 is conspicuous by its absence in Series 2, the questions being graduated with obvious care. This series is, indeed. admirable in every way, and the first 20 cards could be worked through with advantage by any student of applied electricity, while to the students of wireless the whole set should prove an invaluable aid to a mastery of both the theoretical and practical sides of his subject.—P.H.S.K.

Anleitung zum Bau Elektrischer Haustelegraphen Telephon Kontrol und Blitzableiter Anlagen. Berlin: Aktiengesellschaft Mix and Genest. 7th Edition.

This book, which was first published in 1890 and has now reached its seventh edition, occupies a position in the literature of weak-current installations somewhere between the ordinary maker's catalogue and the scientific text-book, though much nearer the latter than the former. Although it is published under the auspices of one of the large makers in this branch of the industry, and is illustrated by means of their own particular make of apparatus, the method of treatment distinguishes it entirely from the mere trade catalogue. It contains a clear and orderly account not only of the apparatus itself but of the principles underlying its construction and of the applications for which it is suitable.

It is, in fact, just the kind of book that the user. or intending user, with little technical knowledge would wish to have at hand as a guide to what can and cannot be accomplished by electricity in the house, office or works, in certain directions.

The contents deal with domestic bells and telephones, telephone exchanges, special types of telephone, mine signalling, sources of energy, line erection, and lightning conductors.

Electric Wiremen's Work. By J. H. HAVELOCK. 1914. London: Crosby, Lockwood & Son. Price 5/- net.

It is to be feared that Mr. Havelock lacks a due sense of proportion-at any rate as regards the relative importance of different sections of a wireman's work. For example, he devotes a large proportion of the first section of the book to the working out in every detail of a series of simple calculations, many of them by logarithms to 4 decimals, when a brief statement of the equation and the answer (which most people would work out on a slide rule) would have sufficed. Again, he wastes some 40 pages in reprinting I.E.E. rules and similar matter which one can obtain free from any insurance com-

The result of this is to fill up the book with a large amount of comparatively valueless material,

whilst many important subjects are scarcely treated at all. The whole subject of wiring in every kind of building, for example, (except mills and factories, which get an extra page), is dismissed in one-and-a-half pages, with another three pages of diagrams of but little real value. Again, there are nearly twenty pages of "problems" reprinted from old examination papers, but no diagram of any intercommunication system of telephones—one of the commonest requirements of the wireman.

Such a subject as the best method of wiring to suit various conditions is ignored entirely, as is also that problem, the answering of which is so important to the contractor, viz., which is the cheapest way to run wires between various lights, switches, etc., with due regard to economy of material and labour?

Whilst these defects are very apparent, there is much in the book which is of value. The chapters on practical work are the most useful, and the suggestion that every wireman should be able to diagram out a wiring problem and make sketches of his work is excellent. The statement that "all sketches should be neatly dimensioned" would have been more pointed if it were not for the fact that out of the seven sketches that are reproduced as illustrations four are without dimensions!

Mr. Havelock has made a framework on which a useful book could be built, but there must be a good many omissions and additions and a number of corrections to the present matter before the book attains to its best value.

Light, Radiation, and Illumination. By PAUL HÖGNER; translated by Justus Eck. London: Electrician Printing and Publishing Co. Price 6/net

It would have been better, we think, if this book had been published primarily as a mathematical treatise, for looking at it from a practical point of view we have to confess ourselves very disappointed. The preface announces that it is "intended to assist electrical engineers, architects, and others in planning lighting installations, with special reference to arc lighting." The last paragraph, however, points out that "an exact mathematical solution is not always possible . . . as so many causes influence the result in uncertain ways," etc., etc. Although this may be read in the preface we find in the text abstruse calculations which are carried to a very fine point. It should be a comparatively easy matter to amend the formulæ given so that they could quickly be applied and understood by those whose mathematical knowledge is only elementary, and yet be sufficiently correct for all practical purposes.

The first chapter deals with light emission from

surfaces, and the formulæ are given in such a manner that many prospective readers would put the book down at once; in fact, it is assumed that one is thoroughly acquainted with the rules and laws relating to the subject. Light emission from bodies is next dealt with, and generally speaking all the steps in the calculations are clearly shown, but unfortunately we begin to stumble over some of the many mistakes which the volume contains. Too much is taken for granted, as for example on page 9, $I = \frac{1}{8} d^2 \times \pi \times h$ (1 + cos a) is said to be "easily seen"; similar "obvious" statements occur throughout the book, and are not conducive to its being well understood.

Having considered matter relating to the above headings we arrive at the real object of the work and learn of the light emission from arc lamps. This subject is well treated from all points of view, and the author is very frank regarding the lack of reliability of that type of unit. Many interesting and useful facts regarding illumination are closely dealt with.

Again somewhat cryptic references are made, and it is unfortunate that nearly all the elaborate tables

given contain a multitude of figures which compare a 10-ampere old type of arc lamp with a modern 12ampere proprietary flame arc, so that they can be of but little service. The pages following may possibly be useful to some engineers, but we very much doubt whether the matter put forward will appeal to any but those who have a large amount of time on their hands. We have very carefully studied the formulæ and tables, and as yet fail to realise their practical importance save for those particular lamps for which they are worked out; conclusions may be drawn which are entirely erroneous, especially since full details of conditions are not given. This is particularly the case with table XXV, and we think that the author could be, with advantage, more explicit; also many illuminating engineers will disagree with the statements put forward, for the arguments savour of considerable bias. The figures in table XXVI, which state the minimum requisite illumination, are in many cases very similar to American figures, and are abnormally high when compared with English practice. The writer fails to point out that the sizes of the units with which he deals are somewhat prescribed. In example 2, on page 48, there is apparently one of the frequent omissions which the book contains.

Unidirectional illumination is next considered, and again one finds remarks which are seemingly contradictory; careful study will, however, disclose the fact that the punctuation of the fourth paragraph of section 35 is incorrect; nevertheless the matter itself is of exceptional interest.

The book concludes with a section entirely devoted to calculation methods; these are full of novel features but of doubtful service, for although curves and tables are worked out in a most elaborate manner, the context itself leaves much to be desired in the way of explanation, and we are of the opinion that in the stress of modern business it is almost impossible for the engineer to prepare the necessary data for every type of unit which might be used; the methods given are ingenious but laborious.

As previously stated, this work contains much for those wishing to study the subject treated from an academic point of view. It is to be regretted that the author has confined his attention to certain units; had he generalised his examples and tables the book would have been of greater service. We would also suggest that more care might have been taken in the proof-reading, since errors and seeming contradictions abound, so that the book is scarcely of the standard usually attained in the admirable series published by our contemporary.

BUSINESS NOTES.

Consular Notes.—SPAIN.—The United States Consul at Seville says:—There is a special call at this time for electrical machinery. The Consulate already has received inquiries from firms desirous of importing electrical motors, &c., but the smaller lines of supplies, fixtures, &c., will probably be furnished, as heretofore, by a German firm that has a factory for this class of goods in Barcelona. There are several well-equipped electrical goods stores in Seville, and people of the better class are taking to the use of fans, irons, water-heaters, foot-warmers, and kindred articles, all of which are shown here. The import duty, however, has been an obstacle to the development of the trade. Electricity is supplied at low rates for industrial purposes, and there is a growing tendency towards a larger use of electrical equipment. Most of the smaller towns and villages are, or are being, equipped with electric light. Catalogues, if they are to be of any use at all must be in the Spanish language and include the quotation of net prices, weights per unit and in quantities, numbers packed in the case, quotations on complete machines, including all accessories, measurements set up and knocked down, and probable cost of packing and shipping. It is scarcely necessary to say that a salesman with the actual goods to show can do more business in an hour than catalogues in a year.

Trade During 1914.—The MIRRLEES WATSON Co., LTD., report that their brisk business of the last few years slackened off materially during the first half of 1914, mainly because sugar planters with phenomenally good cane

Digitized by Google

crops had to be content with phenomenally low prices for their products. Foreign financial dislocation, through the war, has further depressed matters, preventing some promising schemes from maturing, and hindering the placing of much customary business of a less degree of importance. Shipping difficulties, increase in cost of material, and shortage of labour, have accentuated crease in cost of material, and shortage of labour, have accentuated that trouble, particularly as regards the latter, no fewer than 77 men from the offices and workshops having left to join the Territorials and Regulars. Notwithstanding all this, a fair amount of work has been undertaken, and prospects for the coming year seem good. 'Apart from the sugar-making and general machinery departments of the business, it may be mentioned that the condensing department has been kept employed throughout. Amongst the larger sizes of installations is one for the Leeds Corporation electricity works, the surface condenser in this case having 46,000 as a ft. cooling surface—probably the largest surface condenser in electricity works, the surface condenser in this case having 46,000 sq. ft. cooling surface—probably the largest surface condenser in existence. A very large number of rotary air pumps of "Mirrlees-Leblanc" type have been supplied, including several for the Maritime Service, and we understand that the working results have been very satisfactory. A steam "Multijector" air pump on a new principle is now being made for marine purposes.

The Chamber of Commerce Journal for January contains that journal's usual annual trade review—if anything can be called usual relating to last year. It comprises 60 pages of matter written by experts in leading trades and industries, and reports from special correspondents in all Home, commercial and industrial centres. In the editorial of which an advance proof has been sent to us the

the editorial, of which an advance proof has been sent to us, the writer takes a very hopeful view of the outlook, confirming the opinion of the Chancellor of the Exchequer that after the war there will be some four or five years of prosperity for British industries. On the question of the capture of German trade, the writer expresses the opinion already voiced in our own pages, that it is not the German and company the like the contraction. ti is for the Government and commercial men alike to carefully study the possibilities of Germany unloading stocks of goods here at below cost price after the war, and to devise means for dealing with this problem, which will be so urgent and difficult in the near

Calendars and Diaries. - Messes. Nalder Bros. and THOMPSON, LTD., of 97A, Dalston Lane, London, N.E., have sent us one of their wall calendars with monthly sheets for 1915; it is

of the usual size and in the familiar style.

From Messes. Thermit, Ltd., of 27, Martin's Lane, London, E.C., we have received, as in previous years, a pocket note-book, with calendars for 1915 and 1916. The opening 36 pages contain illustrated material concerning the Thermit process and some

general information.

general information.

MESSRS. STEWART & LLOYDS, LTD., of Winchester House, E.C., adhere to the same form and appearance as in previous years for their wall or desk calendar for 1915; monthly cards are fitted in a white frame bearing a gilt monogram, the whole forming one of the neatest of the New Year souvenirs that reach us. THE VICTA ELECTRICAL Co., of 60, Queen's Road, Battersea, S.W., have issued a wall calendar for 1915, with monthly slips. From MESSRS. W. T. HENLEY'S TELEGRAPH WORKS Co., LTD., Blomfield Street, London Wall, E.C., we have received a wall calendar with weekly slips. The words 1837 and 1915, placed on either side of a view of the Tower of London, remind us that the business is one of the oldest established in the industry, while the excellence of the calendar shows that the firm knows how to do a thing well in 1915.

how to do a thing well in 1915.

A calendar with monthly sheets has been received from the NAVY EMPLOYMENT AGENCY, of 25, Victoria Street, S.W., where from among men who have served in the Royal Navy or Royal Marines, engineers, artificers, electricians, mechanics and other

Marines, engineers, artificers, electricians, mechanics and other workmen, can be engaged.

MESSRS, BRECKNELL, MUNRO & ROGERS, LTD., of Thrissell Street, Bristol, have prepared a wall calendar with neat and small monthly date slips below a view of London. An impressive panoramic view executed in effective colouring embraces both sides of the Thames, as seen looking up the river from the Tower Bridge, bringing within its compass the many buildings and other features typical of metropolitan and national greatness coming between the Tower of London on the one hand, and the Houses of Parliament on the other. With feelings of pride, one is reminded of Blucher's celebrated remark, "What a city to sack!"

THE WESTINGHOUSE BRAKE CO., LTD., of 82, York Road, King's Cross, N., have issued a calendar for 1915. Monthly tear-off sheets each bear a half-tone illustration of an application of the Westinghouse-Morse silent rocker-joint chain drive.

Westinghouse-Morse silent rocker-joint chain drive.

DAVENPORT ENGINEERING Co., Bradford.—A calendar for 1915 has been issued by the firm. The card depicts some of the firm's cooling towers and a block of daily date slips with clear figuring is attached.

MR. CHARLES H. BLUME, of Fitzalan Square, Sheffield, is sending out two good rules to his friends, one is of 5 in. in length and can be used as a letter opener; the other is, of course, to use "Megomac" and "Insulac" varnishes.

MESSES. GILLESPIE & BEALES, of Amberley House, Norfolk Street, Strand, W.C., have issued a war calendar which is bound to be a favourite. Its strongly patriotic note and the unobtrusive manner of printing of the firm's name will ensure for it a place on our own walls, and we can give no better testimony. The design includes the flags of the Allies, the heads of their respective nations, and our military and naval leaders in the struggle. The importance of our naval and aerial fleets is fully taken into account

pictorially.

THE BRITISH THOMSON-HOUSTON Co., LTD., of Rugby, has prepared a large hanging calendar, with a sheet for every month of 1915. The calendar differs, as usual, from all others received at

this office, by reason of the fact that each sheet includes the preceding and following month in addition to the current one. Each sheet contains a bird's-eye view of the Rugby Works and an

sheet contains a bird's-eye view of the Rugby Works and an illustration of one or other of the firm's manufactures.

THE VARLEY MAGNET CO., LTD., of Woolwich, have issued a serviceable wall calendar for 1915, with monthly tear-off sheets.

From MESSRS. MAWDSLEYS, LTD., of Zone Works, Dursley, we have received a wall calendar, with neat little monthly date slips for 1915. In the selection of a subject for the pictorial feature, "Her Favourite Flower," which is executed in colour, the firm have shown the excellent taste that has always marked their choice in such matters. in such matters.

Bankruptcy Proceedings.—WILLIAM HENRY WOOD, electrical engineer, Lorna Doone, School Lane, Hall Green, Birmingham, Warwick.—The adjourned public examination of this debtor was held at the Court House, Corporation Street, Birmingham, last week, before Mr. Registrar Lowe, when debtor returned his liabilities at £470, and his assets at £1,228, the estate disclosing an apparent surplus of £759. He stated that he did not consider himself to be insolvent, but that owing to the action of a limited company, of which he was managing director, in refusing to pay his salary, and in making an illegal call on shares, he had been forced into such a position that he could not immediately meet his liabilities, but his assets more than covered them. Questioned by ham, Warwick.—The adjourned public examination of this debtor the Official Receiver with regard to the assets, debtor said that the book debts were due from the company of whose action he complained, and they were the subject of an action now pending, the company disputing their liability to pay him. Nevertheless he regarded the debts as good, and he should say that if the company had got any money they ought to pay the debts. He admitted that the only tangible asset was a small balance from the furniture. In October, 1912, he acquired the lease of half an acre of land at King's Road, Tyseley, upon which a factory was built, and a limited company was promoted for the purpose of carrying on the business of electrical engineers, and especially for manufacturing machinemade brass work for most trades. He borrowed money to equip the factory. In April, 1913, the company was registered with a nominal capital of £8,000, and altogether about 6,000 shares were subscribed for. He agreed that the concern had a fair amount of working capital, and that there was no reason why it should not have been successful. Friction arose between the directors and debtor, and he was requested to keep away from the works, at any rate for a time. This he protested against through his solicitor. From that time his salary ceased. The complaint against him was that the work was not turned out as it might be, but he pointed the Official Receiver with regard to the assets, debtor said that the from that time his salary ceased. The complaint against him was that the work was not turned out as it might be, but he pointed out that the offence, whatever it was, was condoned by a subsequent agreement he had with the company on terms which, if the concern had been successful, would have paid him better. This was dated January 9th last, and no further complaints were made. He had received no notice to terminate his services. The examination was

For Sale.—Coventry Electricity Department have for disposal by tender one 600-kw. McLaren-Siemens generating set, particulars of which are given in our advertisement pages.

Electrical Industry in Scotland.—A correspondent writes:—"Electrical firms in Glasgow and the West of Sootland are pressed with orders. The Electric Control, Ltd., have supplied several very large controllers, including four 600-HP. three-phase controllers for high-pressure hydraulic pumps, each taking 900 amperes to start, and many automatic sets for air compressors in shipyards, of 200 to 350 HP. The firm are now fulfilling the order for the automatic controllers for what will be the largest order for the automatic controllers for what will be the largest electric lifts in the United Kingdom, each lift being operated by 250-H.P. three-phase motors. Messrs. Drysdale & Co., Ltd., Yoker, Glasgow, have provided a large installation of electrically-driven pumping plant for the Port of London Authority for use as impounding pumps. A feature in shipbuilding work is the growing popularity of the 'Hele-Shaw Martineau' electric hydraulic steering gear. At present Messrs. John Hastie & Co., Ltd., are completing four sets for new battleships, and two sets for torpedo-boat destroyers, and also a large number of sets for plant for Japan, Sumatra, South America and Australia, in addition to all descriptions of electric plant for ordnance and ammunition workshops. The 'Quartowatt' electric heaters have been placed on board many new ships, including various new British India liners, to take the place of steam heating. The West of Scotland firms have a good share of urgent War Office and Admiralty work. An East of Scotland firm, Messrs. Hawthorn & Co., Leith, specialise in electric slipway haulage machinery, and are shipping specialise in electric slipway haulage machinery, and are shipping out a set of 600 tons to Auckland Harbour, also a set of 800 tons capacity for Peru.'

Spagnoletti Developments.-In regard to the recent enlargement in the business of Spagnoletti, Ltd. (established 1851), and the change in its title, we learn from the directors that a factory has been erected on an extensive site at Park Royal, London, N.W., and further, that the company will in future by known as the PARK ROYAL ENGINEERING WORKS, LTD. Except for additions, the directors and staff remain unchanged. The factories have been specially designed on up-to-date lines with a view to handling the large switchgear and instrument output manufactured for the Admiralty, War Office, and many Corporations to whom the company are contractors. A history extending over 63 years is a long one in the electrical trade, and so lengthy an experience, combined with well-equipped factories, should go far to ensure a successful career for the new company.

Catalogues and Lists.—British Thomson-Houston Co., Ltd., Eugby.—Price list No. 2,510 describes and gives dimensions of B.T.H. shaft couplings.

MESSES. SIEMENS BROS. DYNAMO WORKS CO., LTD, Caxton. House, Westminster, London, S.W.—The firm have issued a new eight-page printed list of lantern slides that are held in stock at Caxton House for lending free of charge to lecturers, schools, &c.
The list has been revised and enlarged, and now consists of 208 different views, covering all classes of electrical machinery and apparatus manufactured by the firm at Stafford and Dalston.

Ediswan & Swan United Electric Light Co., Ltd., Ponder's End.—Four picture postcards have been issued, showing the application of Royal Ediswan drawn-wire lamps in different departments of the household. Quantities bearing customers' names, &c., will be supplied on application. The company have also issued correspondence poster stamps as a "Symbol of Electric Service."

GENERAL ELECTRIC Co., LTD., 67, Queen Victoria Street, London, E.C.—New illustrated and priced leaflet (O.S. 1.878) of Osram half-watt drawn-wire lamps, 1,000 and 2,000 CP. Also No. O.S. 1,852, a new four-page list, the front page of which bears the "leading light" coloured poster design (reduced, of course!), the contents being illustrated particulars and prices of various types of Osram lamps with bayonet caps.

MESSES. J. H. TUCKEE & Co., King's Road, Hay Mills, Birmingham.—New folder (No. 1) describing their latest ironclad

DAVENPORT ENGINEERING Co., Bradford.—This publication consists almost entirely of half-tone photographic views of Holehouse's patent natural draught chimney cooling towers as supplied by the company to various electric light and power authorities, collieries, and woollen mills, also line drawings of interiors of the

MESSES. SIMPLEX CONDUITS, LTD., 116, Charing Cross Road, London, W.C.—Thirty-six page list, giving descriptive information regarding their Plexeim system of electric heating and cooking, and illustrations and prices of a complete range of appliances, including many designs of kettles, irons, hot-plates, &c. Four distinct types of electric ovens are illustrated, and electric urns, large and small water-heaters, hot cupboards, and larger electrically-heated appliances are also shown. heated appliances are also shown.

Dissolutions and Liquidations.—Schleyder's Eco-NOMIC STEAM FURNACE (CONTINENTAL), LTD.—This company is winding up voluntarily, with Mr. R. W. Ednie, of Craven House, Kingsway, WC., as liquidator. A meeting of creditors was held on January 4th.

FELGATE INSTALLATION Co., LTD.—A meeting of creditors is called for January 11th, at the Reading Gas Co.'s Lecture Hall, by the liquidator, Mr. A. G. West.

ARGENTINE ELECTROLYTIC SYNDICATE, LTD.—A meeting will be held at 17, Albion Street, Hanley, on February 8th, to hear an account of the winding up from the liquidator, Mr. R. E. Clark.

ABBOTT, POPE & Co., builders and electrical engineers, 248, Belsize Road, Kilburn, N.W.—Meesrs. J. Abbott and A. Pope have dissolved partnership. Debts will be attended to by Messrs. Abbott & Pope, at 42, Bolton Road, St. John's Wood, N.W.

Abbott & Pope, at 42, Bolton Road, St. John's Wood, N.W.

SPAGNOLETTI, LTD.—In pursuance of Sec. 188 of the Companies'
(Consolidation) Act. 1908, a meeting of the creditors will be held
at 34, and 36, Gresham Street, London, E.C., on January 19th.
The Park Royal Engineering Works, Ltd., purchased the entire
issue of debentures in Spagnoletti, Ltd., and the new factory now
being completed, the liquidation of Spagnoletti, Ltd., has become
necessary. Certain of the assets, in which are included the stock
and book debts and work in progress, have been transferred to
the Park Royal Co. in full satisfaction of the debentures, the new
company at the same time having undertaken to discharge all the company at the same time having undertaken to discharge all the existing trade liabilities of Spagnoletti, Ltd. The meeting is a formal one.

Machine-Stoking at Blackpool,—MESSRS. EDWARD BENNIS & Co., Ltd., of Little Hulton, Bolton, have installed four of their chain-grate stokers at the Blackpool Corporation electricity works, fitted with the Bennis-Miller-Bennett patent links, the distinctive feature of which is the device of halving the link at the point of junction with the next link in the series, making an point of junction with the next link in the series, making an uninterrupted sequence which, it is claimed, prevents the admission of excess air. The grates are fitted to water-tube boilers of the B. & W. type. An 8-hour test made with new slack, having a calorific value of 12.012 B.TH.U., gave an evaporative duty, as from and at 212° F. per lb. of coal, of 9.7 lb., and a total thermal efficiency of 78 per cent. Two chain-grates were at first supplied to the order of the Corporation, and the results being in every way satisfactory, the order was given for two additional grates. The grates are working with natural draught. This and other successful installations are mentioned in a pamphlet on "Chainsuccessful installations are mentioned in a pamphlet on "Chain-Grate Stoking," recently issued by Messrs. Bennis, copies of which may be had on application.

-H.M. Consul at Rome (Mr. C. C. Morgan) reports that an agent in that city wishes to secure the representation of United Kingdom manufacturers of electrical goods. The name can be ascertained at the Board of Trade Commercial Intelligence Branch, London. Other inquiries should be addressed to the British Consulate, Rome.

-The Practical Electrician's Pocket-Book Notices .-Book and Diary. Edited by H. T. Crewe. London: S. Rentell

and Co. Price 1s, net.—The sixteenth edition of this popular pocket-book has been issued, having undergone an exceptional repocket-book has been issued, having undergone an exceptional rearrangement and condensation; new chapters have been added, on electric clocks, electricity in coal mines, and distributing systems, and new sections deal with half-watt lamps, C.T.S. wiring, Zed fuses, &c. Not the least of the attractions of this little companion is the neat format and excellent printing by which it is distinguished; the illustrations are particularly good, and so long as the present high standard of production and composition is maintained, the book need fear no competitor.

the book need fear no competitor.

Deed of Assignment.—Geo. Braulik, 8, Lambeth Hill, E.C., &c., electrical engineer.—Mr. G. E. Corfield, the trustee in this matter, in giving a statement of his receipts and payments, says that the terms contained in the deed of composition and assignment between the debtor and his creditors, has so far been carried out. The trading operations of the debtor, under his supervision, are being well maintained, and he expects to be able to fully carry out the conditions of the deed and eventually discharge the whole of the said composition of 10s in the £ whole of the said composition of 10s, in the £.

Trade Announcements.—The business of Alderman R. H. Mason, electrical and general engineer, of Lorne Street, Oswestry (Salop), has been taken over by Messes, Darling and

THE MIDLAND ELECTRIC WIKE Co., LTD., or Leicester, have removed to Lutterworth, and all communications should be addressed there in future.

The address of the firm mentioned in the first of our trade announcements last week, is 32, County Buildings, Corporation Street, Birmingham, not 32, Corporation Street.

LIGHTING and POWER NOTES.

Accrington.—New Gas Plant.—The electrical engineer reports that the new No. 3 gas producer plant is now in operation, and the gas cleaning and sulphate plant has had trial runs. The gas-engine plant arrangements are progressing, but only one new engine is at present in use. The total fuel cost per unit generated by the steam plant was '379d., and for gas plant 273d.

Argentina.—Residents in the city of Santiago del Argentina.—Residents in the city of Santiago del Estero being dissatisfied with the charges made by the Compania Eléctrica del Norte, appointed a Special Committee to study the contract made between the Government and that company. As the municipal authorities will do nothing, the public have decided to defend themselver. The Committee thinks that the reason of this municipal indifference is that they owe the company more than \$20,000, and do not, therefore, dare intervenc.—Review of the River Plate.

ASCOT.—SEWAGE PUMPING.—The Windsor R.D.C. has decided to consider electricity for sewage pumping as an alternative to the Diesel plant originally proposed. The estimated capital cost of the installation—current being taken from the local works—is £4,775, made up of the following items:—Mains in duplicate, booster, &c., £2,750; two 100-H.P. motors and pumps, one 80-H.P. motor and pump, £1,200; building, £500; foundations £100; contingencies, £225. The estimated annual cost is £720.

Australia.—The Melbourne City Council is proposing to substitute metal filament for carbon lamps for renewals of not less than 40 watts and to charge an extra ½d. per unit when such

renewals are carried out by the Council.

It is proposed to invite tenders for 62,500 assorted metal lamps, at an estimated cost of £3,906. The city electrical engineer estimates a reduced revenue of £6,000 per annum owing to the

agreement with the Australian Electric Supply Co. for electric lighting in the town.

The Toowong (Q.) Council has decided to establish an electric lighting scheme for the town and to apply for an Order in Council.

The Dalby (Q.) Council has prepared plans and specifications for

an electric lighting scheme.

The Brunswick (Vic.) Council has accepted the offer of the Commonwealth Bank of a loan of £10,000, for extending the electric light and power system in the city. It is proposed to introduce electricity into every street in the municipality.—Tenders.

Barrow.—The electrical engineer reported that it would be necessary, at an early date, to consider some further extension, with a view to maintaining the pressure at Walney. A 150-kw. rotary converter has now been installed at the Farness Railway Works, and a balancer and switchgear has been fitted in the Furness Abbey sub-station.

Beaconsfield.—In order to safeguard the Council's interests, the U.D.C. has decided to formally oppose the London Electric Supply (No. 2) Bill.

-Extension Scheme.—The Corporation has approved, subject to certain conditions, of the extension scheme submitted by the Tramways and Electricity Committee on the report of the city electrical engineer; the cost is estimated at £28.3)1.

Birmingham.—Temporary Supply Station.—At a recent meeting of the City Council, the Electric Supply Committee were to ask permission to erect and equip a temporary supply station at Nechells, at an estimated cost of £97,000, to meet the urgent demands of local manufacturers engaged on Government work. In view of the urgency of the work it is proposed to proceed with it in anticipation of L.G.B. sanotion. To meet normal demands it was intended to install 5,000 kW. of temporary plant at the Aston Manor station, but since the end of September applications for the supply of 11,000 kW. for power purposes have been at the Aston manor station, but since the end of September applications for the supply of 11,000 kW. for power purposes have been received, and a still greater demand is anticipated. Of the estimated £97,000 to be spent on the temporary plant, some £10,000 for buildings, foundations, &c., will cease to be remunerative when the plant is dismantled. The permanent Nechells power station will not be available for supply purposes until the winter of 1916-17.

Bradford-on-Avon.—Prov. Order.—The U.D.C. has sent a letter to Mr. J. H. Edwards, of Bristol, asking when he intends exercising the powers granted him by the prov. order

Bradford.—It is stated that despite the war, the number of units turned out at the electricity works is constantly increasing. Slight extensions of plant are being made when new textile buildings are erected, but, says our correspondent, it appears to be a somewhat difficult task to persuade owners of old mills to install electricity.

-The Electric Power Sub-Committee has Brighouse. recommended the Electricity Committee to make a further reduction of 1d, per unit for the supply of energy through a generator for cinematograph purposes, subject to a minimum consumption of 3,000 units per annum.

Chile. - A decree has been published approving the scheme presented by Don Herman Bernales for the installation of an electric lighting and power system for the town of Casablanca. -Board of Trade Journal.

Continental Notes.—Belgium.—The Belgian town of Continental Notes.—Belgium.—The Belgian town of Zeebrugge, which has become prominent during the war, is at the mouth of the Bruges Ship Canal. Its entrance lock is equipped with 80-ft, wide rolling gates operated by electric motors. An adjacent power station, which contains two 200-H P. Willams steam dynamos supplying D.C. at 440 volts, is reported to have been destroyed by British warships, together with the lock gates. SPAIN.—A concession has been granted to the Sociedad Anonima Hidro-electrica Ibérica, to utilize the waters of the Rio Mijares, in the district of Fanzara, for the production of electric power.—Board of Trade Journal.

Coventry. - NEW SUB-STATIONS. - The City Council has decided to purchase land in Walsgrave and Foleshill Roads, for the erection of electricity sub-stations.

Cuckfield (Sussex).—Prov. Order.—The B. of T. has called the attention of the R.D.C. to the stipulations of the prov. order granted to the Mid-Sussex E.L. and P. Co. which had not been carried out, and asking for the Council's observations as to the order being revoked. The Council has decided to make no order being revoked. The observations on the subject.

Darlington.—Extension Scheme.—The Electricity Committee has prepared a scheme for the extension of the works, comprising new generating plant and the erection of larger buildings, the cost being estimated at £20,000.

Dover. - New Plant. - A Sub-Committee of the Electricity Committee has been formed for the purpose of considering the steps to be taken to provide for additional alternating current plant, to ensure completion of the work by next autumn.

Edinburgh.—ELECTRICAL TRADES PROTEST.—The local electrical traders have petitioned the T.C. against the clauses in the proposed prov. order, giving the T.C. power to supply and hire electrical apparatus (except for lighting), and to open showrooms in the city, &c. The protest has been signed by a 100 firms in the trade as well as by 35 firms on behalf of the local Ironmongers' Association. Amongst other things, it is stated that the Corporation has not accepted the offer of co-operation by the traders made as a result of previous proposals of the same kind. There made as a result of previous proposals of the same kind. There are also numerous private electrical showrooms in the city. The terms of the prov. order will be considered by the T.C. on January

-THAMES FLOOD.-Owing to the flooding of the Esher.river at Molesey, water entered the low-lying pipes of the Twickenham and Teddington Electric Supply Co., and the Esher supply was cut off.

Finchley.—YEAR'S WORKING.—With reference to the note which appeared in our last issue under this head, we are informed that there was a credit balance shown in last year's accounts of £2.278, not a debit balance of £2,116, as mentioned by our correspondent.

-The Frinton and District E.L. and P. Co., Frinton.-Ltd., has decided to appeal against the assessment of its undertaking. The appeal will be defended by the Assessment Committee of the Tendring Union.

Glasgow.—For about 15 minutes, on Saturday evening, the centre of the city was deprived of its electric light, and much inconvenience was caused among the shopping crowds and the spectators at picture houses. The cause was a short circuit on two of the mains leading from Port Dundas power station, with the consequent overloading of the machinery running at the time. the tramways department supplies its own power, the cars were not interfered with.

Greetland.—The Electrical Distribution of Yorkshire, Ltd., has informed the U.D.O. that it had not been able to proceed with the erection of the sub-station at Greetland on account of the war, but the estimates for the station would be considered early in the new year, and it was hoped that the building would soon be in course of erection.

Halifax.—The Electricity Committee has refused an application made by the War Refugees' Committee for the free use of electricity in the houses occupied by Belgian refugeee

India.—According to the Indiaman the Madras Government has had before it during several years a scheme for generatment has had before it during reversit years a scheme for generating electric power from the Pijkara Fall for the purpose of lighting the principal stations on the Nilgiris. As it is more than probable that this enterprise will not soon emerge from its present form, the Municipal Council of Ootacamund has passed a resolution, subject to the approval of Government, sanctioning the employment of Mr. Fulton, representing a Ceyl m firm of electricians, to prepare plans and estimates for a proposed scheme to light the station and supply power to private and business houses. The idea is to derive the power from the St. Lawrence Lake. The estimated cost of the enterprise is Rs. 50,000.

Llandudno.—Proposed Loan, &c.—The Urban Council has decided to make application to the L.G.B. for sanction to borrow 4926 for supplying and laying a new feeder cable from the works to a feeder pillar to be erected in Mostyn Street. The Council refused the application for a free supply of electricity for the headquarters of the local Battalions of the Welsh Army Corps, and ordinary rates are to be charged.

GREATER LONDON SCHEME.—The Standing London. Conference of Metropolitan Municipal Electricity Undertakings has passed a resolution to the effect that the L.C.C. electricity scheme is prejudicial to the development of electricity supply in London, and to the interests of the Borough Councils owning electricity undertakings, and contrary to the interests of the ratepayers. ratepayers.

BETHNAL GREEN.—The Electricity Committee is to submit to the B.C. an estimate of £15,944 for the supply and laying of cables, &c., in connection with the new electricity undertaking. The Committee proposes to stipulate in the contract for cables and accessories that they shall be of British manufacture.

WOOLWICH.—BULK SUPPLY, LOANS, &c.—The B. of T. has sanctioned the arrangement for bulk supply of electricity between the Woolwich B.C., the South Metropolitan Electric Light Co. and

the West Kent Electric Co.

The Electricity Committee has consulted Sir John Saell with a view to his report, submitted to the Council in 1912, being brought up to date. This report has been considered by the Committee, and an estimate has been forwarded to the Fnance Committee of the further expenditure, amounting to £32,935, necessary to complete the works recommended. Ia addition to the 3,000 kw. turbo-alternator now on order, further boilers, and another 1,000 kw. motorconverter are necessary. The Council has authorised the Committee to obtain tenders for the necessary plant, and, if necessary, the services of Sir John Snell will be obtained to interview the L.C.C with a view to obtaining the longest periods for the repayment of

with a view to obtaining the longest periods for the repayment of the proposed loan.

MARYLEBONE.—The returns of the Electricity Department, for the September quarter of 1914, show that 2,811,607 units were sold, a decrease of 972 units as compared with the previous year. The revenue was £30,203, an increase of £43, and the generation and distribution expenditure £15,152. Due to more economical plant the generating costs were '573d. per unit as against '644d. in the 1913 September quarter. For the half-year to September 30th, the amount available for capital charges was £31,597 as against £29,992, and the increase in the available balance amounts to £1,605.

The B.C. has decided to petition against the L.C.C. Greater

The B.C. has decided to petition against the L.C.C. Greater London Supply Bill and the London Electric Supply (No. 2)

Maidenhead.—The T.C. has decided to appoint a station superintendent at the electricity works, in order to free the electrical engineer for other necessary duties.

Manchester.—Owing to the darkness of the Christmas holidays, the consumption of electricity for the three days showed a considerable increase, the figures being, for 1914, 594,400 units,

and, for 1913, 583,820 units, an increase of 10,580 units.

A representative of the Withington Committee of the Corporation has been deputed to interview the chairman of the Electricity Committee as to lighting main roads at Withington by electricity.

New Zealand .- LAKE COLERIDGE SCHEME. - The inauguration of the hydro-electric power scheme took place on November 25th, the Premier, the Hon. W. F. Massey, switching on the current - New Zealand Shipping and Commerce.

Nottingham.—PROPOSED LOAN.—The Electricity Committee is recommending the City Council to apply for sanction to borrow £20,000 for underground mains and services.

Oldham. - Supply of Motors. - With reference to complaints which have been made by the Chamber of Trade that the electricity department of the Corporation is competing with the local electrical traders in the supply of motors, a deputation of the E.L. Committee is to meet the Chamber to make a statement on the matter. At a meeting of the Electricity Committee last week it was stated that the complaints of the Chamber were very unfair. The Committee tried to work with the traders, but if a on the matter. man came to the electricity station and would not go to a private trader for a motor, it was only natural that the Corporation should supply him, rather than lose a customer for energy.

LOAN SANCTION.—The T.C. has received the sanction of the L.G.B. to a loan of £40,000 for additions to the plant at Greenhill Works and for the provision of cooling towers.

Works, and for the provision of cooling towers.

Runcorn.—Prov. Order.—Subject to the work being carried out within a given period, the R.D.C. has decided to consent to the application of the Warrington T.C. for a prov. order in the parishes of Stockton Heath, Latchford Without, Thelwall, Grappenparishes of Stockton neason, Association, hall, Lower and Higher Walton, and Appleton.

Salford.—Proposed Loans, &c.—The Electricity Committee has decided that in all cases where separate premises in the occupation of one consumer are supplied with energy at the sliding scale of charges, such premises be regarded as separate premises, and charged accordingly, except in the case of a consumer under contract where the conditions of supply are specifically agreed upon. Application is to be made to the L.G.B. for sanction to borrow £18,252 for the provision and equipment of a transformer station in the Greengate District, and £25,000 for the extension of H.T. mains and provision of L.T. mains.

Walsall.—The R.D.C. has concluded an agreement with the Walsall Corporation for a supply of energy to the new pumping station at Rushall. A new showroom was opened on Tuesday, in connection with the Sales Department.

West Bromwich.—PROPOSED LOAN.—The T.C. has been recommended to apply for sanction to borrow £2,450, required to cover the cost of future extensions of mains.

Wimbledon.—The B.C. has decided to supply electrical energy to houses occupied by Belgian refugees and their helpers, also to the Wimbledon Recruiting Committee for lighting purposes at 11d. per unit.

The borough electrical engineer, as the result of a canvass in Worcester Park, is to include applications signed by 17 residents in the application to be made for permission to supply electricity in certain roads in Worcester Park.

Wrexham.—The T.C. has arranged to supply current to the military huts being erected at 3d. per unit, and to extend the mains along King's Mills Road, to supply new property, and to provide five public electric lamps in place of gas.

TRAMWAY and RAILWAY NOTES.

Aberdeen.—Tramway Purchase.—The Corporation Tramways Committee has received a letter from the Suburban Tramways Co. regarding the proposed purchase of the undertaking by the T.C., stating certain terms and conditions upon which a basis of purchase might be arranged. It is understood that the terms mentioned would be about equal to a payment of 30s, per share to the shareholders of the company.

A petition against P.A.Y.E. cars from users of the tramways in Great Western Road and adjoining streets has been sent to the T.C. Great Western R and and adjoining streets has been sent to the T.C. The petitioners state that these cars are disliked by both drivers and conductors; that risk of accidents is incurred by drivers having to operate the barrier regulating the exit, thereby diverting their attention from the front; and that the conductors have to stand on the platform of the car practically motionless, having no opportunity of exercise, and consequently during the winter season the cold will be most trying. The petition concludes by saking that these cars he at once discontinued and the former by asking that these cars be at once discontinued, and the former system reverted to.

Brighouse.—The General Purposes Committee has decided not to consent to the Halifax Corporation's tramway proposals in Brighouse.

Belfast.—The Corporation tramways are not giving the results anticipated, the reason given being the number of extensions recently made, which have not proved remunerative enough to defray the expenses incurred. The war, too, has seriously affected the traffic, no fewer than 16,000 Belfast men, exclusive of reservists and special reserve men and yeomen, having left to join the new armies since the war opened.

Chile. - The anti-German riots in Valparaiso, originating in the doubling of the tramway fares, were repeated for several days and necessitated cavalry charges, in which several persons were injured, to disperse them. In the meantime the tramway cars have been boycotted.—Review of River Plate.

- ITALY. - Electric traction has just Continental. been introduced on the Turin and Savona Railway, for passenger traffic only, on the section of the line across the Apennines, between the latter town and Coval, a distance of 29 miles. This section, which is the heaviest part of the line, includes the Beibo tunnel, about 3 miles in length, with maximum gradients of 1 in 40. The maximum speed is 31 miles per hour. Savona, after Genoa and Ventoe, is the principal coal port in Italy; it is also an important manufacturing town, with large steel works.—Railway

Derby.—ELECTRIC TOWER WAGON.—The Corporation has purchased an Edison electric tower wagon for use in connection with the electric tramways. The vehicle, the chassis of which is designed for a load of 20 cwt., is equipped with a battery of 60 E ison cells having a capacity of 190 ampere-hours, or sufficient to enable a distance of 42 miles to be covered, at an average speed of 12 miles per hour.

Doncaster.—PROPOSED LOAN.—The T.C. has decided to apply to the L.G.B. for sanction to borrow £8,550, £5,500 of this being for the purchase of six new tramçars.

TRAMWAY Halifax.—Proposed EXTENSION.—The Tramways Committee has decided to extend the tramway track to Southowram, on condition that the Southowram U.D.C. guarantees to pay £200 per annum for the first five years, £150 per annum for the second five years, and £100 per annum thereafter, such payments to terminate when the undertaking to Southowram is financially successful.

Huddersfield.—Arrangements for the extension of the tramways ria Bradford Road to Brighouse have now been completed by the two Corporations.

London. - Stepney. - With reference to the opposition of the B.C. to the electrification of the L.C.C. tramways in Grove Road and Burdett Road, except on the conduit system, the B. of T. has intimated to the Council that it would not be prepared to with-hold consent from the proposals of the County Council on the ground that that authority do not propose to equip the line on the conduit system, or on the ground that the lines are to be renewed conduct system, or on the ground that the lines are to be renewed in such a way as to facilitate their equipment for electric traction on the overhead trolley system. The Board submitted a copy of a communication from the Poplar B.C. showing that the boroughs of Poplar, Hackney and Bethnal Green have agreed to the overhead system, &c.

Northampton. - Owing to the war, the new tramway to Far Cotton has not yet been fully brought into use, due to the delay in completing a railway crossing near the terminus. It is hoped that as a result of negotiations with the railway company the full service will shortly be inaugurated.

Rhondda.—Proposed Tramway Extensions.—The U.D.C. is applying for powers to construct additional lines of electric tramways in the district.

Salford.—CAR-SHED EXTENSION.—The T.C. is to be recommended to apply for permission to borrow £6,553 to cover expenditure connected with the erection and completion of a proposed extension to the central car depôt at Pendleton.

Stainland.—The U.D.C. has decided to support the Halifax Corporation Bill, which provides for extensions to the tramway system.

Stoke-on-Trent.—TRAMWAY ACCIDENT INQUIRY.—As a Stoke-on-Trent.—IRAMWAY ACCIDENT INQUIRY.—As a result of the Coroner's inquest into the death of the driver—who was found dead on the platform of his car after it had run away on December 14th—evidence was given showing that the car was equipped with the air-brake, but that only the driver could control it; also that the conductor did not apply the hand-brake on account of the greasy nature of the rails. Medical evidence showed that the driver died through rupture of an aneurism of the heart, which might result from a sudden strain, and that this would not have been detected from examination. On behalf of the company which might result from a sudden strain, and that this would not have been detected from examination. On behalf of the company it was stated that some of the cars were so equipped that the conductor could control the air-brake, but people might tamper with the apparatus. Mr. Dickinson, Birmingham Corporation tramways, who examined the car and found it in good order, said that his Corporation had 300 cars fitted with a controlling device at the rear, and more were on order. The verdict was in accord with medical evidence, with a rider respecting the provision of rear control of the brakes. control of the brakes.

U.S.A.—TUBE RAILWAY FIRE.—On Wednesday morning an outbreak of fire occurred on the New York Subway at a time when it was crowded with traffic. We gather that some cable insulation became ignited at a time when, according to the Times, some 500 trains, containing 300,000 people, were at a standstill. Several hundred passengers were rendered unconscious by the smoke, and were rescued by through gratings at street-level by the fire brigade, one person being killed and at least 200 injured. The subway service will be suspended for some days.

TELEGRAPH and TELEPHONE NOTES.

A Telephonic Probe.—In the British Medical Journal Sir J. Mackenzie Davidson points out the difficulty of accurately localising a bullet or other foreign body with the X-rays, unless stereoscopic X-ray photography is employed. On the other hand, he states that the telephone can be advantageously used for this purpose by connecting one terminal to a moistened electrode which is applied to the patient's skin, and the other terminal firmly to a metallic instrument such as a probe or forceps. Directly the probe touches metal embedded in the tissues, a grating sound is heard in the telephone, due to the voltaic cell thus formed. This method, especially when employed in conjunction with stereoscopic photography, greatly reduces the time occupied in the search and the disturbance to the patient's tissues. On the other hand, it is stated that in modern warfare the removal of bullets from the body is not very necessary, as their presence is usually without harmful effects. Sir J. Mackenzie Davidson points out the difficulty of accurately is usually without harmful effects.

Argentina.—The Government having proved that two Argentina.—The Government naving proved that two steamers belonging to the Hamburg South American Co. which fly the Argentine flag had misused their wireless installations, thereby infringing Argentine neutrality, has issued a decree on the question. By this all coasting vessels are to have their apparatus/sealed by the port authorities, and some are only to be used in case of danger. Wireless operators are to be Argentine citizens and will be considered as agents of the maritime authorities.—

Review of River Plats. Review of River Plate.

Bolivia .- Owing to difficulties which have arisen in connection with the carrying out of the contract entered into some connection with the carrying out of the contract entered into some months ago by the Government of Bolivia and the Marconi Co., for the erection of a number of wireless stations, Congress has now authorised the Executive Power to resoind the contract.—Review of River Plate.

Cheap Telegrams for the Forces.-Special arrangements have been made for the transmission of week-end letter telegrams at about one-fourth the rate of ordinary telegrams between British sailors, soldiers and nurses in Europe and the extra-European British possessions. Inquiries concerning casualties will be transmitted free of charge. These arrangements do not apply between this country and the Continent.

Illicit Wireless Apparatus.—Amateurs who have not surrendered or otherwise got rid of their wireless apparatus of all kinds should take warning from the case of R. Softley, of Ramsgate, who was fined £15, with the alternative of six weeks' imprisonment, for being in possession of apparatus in sections without the written permission of the Postmaster General. Evidence was given that the parts could have been assembled in four hours, and would then have been capable of receiving wireless messages from Garmany. ges from Germany.

Romford.—The master of the Romford Workhouse is to draw up plans and estimates for reorganising the whole of the intercommunicating telephone system, the service having been disorganised owing to the recent rough weather. It is proposed to connect up five more buildings in the institution.

Storm Interruptions.—The effects of the storm on December 28th were even more serious than was at first supposed, December 28th were even more serious than was at first supposed, especially in respect of telephonic communication; up to Friday last London was cut off from the north beyond Birmingham, from the West of England and from Ireland. The telegraphs were much less affected. The trouble was much reduced by the effective cooperation of the telegraphs and telephones. The interruptions less affected. The trouble was much reduced by the effective co-operation of the telegraphs and telephones. The interruptions were due to the force of the wind, and not, as usual, to soft snow clinging to the wires.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—Sydney.—March 15th. Municipal Council. Transformer testing apparatus. Specification from City Electrical Engineer. A copy can be seen at the Board of Trade C.I. Branch in London.

in London.

ADELAIDE.—January 27th. Accumulators, and power board, for Postmaster-General. See "Official Notices" December 18th.

February 10th. Testing instruments, for Postmaster-General. See "Official Notices" January 1st.

February 17th. Victorian Railway Commissioners (Spencer Street, Melbourne). 3,300 tons of steel rails, 232 tons of steel fish-plates, 5,000 flame are carbons for arc lampe. Specification, &c., may be seen at the Board of Trade Commercial Intelligence Department in London.

BRISBANE.—January 13th. Switchboard cable, for Postmaster-General. See "Official Notices" to-day.

March 10th. Motor-generator, power board, &c., for Postmaster-General. See "Official Notices" to-day.

Tunbridge Wells. - January 26th. Cooling tower and pipework, two water-tube boilers, economisers, mechanical stokers, pipework, and feed heater, for Borough Electricity Works. See "Official Notices" January 1st.

CLOSED.

New Zealand.—The Auckland City Council has accepted the tender of Messrs. Richardson, M'Cabe & Co. for overhead cables, £913; lead-sheathed, £4,210 8s.; V.B. cables, £1,516.

Bradwell.—The Joint Isolation Hospital Committee has accepted the tender of Mr. John Richards, of Leek, for the installation of the electric light at the new hospital buildings, at £415. Three tenders were received, the highest being £494.

Derby.—The T.C. has accepted the tender of Messrs. Newton Bros. for an electric hoist, with motor, at £52 1s.

.. Dundalk. - The U.D.C. has received the following tenders for electric light wiring for artisans' houses:—Mr. T. P. Curran, Broughton Street, £73 19s. 8d.; Messrs, Gaskin Bros., £66; and Mr. P. J. Watters, £79 13s. It was decided to accept the lowest ender, and to have all the houses wired, the engineer to submit a scheme which would enable electricity to be supplied for cooking purposes. - Irish Builder.

Eccles.—The Electricity Committee has accepted the tender of the British Westinghouse Co. to supply consumers' meters for a period of 12 months.

Glasgow.—The T.C.'s Committee on Health recommends coeptance of the offer (£3,976) by Messrs. Johnston, Park & Co., Glasgow, for the electrical installation at the new hospital at Robroyston. The Clyde Navigation Trustees have accepted an offer by Mr. Lackie, on behalf of the Glasgow Corporation, to make, for £105, the extension of the switchboard panels for the main cable connections in the electric sub-station at Yorkhill.

Grimsby.—The Public Lighting Committee recommends the acceptance of the tender of Mesers. Ed. Bannister & Co., Ltd., for an annual supply of Sherwood fine slack to the electricity works, at 6s. 41d. per ton.

Liverpool.—The City Council has been recommended to accept the tender of the Edison Accumulators, Ltd., for the supply of a 2-ton battery electric motor vehicle for the Tramways Committee.

London.—Stepney.—The Electricity Committee reports having purchased 5,320 tons of coals for the Electricity Department at prices varying from 11s. to 16s. per ton.

The following quotations have been received by the Electricity

Committee for a supply of carbons :---

10 16 6 15 12 6 Hesp & Johnson, U.S.A.

The Electrical Engineering and Equipment Co., Ltd.,
Switzerland 16 0 0

The Committee states that it understands that there is only one firm at present manufacturing carbons in this country, and that this particular firm are not at the present time manufacturing

carbons of the type required.

BETHNAL GREEN.—The B.C. Electricity Committee has received the following tenders for the supply of high and low-tension cables and for the execution of roadwork in connection with the scheme for the supply of current in the borough :-

Brit. Insulated & Helsby	Cables,	Ltd.	••		mm en	ded)	£12,499
W. T. Henley's Telegraph	WOLES (<i>,</i> 0,	• •				12,586
Johnson & Phillips, Ltd.	••					• •	12,618
Siemens Bros. & Co	• •		• •				12,661
Western Electric Co	••			••			12,784
Callender's Cable and Con	struction	Co.					12,887
W. T. Glover & Co	••	••			• •		12,948
Union Cable Co							19,949

Mr. H. W. Couzens says that the tender recommended is the lowest in point of view of the lump sum and also the schedules for lowest in point of view of the lump sum and also the schedules for the various classes of work required. The price quoted shows a saving roughly of £2,000 on Sir John Snell's estimate for the work contemplated, which, the Committee states, is largely due to the decrease in the price of copper. In view of the fact, however, that the price of copper is rapidly advancing upon the market price which obtained at the date of the tender, the Committee states that it is desirable that the contract should be proceeded with as early as possible, and it has, therefore, decided in accordance with Mr. Couzens's recommendation. The following tenders have been received for the supply of transformers and high and low-tension received for the supply of transformers and high and low-tension switchgear :-

		E.V	vo 500-k.v.a. nd two 250 v.a. 8-phase ansformers.	H.T. and L.T. switchgear for two sub- stations.	Total.
Johnson & Phillips, Ltd			£924	£2,182	£8,056

Electrical Apparatus Co			-	5,960	_
•					

Reporting upon these tenders, the Committee states that in each section the lowest tender is based upon the assumption that the contractors will supply materials differing in some respects from those included in the specification. Mr. Couzens recommends the acceptance of the tenders of the British Westinghouse Co., which are practically identical with the specification. In this instance also the amount of the tender shows a substantial saving as com-

also the amount of the tender shows a substantial saving as compared with Sir John Snell's estimate.

Messrs. Napier-Kimber, Ltd., have received the contract for wiring for electric light at the National Health Insurance Commission, Leonard Street, E.C., for H.M. Office of Works.

Manchester.—The Educational Committee has accepted the tenders of Mesers. R. O'Brien & Co. and Mesers. R. Seddon and Sons for electrical work in various schools.

The Tramways Committee has accepted the tender of the J. G. Brill Co. for tramway trucks.

West Bromwich.—The tender of the British Westinghouse Co. is recommended to the T.C. for acceptance for a supply of E.H.T. and L.T. switchgear, and rheostats; as is also that of the New Conveyor Co. for extending the coal bunkers at the works.

Woolwich .- The following tenders have been accepted by the Electricity Committee :-

John Spencer & Co.—Steam pipes, £91. Mechan & Sons.—Water and exhaust pipes, £1 Herbert Morris, Ltd.—Travelling crane, £355

FORTHCOMING EVENTS.

(Yorkshire Local Section).—Wednesday, January 18th. At 7 p.m. At Philosophical Hall, Leeds. Paper on "Automatic Protective Switch-gear for Alternating-Current Systems," by Mr. E. B. Wedmore.

NOTES.

Copper.—The quantity of copper in stock and generally available for European consumption, known as European supplies, is, at the present time, of only relative value in estimating the copper position, as no returns of French or German stocks have been issued since July 31st, 1914. Messrs. Merton's statistical tables for pseued since July 31st, 1914. Messrs. Mercon's statistical tables for December 31st, 1914, give this quantity as 35,432 tons. Deducting French and German stocks, the figure is 25,923, compared with 26,240 tons at the end of November, and 21,558 tons (with the same omissions) for the end of December, 1913. The figure for Eoglish stocks is 21,098. The quantity under the same head at the end of 1913 was only 15,258 tons.

the end of 1913 was only 15,258 tons.

Compared with the average for the 12 months ending July 31st, 1914, American supplies are still low, and Spain and Portugal to England and France, very low. From the not specifically detailed source "other countries," however, 8,521 tons have been received during the month, nearly double the average quantity received before the war. Chile shipments for December, 1914, were well above the pre-war average, Australian shipments being still rather below. Total deliveries, at 31,708 tons, are 9,167 tons higher than the preceding month. the preceding month.

Institution and Lecture Notes.—Birmingham and District Electric Club.—The tenth annual report of this club shows steady progress. The membership stands at 80 as compared with 72 on the corresponding date in the previous year. Mr. A. E. Morgan, who had been hon treasurer since the formation of the club, resigned, and, as a mark of appreciation of his services, he was never morely elected as her life vice preciation. unanimously elected as hon. life vice-president. The report ended with a reference to the temporary loss of the valuable services of the popular hon. sec., Mr. W. G. L. Riddle, business calling him to the Far East. It was decided that the ordinary member's subscription should be reduced from 6s. to 5s. per annum. The balance in head was £32 10s 21d. in hand was £22 10s. 81d.

Electrical Association of Australia. — The first annual general meeting of the Victorian Section of the Association took place on Monday, November 30th, when the formation of the new Society was celebrated by means of a "Smoke Social Evening." The Victorian Institute of Electrical Engineers has joined with the NEW Electrical Association under the chew new title the the N.S.W. Electrical Association under the above new title; the the V.I.E.E. forms the Victorian Section.

What did the Glass Contain?—" Now we see only in a glass darkly, but when on the conclusion of peace we see things clearly we shall realise the degree of stability and stamina unings clearly we shall realise the degree of stability and stamina which has sustained the body commercial during the period of the war. It may be that even our ancestors will marvel that the strain, the wearing, nervous strain of the war, could have been borne with such fortitude, equanimity and resource, and with so little effect upon the everyday routine of the industry." That round table has much to answer for!

Portable Chemical Fire Extinguishers. -Portable Chemical fire Extinguishers.— The British Fire Prevention Committee, after an extensive series of investigations, to meet the danger of badly made liquid chemical fire extinguishers, the defects in which had resulted in fatalities, has issued a complete specification, which covers all points as to size, strength, precautions against bursting, directions for use, facilities for testing, &c., of importance in such appliances. The public are reminded that ordinary buckets of water (together with hand pumps) are equally, if not more, effective in the majority of cases, and further, have considerable economic advantages for ordinary purposes. ordinary purposes.

American Electrical Exports for October,-The following data regarding the electrical exports from the United States for the month of October are published by the American Electrical Review and Western Electrician. The total value of Electrical Review and Western Electrician. The total value of electrical shipments in October was less than 60 per cent, of that for the corresponding month of 1913; it also was slightly lower than the total for September, but considerably higher than the figure for August, the first war month. In the four classes for which numbers of articles shipped are reported, there were exported in October the following:—electric fans, 428; arc lamps, 359; carbon-filament lamps, 38,293; metal-filament lamps, 229,168. In the following table are given the detailed figures for the different classes for October of last year and of 1913:—

Educational Notes, — NORTHAMPTON POLYTECHNIC INSTITUTE.—At the annual presentation of prizes and certifica'es by Lord Moulton last month, in his report on the ecssion's work, Dr. R. M. Walmsley said that the reorganised system of evening education by the L.C.C. had deprived the Polytechnic of many junior students, but, on the other hand, the Poet Office policy of improved staff education had added between 200 and 300 students to the classes in Technical Telegraphy and Telephony, theory and practice. The dearth of optical instrument makers was particularly serious at present, and made the completion of the new annexe specially desirable. All the engineering students had been placed in workshops during the summer vacation, or, in the case of certificated fourth-year students, had found favourable employment. About 250 students and members of the staff had joined the Colours, and the war had naturally reduced enrolments this session by several hundreds. Educational Notes. - Northampton Polytechnic

by several hundreds.

Lord Moulton said that his work as chairman of a special Board of Trade and Government Committee had shown him to what an extraordinary extent England had become industrially dependent on Germany. The time had gone by when industrial success depended on making the best of limited available scientific knowledge. There were now available stores of information on which it was possible to base definite policies with the certainty of success, and the country which best took advantage of such information would lead all others in industrial competition. To some extent England had undoubtedly fallen behind other countries, among them Germany, in securing and applying technical education, but given the realisation of the extreme importance of basing our own work on what was already known—and hence of voluntary devotion to preliminary study and labour—England could and must show that she was no more intellectually and industrially decadent than she was decadent in military prowess.

King's College.—Faculty of Engineering.—Next term of Trade and Government Committee had shown him to what an

KING'S COLLEGE.—FACULTY OF ENGINEERING.—Next term begins on Wednesday, January 13th. Particulars are given in our advertisement pages to-day.

Legal.—CLAIM FOR ELECTRICAL GOODS.—In the City of Legal.—CLAIM FOR ELECTRICAL GOODS.—In the City of London Court, on Tuesday, before Mr. Assistant Registrar Tattershall, a claim was made by Otto Bohndel, proprietor of Schoen Bros., electrical accessories manufacturere, 29, Cock Line, against Messre. S. H Liwin & Co., electrical engineers, 29, Walton Street, Chelsea, for the sum of £1 10s. 2d. for electrical switchblooks supplied. The defendant, Mr. Lewin, was said to have given the order for the goods to the plaintiff personally. The defendant, who was requested to cross-examine the plaintiff, said:—"We are perfectly well aware we owe the money, but these goods are made in Germany. We have had the pleasure of doing business with Schoen Bros. for 10 or 12 years, and I have paid their accounts." When the war started they received a demand for payment of the account, but to that he took exception, and as a accounts." When the war started they received a demand for payment of the account, but to that he took exception, and as a patriotic Englishman, confided it to the waste-paper basket. They then had a letter from a debt collecting agency, but he gave instructions to his clerk to write across it "We object to pay, because we are patriotic. The goods were made in Germany, and I do not intend to pay unless the Registrar says we shall." They had been in business for 14 years, and they were one of the best firms, he supposed, in London. That was the first summons they

had been served with. He had had the bonour of sending seven men to Kitchener's Army. The Assistant Registrar: Life is short. We do not want a long address upon patriotism. You admit you have had these goods. The defendant: I do. The Assistant Registrar: Pay in 14 days. The Defendant: German made, Sir.

The Trade War.—The campaign which is being carried on in the Erening News against Germany's trade, on Monday dealt with "British Enterprise in Electrical Trades." The article contains a proportion of truth, but is, in the main, so ill-informed and inaccurate, that it is liable to produce very erroneous impressions on the mind of a layman. In particular, the statements which it makes regarding the private telephone manufacturing business are utterly nonsensical. The public are informed that before the war all the British private telephone companies bought their telephones from the Germans, but that two mouths after the war broke out a British engineer established "a factory where all the instruments required for the private telephone companies in this country could be manufactured." This piece of British enterprise is described as "distinctly encouraging." The author of these wild statements appears to be unaware of the fact that there are at least eight large telephone factories in this country, most of which have been established for many years, and that these are capable of producing all the private telephones required for our needs. He goes on to say that the same thing may be said in regard to metallic filament lamps, which can be obtained of British make, "at prices which compare most favourably with those formerly made in Germany." The prices are exactly the same as before the war, and the lamps have been manufactured in this country on a very large scale almost from the commencement. In justice we must commend the last three paragraphs of the article in which the The Trade War.—The campaign which is being carried cale almost from the commencement. In justice we must commend the last three paragraphs of the article, in which the writer points out that an enormous amount of the ratepayers' money has been paid for German electrical goods, which ought to have gone into the pockets of British workmen.

Of course, our readers know all about these facts, but it is a with the general public should be middled by the delia.

pity that the general public should be misled by the daily Press.

Blackpool Traders' Exhibition.—The electricity and tramways department took a very prominent position at the Exhibition which was held last month, and erected a very fine stand for the display of electric heating and cooking apparatus; the exhibit of electric light fittings was left to the electrical contractors, and five of the principal contractors in the town had stands close to what was known as the Corporation Electricity Bureau. The display of up-to-date electric cookers and fires was a very large one, most of the principal electrical manufacturers' products being shown. products being shown.

products being shown.

The Corporation also conducted demonstrations and lectures twice daily, and the skilled operations of Mrs. Mole, M.C.A. (Gold Medallist) Principal, Eustace Miles School of Cookery, London, attracted large crowds; it is hoped that the result will be that many of the existing consumers will adopt the Corporation's new rateable value tariff of $\frac{1}{2}$ 1. per unit. The total number of electric cookers and ovens on exhibition was 18, and there were no fewer than 108 electric fires. A considerable amount of literature was distributed and the electricity department soon felt the benefit from tributed, and the electricity department soon felt the benefit from

tributed, and the electricity department soon felt the benefit from the Exhibition, as the contractors installed during the past month something like 100 electric fires in the residences of consumers.

It is a settled policy on the part of the British Commercial Gas Association to introduce, on every occasion where possible, a counter-attraction to that of the electricity undertaking. This was obvious from the display which the gas department and the ironmongers in the town made at the Blackpool Exhibition, for some 56 gas ovens and 68 gas fires were exhibited. Steps were also taken to counteract the publicity campaign of the electricity department in the local Press; the latter department has for some time adopted a policy of this character, with the result that the revenue has gone up at the rate of £1,000 per quarter. The importance of carrying on an effective propaganda of this kind can hardy be over-estimated; the British Gas Association has set an admirable example, and it is most desirable that the electricity supply industry should co-operate on similar lines, and carry the supply industry should co-operate on similar lines, and carry the

supply industry should co-operate on similar lines, and carry the war into the enemy's camp.

The activity of the gas department in challenging on every possible occasion the propaganda of the electricity supply is shown by the following incident:—Some months ago, Mr. Charles Furness, the borough electrical engineer, advocated in Committee the desirability of opening a showroom in a central part of the town for the display of electric heating and cooking apparatus, but without any intention whatever of selling direct to the consumer. His reason for this recommendation was that whereas every ironmonger in the town was an indirect agent for the gas department and displayed gas cooking apparatus for the information of the consumer, the electrical contractor in Blackpool was generally content with an office and had no facilities for the display of electric heating and cooking apparatus. The recommendation was adopted by the Committee, but immediately it was known tion was adopted by the Committee, but immediately it was known that this department had taken a shop for the purpose of a show-room, the gas department came along with a similar resolution for premises adjacent to the electricity showroom.

To this Mr. Furness had no objection whatever, but when the matter came before the Council, both the resolutions were rescinded. There is no proof that the rescission was engineered by the local gas interests, but upon the face of things it looks suspicious.

The showroom scheme having been defeated, the only alternative for the electricity department is to be represented on every occasion in the local exhibitions, and to distribute in literature and publicity matter, at least what would have been spent in rent for the showroom.

Appointments Vacant.—Wireless telegraph operator (£250), for Government of St. Lucia; junior engineer-in-charge (£250), for Government of St. Lucia; junior engineer-in-charge (£91); switchboard attendant (30s.), temporary, for Newport electricity department; switchboard attendant (30s.), for Plymouth electricity works; power station superintendent, over 25, for Maidenhead electricity works; shift engineer (£104) for Birmingham electric supply department; traffic superintendent (£150) for Darlington Corporation; mains assistant and shift engineer (35s.) for Redcliffe U.D.C.; chief assistant (£117), also shift engineer, for King's Lynn electricity works; junior shift engineer (30s), for Luton electricity works. Particulars are given in our advertisement pages to-day. advertisement pages to-day.

Radium Hospital.—The new radium laboratories of Manchester Infirmary, which contain radium of the value of £20,000, were formally opened last week by the Lord Mayor.

-A correspondent wishes to meet with a firm selling high-class second-hand electric light fittings.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL BRVIEW posted as to their movements.

Central Station Officials.—The Dublin Corporation, on Monday, appointed MR. EUGENE ALLAN, son of Mr. Fred. Allan, secretary of the Council's Electricity Committee, to the Allan, secretary of the Council's Electricity Committee, to the position of superintendent of public lighting, city gas examiner and official meter tester, at a salary of £200 per annum, rising by annual increments of £20 to £300. Mr. Mark Ruddle, city electrical engineer, had reported that Mr. Allan's testimonials showed him to be well qualified for both gas and electrical sections. Mr. Allan secured 43 votes against 19 given for the next candidate. A motion to have the position re-advertised on the ground that the letter describing the qualifications of the 10 candidates that the letter describing the qualifications of the 10 candidates assured the Council that nine were not qualified, was rejected by 54 votes to 13, and a further motion for the rejection of Mr. Ruddle's report was defeated by 41 votes to 17.

MR. A. J. BECKETT, borough electrical engineer at Bridlington, has received a commission in the engineering branch of H.M. service. The T.C. has granted him leave of absence, and n.m. service. The T.C. has granted him leave or accence, and appointed MR. F. FFRENCH as deputy electrical engineer.

MR. H. G. WRIGHT has been appointed temporary assistant

mains engineer at the Dover electricity works.

MR. J. COLLINGE has been appointed to the position of station superintendent at the Salford electricity works at his present salary. Will Mr. WILLIAM ROZE, recently junior engineer-in-charge in the Belfast Corporation electricity department, communicate with Mr. A. Nichols Moore, borough electrical engineer, Town Hall, Newport, Mon. ?

MR. A. HELLEWELL, of Govan, has been appointed shift engineer at the Eccles electricity works. MR KING, of Newcastleon Tyne, has been appointed temporary shift engineer.

General.—The marriage took place at the Parish Church, Knaresborough (Yorks.), on December 29th, of Mr. ABTHUB B. FARRAR, of the firm of Farrar & Co., electrical engineers, of Bradford, and Miss Fearnside, elder daughter of Mr.

Fearnside, of Yorke House, Knaresborough.

MR. OSBORNE, assistant telegraph superintendent for the Ton-

MR. OSBORNE, assistant telegraph superintendent for the Tonbridge Postal District, who has retired after 50 years' service, has been presented by the staff with a gold watch.

MR. H. FOUNTAIN, C.M.G., has been appointed Assistant Secretary to the Commercial Department of the Board of Trade, in the place of Mr. G. J. Stanley, C.B., C.M.G., retired. Mr. Stanley continues to assist the Board in an advisory capacity.

The Times states that the marriage of MR. O. W. F. Lodge, eldest son of Sir Oliver Lodge, to Winifred, only daughter of Dr. W. N. Atkinson, H.M. Inspector of Mines, took place on December 31st at St. John's, Cardiff.

31st at St. John's, Cardiff.

MB. C. F. MACKNESS has resigned the appointment which he has held for the last 11 years as manager of the London cffice of the A.E.G. Electrical Co. of South Africa, Ltd. (late agents for the A.E.G. of Berlin, Foreign Department), and has joined the staff of Messrs. Vickers, Ltd., London, as assistant in mager of the electrical department, as from the 1st inst.

We tender our congratulations to Mr. John Cowan, the founder

of the Stirling Boiler Co. in this country, and who has been its chairman since its inception, upon the honour of Knighthood, conferred upon him in the New Year's List. MR. E. G. CONSTAN-

TINE, who has been associated with the company for many years, has retired from active business and resigned his position as managing director, remaining, however, a director of the company. He is succeeded in the management by Mr. H. J. S. MACKAY.

Mr. H. L. Ainsworth has resigned his position as head representative to Messrs. J. & H. Grevener, of London, and has joined the British Thomson-Houston Co., Ltd., as represents ive for London to their wiring amplies department. to their wiring supplies department.

Obituary.—We regret to learn that MR. GEORGE STEGMAN, principal in the firm of Stegman & Co., Clapham

Junction, passed away on Tuesday, December 22nd, after a long and severe illness. The business will be carried on as usual.

The sudden death of Mr. John Houson, engineer, Methil, who had been in charge since the opening of Methil Dock, of the power department, is reported.

NEW COMPANIES REGISTERED.

Pullan Engineering Co., Ltd. (138,851).—This company was registered on January 1st, with a capital of \$3,000 in \$1 shares, to take over the business of an electrical engineer and merchant carried on by C. Pullan at 80, King's Arcade, Bradford. The subscribers (with one share each) are: G. Pullan, 80, King's Arcade, Bradford, electrical engineer C. H. Best, 72, Market Street, Bradford, incorporated accountant. Private company. The number of directors is not to be more than five; the first are C. Pullan, H. Best, V. Learoyd, and W. Myers. Qualification, 25 ordinary shares. Remuneration as fixed by the company. Registered office: 80, King's Arcade, Bradford.

B. T. Gardner and Co., Ltd. (138,839).—This company was registered on January 1st, with a capital of £1,000 in £1 shares, to take over the business of electrical engineers and contractors carried on by B. T. Gardner & Co. at 6, Fox Court, Holborn, W.C., and to adopt an agreement with B. T. Gardner. The subscribers are: B. T. Gardner, 44, Royston Avenue, South Chingford, electrical engineer, 5 shares; H. Boocock, 23, Bryanstone Road, Crouch End, N., shopfitter, 10 shares; D. J. Gaillard, 50, Crookham Road, Parsons Green, S.W., electrical engineer, 5 shares. Private company. The number of directors is not to be less than two or more than five; the first are B. T. Gardner, H. Boocock and D. J. Gaillard. Solicitors, Needham & Barrow, 34, Essex Street, Strand, W.C. Registered office: 6, Fox Court, Gray's Inn Road, W.C.

Devon and Cornwall Acetylene Co., Ltd. (138,842).—This company was registered on January 1st, with a capital of 500 in £1 shares, to experiment with and exploit any chemical and electro-chemical processes, to manufacture and deal in carbide of calcium, ferro-alloys, oxygen and similar products, to carry on business as electricians, manufacturers of electrical and mechanical plant, etc. The subscribers (with one share each) are: C. Bingham, 11, Queen Victoria Street, E.C., merchant; A. S. Young, 11, Queen Victoria Street, E.C., merchant even; the subscribers are to appoint the first. No qualification necessary. Remuneration as fixed by the company. Registered office: 223, Mansion House Chambers, 11, Queen Victoria Street, E.C.

Strand Electric Supply Co., Ltd. (138,813).—This company was registered on December 30th, with a capital of £6,000 in 400 cumulative preference shares of £5 each, 1,500 preferred ordinary and 2,500 ordinary shares of £1 each, to carry on the business of an electric lighting and power company in all its branches. The subscribers (with 50 shares each) are: A. A. Douglas, Brandon, Colwyn Bay, manufacturer; J. Herbert Edwards, Haresfield, Stonehouse, Glos., engineer. Private company. J. Herbert Edwards is the first managing director. Qualification, 50 shares. Solicitors, Seymour Williams & Co., 38, Parliament Street, Westminster.

Electro Galvanizers, Ltd. (138,767).—This company was registered on December 24th, with a capital of £20,000 in £1 shares (12,000 first pref., 5,000 second pref., and 3,000 ord.), to carry on the business of engineers and contractors, galvanisers, inlayers of metals, electro-platters of metals and other substances, metallurgists, metal workers, electro-chemists, etc., and to adopt an agreement with W. G. Elliott. The subscribers (with one share each) are: H. E. G. Jarvis, 25, Ely Place, Holborn Circus, E.C., articled clerk; H. Handley, 4, Cromwell Road, Walthamstow, clerk. Private company. The number of directors is not to be less than two nor more than five; the first are D. Livingston and W. G. Elliott (both permanent). Qualification, 100 shares. Remuneration (except managing director), £100 each per annum and a percentage of the profits.

Wadebridge and District Electric Supply Co., Ltd. (138.776).—This company was registered on December 24th, with a capital of £3.450 in £1 shares (1,250 six per cent. pref.), to carry on the business of electric light and power producers and suppliers, gasworks owners, electrical engineers, supply agents for electrical goods, etc., and to enter into an agreement with C. D. Minns, of Obnassi, Gold Coast Colony, West Africa. The subscribers (with one share each) are: C. E. Hannoford, The Cottage, Felbridge, East Grinstead, artist; A. Wright, Station Road, Sidcup, Kent, electrical engineer; W. Phillips, Court Place, Wadebridge, Cornwall, land owner Private company. The number of directors is not to be less than two or more than five; the first are C. E. Hannaford, A. Wright, and W. Phillips, Qualification, 50 shares. Registered office: 1, Flora Place, Wadebridge, Cornwall.

Bedale and District Electric Supply Co., Ltd. (138,794).—
This company was registered on December 29th, with a capital of £3,000 in £1 shares (2,000 pref.), to carry on at Bedale, Yorks, or elsewhere in the United Kingdom, the business of proprietors of an electric light undertaking. The subscribers (with one share each) are: C. H. Best, 72, Market Serect, Bradford, incorporated accountant; R. W. Smith, 4, The Villas, Bedale, electrical engineer; W. Metcalfe, Elmwood House, Leeming Bridge, Bedale, Private company. The number of directors is not to be less than two or more than five; the subscribers are to appoint the first. The holders of the pref. shares have the right to appoint two directors, except when the total number in office does not exceed three, when one shall suffice to represent such shareholders. Qualification, £25. Remuneration as fixed by the company. Registered office: 72, Market Street, Bradford.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Telephone Development Co. (1912), Ltd. (121,272).—Capital £250,000 in £5 shares. Return dated July 24th, 1914. 44,540 share taken up; paid £222,700. Mortgages and charges, nil.

Universal Electric Contracts, Ltd.—Mortgage debenture, dated 19th December, 1914, to secure £600, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: G. E. Corfield, Balfour House, Finsbury Pavement, E.C.

Rhondda Tramways Co., Ltd.—A memorandum of satisfaction to the extent of £2.500 on various dates from 16th April to 22nd Dec., 1914, of charges dated 24th March, 1911, and 13th Nov., 1912, securing £240.000, has been filed.

North-Eastern Electric Smelting Co., Ltd.—A memorandum of satisfaction in full on 21st December, of mortgage debentures dated 17th August and 8th October, 1914, securing £500 and £130 respectively, has been filed.

Julius Sax and Co., Ltd.—Capital £18,000 in £1 shares. Return dated October 30th, 1914. All shares taken up; £12,005 paid; £5,995 considered as paid. Mortgages and charges, £2,500.

Stearn Electric Lamp Co., Ltd.—Capital £4,070 in £10 shares. Return dated August 11th, 1914. All shares taken up; £70 paid; £4,000 considered as paid. Mortgages and charges, nil.

CITY NOTES.

The Siemens-Schuckert Group of Companies.

THE RHENISH-SCHUCKERT CO.

The directors of the Rhein Schuckert Gesellschaft fur Elektrische Industrie of Mannheim, as in the case of certain other companies, report that the balance-sheet for 1913-14 has been carefully prepared, having regard to the present state of affairs. After setting aside £25,000, as in 1912-13, as reserve fund for investments, and making other appropriations, the accounts show net profits of £56,000, as compared with the same amount in the preceding year. The dividend proposed is at the rate of 5 per cent. on share capital of £400,000 and at 21 per cent. on new capital of £1,500,000; the sum of £10,000 has been placed to the extraordinary reserve fund, as in 1912-13, and £5,000 to the pension fund, leaving £18,000 to be carried forward, as against £17,000 in the previous year. Besides being interested in a number of undertakings, the company carries out constructional work, and the directors state that they hope to be able to continue this work with the diminished staff now available.

THE SCHUCKERT ELECTRICITY Co.

The report of the Elektrizitats A.G. vorm. Schuckert Co., which has been merely an investment company for some years past, and which is joint proprietor with the Siemens and Halske Co. in the Siemens-Schuckert Works, states that the company's own undertakings and those in which it is also financially interested experienced satisfactory results in the year ended with July 31st, 1914. The general backward movement in trade which had been occasioned by the warlike complications in the Balkans had reached a standstill, and the directors therefore would have proposed a dividend of at least the same amount as in 1912-13 if a new situation had not least the same amount as in 1912-13 it a new situation had not been created by the outbreak of the world-war at the beginning of the new financial year. Having regard, however, to the state of war, they had estimated the assets in a particularly careful manner and recommended a dividend of 6½ per cent. as compared with 8 per cent. in the previous year. The report proceeds to state that the influence of the war would naturally also be felt in connection with the company's undertakings in the present financial year. It had been possible everywhere to maintain the working and to continue the execution of extensions of supply stations, especially as a greater demand for maintain the working and to continue the execution of extensions of supply stations, especially as a greater demand for electrical energy was being manifested in order to economise the stocks of petroleum. The company had participated in the formation of the Nuremberg War Credit Bank, in the subscription to the National War Loan, and in various benevolent funds in connection with the war, and had made provision for the families of employés who had been called to the colours. After giving details of the manufacturing and other investments in different countries, the report sets forth the following figures: the following figures:-

	1913-14.	1912-13.
Share capital	£3,500,000	£3,500,000

Carried forward	66,000	63,000
ens.		•

The reserve fund is returned at £485,000 and the special reserve fund at £50,000. The holding in the Siemens-Schuckert Works remains at £2,247,500 for the ordinary capital and at £1,250,000 for the perpetual 61 per cent. loan advanced by the two proprietary companies.

THE SIEMENS & HALSKE CO.

The Siemens & Halske Co.

The report of Siemens und Halske A.G. for the year ended on July 31st, 1914, states that the year terminated on the eve of mobilisation, and the working results, therefore, were not directly affected by the influence of the war. In general, the year had the character of increasing improvement. But, on the other hand, the accompanying phenomena of the war which had arisen in the meantime and the unknown developments of the future rendered necessary a specially careful examination of the list of assets in the balance-sheet. It had been emphasised for years past that particular care had been emphasised for years past that particular care had been emphasised for years past that particular care had been taken in this direction, but for the past year the company went beyond the usual measure, and also proposed to reduce the dividend from 12 to 10 per cent. In this way it was believed that the company would appropriately meet the various points of view which concerned the question of the computation of the dividend. The permanent investments in foreign companies, partly situated in hostile countries, stood in the books at amounts which also took into account the risks existing in time of war. It was obvious in a period of serious

economic convulsion like that caused by the war that the electrical industry was considerably involved, because its manufacturers were to a large extent of the kind through the employment of which greater perfection in economy was obtained, but in war time requirements of that nature were only on hand to a smaller degree. As a consequence, the orders received by the works for articles of peace in the new financial year were considerably below the average of the corresponding period in previous years. As, however, the company from the beginning had occupied itself very fully with the requirements of the Army and the Navy in the matter of electrical equipment, and had participated in the development of new branches, an assured compensation was offered in the new spheres of work for the slacker activity in peace manufactures. In addition, the plant had been accommodated as much as possible to further military needs and had been placed at disposal. At the time of the report being printed the staff of the firm and of the Siemens-Schuckert Works had contributed to the colours 3,588 officials and 9,938 workmen, or a total of 13,526 men. The directors expressed the belief that they might abstain on the present occasion from reporting on the technical development which had taken place, except to mention that it had proceeded systematically in the arms of the present occasion that the present occasion that the present occasion that the proceeded systematically in the present occasion that the proceeded systematically in the present occasion that the present occa economic convulsion like that caused by the war that the place, except to mention that it had proceeded systematically in the usual manner and been successful. The accounts are given below:-

,	1913-14.	1912-13.
Ordinary share capital	 £3,150,000	£3,150,000
Loans	 2,216,000	2,242,000

Dividend, per cent	 10	12
Carried forward	 60,000	60,000

SIEMENS-SCHUCKERT WORKS.

The directors report that the year 1913-14 developed better than might have been expected from the indications of a general decline in trade prosperity, and consequently the orders received were not inferior to those of the preceding year. During the twelve months the German works delivered 128,267 machines, motors and transformers of a total of 2,849,582 kw., as compared with 132,800 and 2,990,000 kw. in the previous year respectively. The time following the day of mobilisation on August 1st at first brought about stagnation in the course on August 1st at first brought about stagnation in the course of economic activity, and in the early days of that month 1,602 officials and 6,081 workmen were called up, the number rising to 2,327 and 7,102 respectively by the middle of November. At present the staff corresponded with the extent of the orders received in consequence of the increased employment for the requirements of the Army and Navy. The company, in conjunction with the Siemens & Halske Co., participated with corresponding amounts in the War Credit Bank of Greater Berlin as well as in the Nuremberg War Credit Bank in association with the Electricity Co. (late Schuckert) of Nuremberg, and also in the War Metal Co. and other undertakings of public utility in accordance with the circumstances of the times. The utility in accordance with the circumstances of the times. active trade with the company's friendly houses in England, France and Russia had naturally been tied up through the war. Oversea trade, which had been of considerable extent, was also very difficult, but the directors ventured to have confidence that the victorious termination of the war would lead to increased prosperity in this branch of business activity. It was obvious that prudence rendered necessary a specially cautious calculation of the balance-sheet, which was possible thanks to the favourable results for the year. The accounts exhibit the following figures:—

	1913-14.	1912-13.
Ordinary capital	£4,500,000	£4,500,000
Loans (obligations)	3,877,000	3,905,000
Perpetual 61 per cent. Loan	2,500,000	2,500,000
Gross profits	1,063,000	1,167,000
General expenses	94,000	94,000
Interest on loans	337,000	333,000
Depreciation	74,000	\sim 62,000
Net profits and balance forward	574,000	692,000
Allocation to reserve fund	125,000	125,000
Bonuses to staff and workmen	75,000	75,000
Provident fund	25,000	25,000
Profit share of the two proprietary		
firms	337,000	450,000
Percentage of profit distribution	$7\frac{1}{3}$	10
Carried forward	12,000	17,000

During the year the company's technical work showed quiet but constant development. In particular, attention was paid to the improvement of the methods of working, to reconstructions which were shown to be requisite in consequence of the new regulations of the Union of Electrical Engineers, and to the standardising and development of the branches which aim at the protection of electrical installations in connection with the increasing ampleyment of hightions in connection with the increasing employment of high-tension currents. The company's activity for the mining tension currents.

industry, which was in a difficult situation, especially in ragard to the potash industry, experienced an increase through the large advance in orders for winding engines for abroad, and the foreign orders for the iron industry also provided as great employment as in the previous year. No material change occurred in all other industries as contrasted with 1912-13. The extension of existing overland stations and the detablishment of new works continued to follow an active course. As a matter of technical interest, the report mentions the central station at Zug, Saxony, which utilises water power and is situated at a depth of 1,000 ft. in a disused mine, the output being 2,400 kw. The experimental installations in progress for various administrations in regard to main line, city and suburban railways, were approaching completion. The trial runs on the main electric line between Kiruna and Riksgränsen in Sweden had begun, the railway being intended for the working for the first time in Europe of goods trains of over 2,000 tons, for the transport of iron ore. Owing to the war it was impossible to bring into operation by the pre-arranged time the almost completed sections between Halle, Leipsic and Bitterfeld and the Silesian mountain section between Laubau and Konigszelt, together with the auxiliary sections. In the case of South German lines, sections had been brought into operation with direct current at 1,200 volts with good success. The transmarine business was in a state of depression during the year in consequence of a reduced influx of European capital, disturbed political conditions, economic failures in regard to finance, unfavourable harvests, and the course of prices for important export commodities. As further technical progress are cited the facts that the large three-phase transformers, each of 23,000 kw., ordered in 1912-13, for 25,000 volts had well stood the test in working, and a similar remark was applicable to the Lauchhammer station, which was working at 110,000 volts. Other installations for t

Tata Hydro-Electric Supply Co., Ltd.—It appears from the recently issued fifth report that the whole of the company's available supply of power has been already disposed of, and that 35 cotton and three flour mills have contracted for such supply for a period of 10 years. The report gives a very satisfactory account of the progress of the work. The dam and other works of the Lonavla Lake are sufficiently forward for practically full storage and use, and the same, to all intents and purposes, may be said of the Walwhan Lake dam. The duct from Lonavla Junction to the forebay is sufficiently advanced to carry 3 ft. of water for beneficial use, and this water can be delivered as soon as the pressure pipe-line is completed. The Walwhan duct is not so far advanced, but the forebay dam and bed of the basin are sufficiently completed to enable the forebay to be filled to 10 ft. above the outlet level. The work on the pipe-line still appears to be the most backward, and in this respect very different to that in connection with the power house, where, it seems, power could be generated any time if water were available at the turbines. All the transformers required for the original installation are reported on the site. Complete motor equipments have been delivered for 19 mills, and partial deliveries have been made for several others. Work on cables, switchgear, meters, &c., is also well in hand. Thus it appears that there will be no difficulty in utilising current when once the supply begins.—Indiaman.

Nairobi Electric Power and Lighting Co., Ltd.—It is reported that the war has not yet affected adversely the company's working at Nairobi, and that there is no reason for nneasiness. The directors have, therefore, decided to make an immediate further distribution of profits by declaring a second interim dividend for the year 1914, making 6 per cent, now paid on both the preference and ordinary shares, and they hope that when the year's accounts are completed and audited, there may be sufficient profit shown to warrant a final substantial dividend in respect of the year's working.

Delabole Electric Lighting and Supply Co., Ltd.—The first annual meeting was held on December 31st, but no statement of accounts could be presented. Mr. M. J. Wills, the chairman, said that the secretary had been away serving his country, and the assistant secretary had been unwell. The meeting was adjourned to January 18th.

Mexican Electric Light and Tramway Companies.

—Owing to the continued unsatisfactory condition of affairs in Mexico, payment of the half-yearly coupon now due on the 6 per cent. 50-year mortgage bonds of the Mexican Tramways Co. is deferred, as is also payment of the half-yearly coupon of the 5 per cent, first mortgage gold bonds.

Calcutta Electric Supply Corporation, Ltd.—The number of units delivered to consumers during the five weeks ended October 30th, 1914, were 1,464,381 compared with 1,426,639 in the corresponding five weeks of 1913. For the four weeks ended November 27th the units delivered amounted to 988,840, compared with 965,848 in 1913.

City of London Electric Lighting Co., Ltd.—Warrants in payment of the half-year's interest to December 31st less income-tax at 1s, 10d. in the £ on the first and second debenture stocks, have been duly posted.

STOCKS AND SHARES.

Tuesday Evening.

THE Stock Exchange re-opened its doors last Monday, January 4th, for the first time since they were closed on Friday morning, July 81st, 1914. Notwithstanding the serious nature of the restrictions imposed by the Treasury as the price which the House has to pay for being allowed to conduct business within its own doors, members were unfeignedly glad to get back to their accustomed positions. Veterans who had not been seen in Throgmorton Street for many a year put in an appearance on this historic occasion. For the first time since Maurice Gifford and a party of Rhodesian Horse crossed the Kaffir Circus after the Boer War, men in khaki mingled with groups of their fellow-members who appeared in every-day clothes. The occasion tingled with keen excitement, suppressed nominally, but very apparent actually—to those who know the markets—in the high boisterousness of spirits which prevailed.

It might have been thought that members were returning to the

spirits which prevailed.

It might have been thought that members were returning to the pleasantest of business prospects, instead of coming back to chains and fetters provided by the Treasury for every bargain done. The fear is that alien enemies may take advantage of the Stock Exchange being officially open, and realise money which might be transmuted into guns and ammunition whereby the war might be lengthened and more lives sacrificed. The Treasury, moreover, views with lively apprehension the possibility of outside raids being organised against British credit, through the medium of bear operations in the Stock Exchange markets. These are the principal reasons why they have shackled Stock Exchange business with such impediments as to make House men despair of paying expenses for a long time to come, unless the conditions are modified.

The Stock Exchange sang the National Anthem with profound feeling and fervour; at the line "And make them fall," the domes reverberated with the force sung into the words. And when three rousing cheers were given for the King at the end of the brief ceremony, many members found themselves obliged to retire abruptly behind convenient pillars and telephone rooms, in order to swallow quite unusual sensations which persisted in arising in their throats.

Business is now on a purely investment basis. During those five months that lay between August and December, a certain amount of speculative buying and selling went on which now is no longer possible. The man who sells shares must, in giving the order, provide the name of the transferor and the distinctive numbers. The certificate must have been in physical possession within the United Kingdom for at least three months. The client, be he buyer or seller, has to sign a declaration to the effect that the transaction is not on behalf of an alien enemy, directly or indirectly. In exceptional cases, transactions may be carried through for clients outside the United Kingdom; but everything of this sort is subject to the keenest scrutiny, and must be submitted to the Stock Exchange Committee before it is allowed.

There should be now no difficulty experienced by the buyer in obtaining delivery of stock or shares, for the jobbers are precluded from selling short, even where they have the reasonable certainty of replacing stock at a profit. Every bargain has to be officially recorded, whether it be in quoted or unquoted securities. The Stock Exchange Official List has made its re-appearance in guise most

There should be now no difficulty experienced by the buyer in obtaining delivery of stock or shares, for the jobbers are precluded from selling short, even where they have the reasonable certainty of replacing stock at a profit. Every bargain has to be officially recorded, whether it be in quoted or unquoted securities. The Stock Exchange Official List has made its re-appearance in guise most unfamiliar. Not all markets, it should be added, are hampered by the imposition of a scale of minimun prices below which members are not allowed to deal. So far as the electrical issues are concerned, this restriction applies only to certain securities in the Home Railway lists. The Treasury, however, retains the right to extend the principle of medium prices as and when it considers such conditions needful.

Those clients who find such bars to business to be irksome and cumbrous will be the more ready to sympathise with the Stock Exchange broker who is obliged to deal only in this way, because of the Treasury requirements. The prophetic optimist foresees early modification of the restrictions, though the paternity of the wish renders it suspect.

The Metropolitan Railway issue of 5 per cent. Preference stock failed to achieve the same measure of success as attended those previously made by the London and South-Western and the South-Eastern Companies. The security was regarded as somewhat least attractive than that offered by the other two railways; whereas premiums are established in the case of the latter stocks, the new Metropolitan Preference stands at a discount of about 1½ per cent.

Hetropolitan Freierence stands at a discount of about 12 per cens.

Home Railway stocks, as a whole, are not at all bad expectation looking for maintenance of much the same dividends as those which were paid a year ago. The Underground group, however, is exceptional, and prices are heavy. It will be observed from the

following list that small falls have taken place this week in three or four cases. We have added to our usual prices another column showing the levels at the end of July, when the Stock Exchange closed :

100j 38j The Calcutta Electric Supply Corporation is offering its share-The Calcutta Electric Supply Corporation is effering its share-holders new Ordinary shares at 5½ and new Preference at 5. Application must be made for an equal number of both classes of shares. At the end of last July the offer would have been a very tempting one, because Calcutta Ordinary were standing at 7½ and the Preference at 5½. The war has brought prices down, and at the present time the nominal quotations are about 6 and 4½ respectively, or £10 15s. together, so there is not much plunder to be made by subscribing at £10 10s. for the two. Moreover, no Stock Exchange dealings are allowed in any new issue made after January 4th, 1915, unless specially allowed by the Committee and approved by the Treasury. The company, however, has a fine record from 1900 onwards, so proprietors will probably take up their new shares as good investments. Manufacturing issues are fairly steady, though Westinghouse Preference and Telegraph Constructions show falls on the week. Edison & Swan partly-paid shares are 1s. higher at 13s., and have been up to 14s. That the Company is doing extremely well with its lamp business has been common knowledge for some time past, and rumour now has it that substantial contracts for work in connection with submarine have been recovered.

connection with submarines have been secured.

The Bill has been deposited for introduction into Parliament next session for constituting a company with powers to supply electrical energy in the County of London and adjacent areas. It is proposed to incorporate a company, with a share capital of six million pounds sterling, with borrowing powers of another two million pounds, and some see in this the possible advent of that Electric Supply Board—on the lines of the Metropolitan Water B ard—which has been the dream of many people for years. The electric lighting market exhibits no important changes on the electric lighting market exhibits no important changes on the week, but there may be significance in the renewed eagerness of the demand that is noticeable for all the best Debenture stocks in this group.

METAL MARKET.

Fluctuations in December.

Russia's Copper Production.—The output of copper in Russia has increased considerably in recent years, and if the rate of expansion which has taken place hitherto is maintained it would appear that the country will become independent of external supplies in the course of a few years, unless the demard increases in a greater ratio than the output. As the position is at present, the only material imported is said to be electrolytic copper, although the production of this quality was begun in Russia by the Rosenkrantz works in 1907, and was followed by the Kyshtym works in 1911. The development of the copper industry, as a whole, is illustrated by the fact that the imports declined from 20,300 tons in 1904 to 6,100 tons in 1913, whereas the native production increased by over three times in the same years to 34,300 tons in 1913. The Caucasus was responsible for 10,000 tons of the output in 1913, the Urals for 17,300 tons. Most of the copper producers formed themselves into a syndicate (Medj) in 1907, and the accession of new members raised the quantity controlled by the syndicate to 95'7 per cent. of the total production in Russia in 1913. The great development of the industry is attributed to the systematic management of the syndicate, whose prices, in contra-Russia's Copper Production.—The output of copper systematic management of the syndicate, whose prices, in contra-distinction to the South Russian Coal and Iron and Steel Syndicates, have apparently not formed the subject of Govern-ment complaints on the ground of being excessive.

Large Glass Switchboard .- Recent developments in the making, bevelling and drilling of massive slabs of glass have made it possible to utilise this substance in the construction of made it possible to utilise this substance in the construction of switchboards.. A glass switchboard built for Dodge Bros., Detroit, Mich., by the Mutual Electric and Machine Co., Wheeling, W. Va., is declared to be one of the largest switchboards of this type ever made. The board is of white Carrara glass, and is 1'5 in. thick. All instruments are finished in golden bronze to add to the pleasing appearance of the appearatus as a whole. The board is in the engine room, and is used only for control purposes. The generator and feeder switches are operated by solemoids and motors, and are on additional switchboards in the basement and other parts of the factory. Mounted on the switchboard is a set of remote-control field discharge switches and "I-T-E" motor-operated circuit-breakers. To the left and right of the control switches on the glass board are mounted red and green signal lamps. The board is used in connection with the control of two 480-volt, 750-kw. three-phase 60-cycle steam-turbine units, one 500-kw., three-phase 60-cycle steam-turbine units, one engine-driven exciter and two motor-generator exciter units.—Electrical World.

TRADE OF NEW ZEALAND.

The following remarks relative to the trade of New Zealand in 1913 and Great Britain's participation therein, are extracted from the recently-issued report to the Board of Trade by H.M. Trade Commissioner (Mr. W. G. Wickham). This report (Cd. 7,693) can be purchased from Messrs. Wyman & Sons, Ltd., price 2½d.

General Trading Position.—The year 1913 was remarkable in several respects. It was a year of high prices, and a year of record trade in nearly every country. The total imports and exports of New Zealand for 1912 and 1913 were as follows:

	1912.		1913.	Increase.
Imports Exports	 £20,977,000 £21,771,000	,	£22,286,000 £22,987,000	£1,309,000 £1,216,000

The above figures include bullion and specie exported and The above natures include builton and specie exported and imported, and it may be noted that, while the value of these latter exported has fallen by £82,600, the value imported was greater in 1913 by £234,675. The margin of gross exporte over imports is slightly reduced on the year, but if specie be left out of account it is greater, as appears below:-

1912. £20,576,500 21,511,600 935,100 1913 £21,652,000 22,810,000 Imports, excluding specie ,, 1,158,000 Excess of exports

The general boom in trade had its usual somewhat inconvenient corollaries, namely, dear money and slow delivery of goods. The effect of a tight money market has been natur-

Methods of Distribution.—Partly through the retailer wishing to get into closer touch with the manufacturer, with the idea that he would thereby save intermediate profits, and partly through the desire of the manufacturer to learn more directly what was wanted, and to exhibit his wares through an agent in personal touch with the consuming market, the an agent in personal touch with the consuming market, the middleman is being ousted and direct trading resorted to in

his place. This change has, so far as one can judge, come to stay. If it pays to sell through an agent in the, at present, limited or scattered market of New Zealand, it would appear

likely to pay better and better as the market grows.

The following are, roughly, the alternative methods of dealing with the Dominion of New Zealand:—

1. A manufacturer may sell only in the United Kingdom to warehousemen, indent agents, and buying agents of the large retailers.

2. He may even limit himself by confining sales for export to a single merchant house in the United Kingdom.
3. He may have a trading branch established in the

Dominion.

4. He may consider that a single agent for Australasia (i.e., all the States of Australia, New Zealand and some of the Pacific Islands) is competent to find all the business he needs.

5. He may think it preferable to divide his business among

several agents to cover the different clearly-defined areas in

the Commonwealth and the Dominion.

The consensus of opinion appears to be against the first and second of these equally, except when the manufacturer is working on too small a scale to be able to do his own exporting economically. On the other hand, it is useless to add export to manufacturing unless firms are prepared to study the economics of the former as carefully as they do those of the latter. And further, it must be clearly understood that it is worse than useless to appoint a sole agent unless the manufacturer is satisfied that he is capable, as well as desirous,

of doing justice to the appointment; and in spite of the utmost loyalty of intention it is usually impossible to prevent goods reaching the Dominion by devious channels, and so seeming to go past the local agent.

The third alternative calls for no comment. The fourth is more open to argument. That it is a question of some importance is clear from the fact that there are some 700 British manufacturers who have a sole agent for Australasia located in Melbourne or Sydney, or in a few cases in some town in New Zealand. Expression is often given to the oning that New Zealand. Expression is often given to the opinion that manufacturers have done this owing to a deficient knowledge of elementary geography and history, as shown in the belief that New Zealand is a State in the Commonwealth. While that New Zealand is a State in the Commonwealth. While there may not be complete justification for this extreme view, it is true that the areas, the relative distances and consequent slowness of communication between parts of Australasia are not adequately realised. At the same time, it must be admitted that it is almost as difficult adequately to work Western Australia from Sydney as New Zealand. However this may be, there is no gainsaying the fact that many agencies granted for all Australasia are simply not worked so far as New Zealand is concerned: in other cases, again, the agent is content with one visit in two years, or with a pericylical visit to the Dominion, not stopping in any but the four chief to the Dominion, not stopping in any but the four chief

Need for Local Representation.—In the Trade Commissioner's view, it is thoroughly bad policy to have a single agent for Australasia, as in most cases it merely means either that the whole area is not effectively covered, or that the whole work is done by sub-agents, and the goods consequently loaded with an extra agency commission. In expressing this

loaded with an extra agency commission. In expressing this view, one class of goods must be excented, namely, goods which for effective sale need expert knowledge. If an agent having expert knowledge can be found in New Zealand, well and good: if not—and it is by no means easy always to find a firm of experts who are not already fully engaged with agencies—it is better to have local sub-agents who can keen a look-out for local business, and call in the expert head agent, say from Sydney, when expert knowledge is required. The class of goods referred to is, of course, machinery. It is annoying to a buyer, say the Engineer to a Harbour Board, to find the agent for an engine unable to discuss the technical resints in a suggested varietien from a standard model, and the local agent having instified his existence by getting into touch with possible business should be able to call in an expert head agent to clinch it. On the other hand, an expert head agent for the whole of Australasia cannot possibly keep himself informed as to all the possible business over such a vast area, or afford time to follow up single-handed all the possible business of which he does hear. Further, the expert possible business of which he does hear. Further, the expert can post up the non-expert sub-agents as to selling points of his plant, and he can also watch the local conditions and keen the manufacturers advised as to medifications necessary to suit these conditions.

It may here be pointed out that business of this kind must It may here be pointed out that business of this kind must be regarded as speculative as compared with the sale, say, of hardware and creckery, where a regular beat can be cannessed by journeys at regular intervals. In the sale of his plant, e.g., crane installations or large engines, much time and expense must of necessity be wasted over business which does not materialise. Manufacturers must realise this in making terms with agents, and they should also endeavour to understand the local conditions as regards distances, from the consequent expenditure of money and time involved. and the consequent expenditure of money and time involved in endervouring to secure orders.

The Trend of Import Trade.-The New Zealand Import Returns are based for the most part on the country from which goods were last invoiced, which may not be the country where they were manufactured. Only in the case of goods coming in under the preferential tariff is the country of origin reliably

stated. Consequently the comparative figures which we give elsewhere in this issue must be taken merely as a general guide to the trend of the trade. The following remarks by the Trade Commissioner, however, refer to goods which are affected by the preferential tariff and whose real origin is therefore

The statistics on the whole represent a very distinct improvement, but in a few lines there is an unsatisfactory loss of trade. The most noticeable item is hardware and hollowof trade. The most noticeable item is hardware and hollowware. Tinware also shows disappointing figures. Another heading where the United Kingdom's share is poor is "Metal, manufactured goods unenumerated." In the two last-named categories, Germany lost ground as well as Great Britain, the United States being the country which improved its

In portable and traction engines, we find a somewhat disconcerting transference of trade in a peculiarly British line. A severe drop in the share of the United Kingdom is accompanied by a strengthening of the United States' position.

There was a considerable drop in imports of gas-making plant and pumps and mining machinery, but these lines depend rather on chance orders, and a small import one year may be followed by a large one the following year. Cement is being satisfactorily manufactured locally, which accounts for a drop in imports having taken place in spite of the increasing demand for reinforced concrete.

In steam engines, other than locomotive, portable, and traction, the very heavy fall is difficult to explain. The increase in gas and oil engines was less than half of this fall, and the only explanation seems to be that tightness of money during the year has caused a check in industrial expansion needing steam engines as prime movers. No ground, however, has been lost in proportion to relative sources of supply.

supply.

A year ago attention was called to the extent of foreign competition in lamps, especially from Germany and America. In 1913, however, both of these countries lost ground, and, in spite of a slight reduction in total imports, the United Kingdom has improved her position.

The above remarks refer to important lines where the total trade of the year has shrunk. Turning now to those where there has been expansion, and especially lines where the proportion from the United Kingdom has improved, there is a good deal that is noteworthy under iron and steel manufactures. In such lines there is very little competition with the United Kingdom, partly, no doubt, because the very considerable extra duties on foreign goods cause the inferior Belgian and German makes to cost as much as better British qualities, and so take away the only inducement to buy them.

and German makes to cost as much as better British qualities, and so take away the only inducement to buy them.

Canadian competition in drawn steel pipes and tubes has been maintained. Imports of wire rope increased considerably. In nails we have less than half the trade, but have slightly improved our position. British wire appears to be tougher than foreign and so better for tensile purposes; but for nail making the harder and more brittle German and American wire would seem to be better liked.

In the machinery group there is no sensational change. Gas and oil engines again increased by £10,000. Imports of belting other than leather have increased to £40,000, and the proportion from the United Kingdom has advanced from 75 per cent. to 85 per cent. at the expense of Japan and Germany. The former is the chief competitor.

In connection with the growing trade between New Zealand

many. The former is the chief competitor.

In connection with the growing trade between New Zealand and the North-American Continent, it is interesting to note the increasing freight facilities for this interchange. As bearing out comments previously made on the operation of the preferential tariff in indirectly assisting the United States in competition with the United Kingdom, it may be of interest to quote the stutement, to which considerable publicity has been given in the New Zealand press, of an ex-Governor of Massachusetts who is manager of a large American machinery manufacturing concern. He states that all over the United States "the tendency among the principal manufacturing concerns is towards the establishment of plants in facturing concerns is towards the establishment of plants in Canada." He adds that this movement has been going on for many years, and estimates that from three to five hundred million dollars of American capital is now invested in these Canadian plants.

The Electrical Industry in Italy.—From statistics recently published, brought up to the end of March, 1914, it appears that the Italian companies concerned in the production and distribution of electricity number 151, having 302 stations at work, with a production equal to 763,000 H.P., while nine stations are under construction, with a capacity of 125,000 H.P. The capital employed by these companies amounts to 453,000,000 lire; the reserve funds total 32,500,000 lire; debentures, 146,000 lire; debts, 265,000,000 lire: plant, 732,000 000 lire, and securities and credits, 188,000 000 lire. Of these companies, 125 made profits and credits, 188,000 000 lire, 11 made a loss of 8,000,000 lire, and 15 succeeded in making a balance only. The data regarding firms engaged in the output of electrical machinery are as follows:—The number of such firms is 16, employing power to the extent of 3,310 H.P., a capital of 36,000 000 lire, with reserve funds of about 3,000,000 lire, debts of 46,000,000 lire, plant valued at 29,000,000 lire, stock to the value of 29,000,000 lire and securities and credit, 45,000,000 lire. The profits made by 14 of these concerns totalled 2,600,000 appears that the Italian companies concerned in the production The profits made by 14 of these concerns totalled 2,600,000 lire, while the remaining two made a loss.

THE BARTON POWER SCHEME OF THE MANCHESTER CORPORATION.

As many of our readers are aware the Manchester Corporation Bill, which received Parliamentary sanction last year, allows, amongst other things, of the Corporation proceeding

with an ambitious electrical scheme, which has become necessary owing to the rapid increase in the demand for electricity in Manchester area.

At the present time the city is supplied from three generating stations -Dickinson Street and Bloom Street stations, which direct supply current in the centre of the city. with a combined plant capacity of 14,000 kw., and Stuart Street station, in the Clayton district, which supplies alternating current at 6,600 volts pressure to nu merous anhstations, and has a plant capacity of 55,500 kw.

In connection with the Stuart Street station there are 22 sub-stations excluding those consumers ٥n premises - with an

To meet the requirements of the large power users, the Corporation has also equipped 58 sub-stations on consumers' premises, with an installed capacity of 34,500 kw.

MIDDLETON FAILSWORT SALFORD DAVYHULME DENTON SALE TIMPERLE PROPOSED GENERATING STATION CORPORATION SEWAGE WORKS PROPOSED DISTRIBUTING STATION

FIG. 1.—SHOWING THE MANCHESTER SUPPLY AREA IN RELATION TO THE PROPOSED BARTON GENERATING STATION.

[Supply area includes Middleton (bulk), Failsworth, Droylsden, Audenshaw, Denton, Heaton Norris, and (for traction) Sale, Timperley and Altrincham.] Existing generating stations shown as black spots, and sub-stations as rings.

installed capacity of 33,000 kw. One of these is at Dickinson Street, where the generating plant was unequal to meeting the demand for electricity in the adjoining area.

The area which supply powers held are now amounts to 46 sq. miles, with an estimated population of 750,000, exclusive of the Middleton area, to which a bulk supply is given.

The electrical demands of the area can be gathered from the fact that nearly 155 million units were generated and 118 million units sold during the year ending March 31st, 1914, and that the maximum demand about 50,000 kw. is increasing at the rate of some 5,000 KW. a year under normal con-All the ditions. existing stations are limited in capacity by reason of water facilities for condensing purposes, the existing and buildings at Stuart Street will be full up with an installed capacity of 60,000 kw., the adjoining

spare land being required for coal-storage purposes.

In view of the limitations mentioned, particularly as

regards the Stuart Street station, the effective capacity of

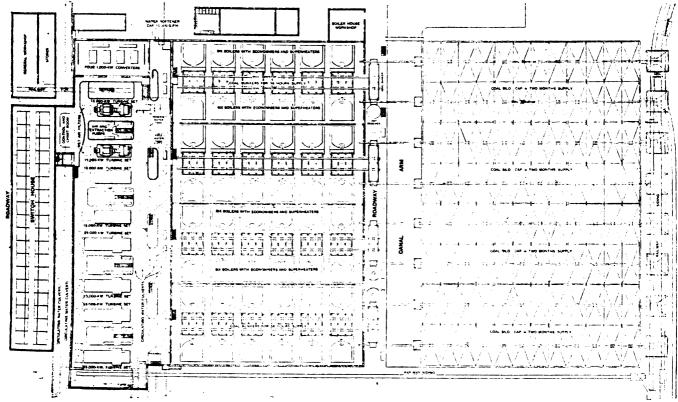

FIG. 2.—PLAN OF THE PROPOSED BARTON GENERATING STATION, MANCHESTER, COMPLETE WITH COAL SILOS, &C.

which for generating purposes will be reached when the maximum demand attains to $45,000 \, \mathrm{KW}$, allowing for reserve plant, it was decided that further generating plant in a fourth station should be available by the summer of 1917.

With this object in view numerous sites were inspected by the representatives of the Corporation, who were faced with a problem considerably in advance of anything yet attempted in the way of municipal electricity supply, as the projected ultimate capacity of the new station will be some 160,000 kw.

The site actually selected for what is now known as the Barton generating station covers 12 acres, and is situated at the extreme western end of Trafford Park, on the side of the Bridgewater Canal, and in the parish of Davyhulme.

canal can handle at least 1,000 tons a day, while over the Trafford Park railways 300 tons of coal an hour can be handled, sidings being provided for its reception.

The coal silos, to which reference has been made, will hold a two months' supply of fuel; each silo will be equipped with two endless bucket type conveyors into which rail-borne coal can be fed through hoppers below rail level, situated at one end of the silo, while water-borne coal received in the dock will be fed into hoppers at the other end. For this purpose the dock between the boiler house and silos, which will be roofed in, will be provided with a travelling crane with a bucket or grab for removing coal from the barges. Each silo conveyor will run across the dock and empty into an elevated coal hopper at the end

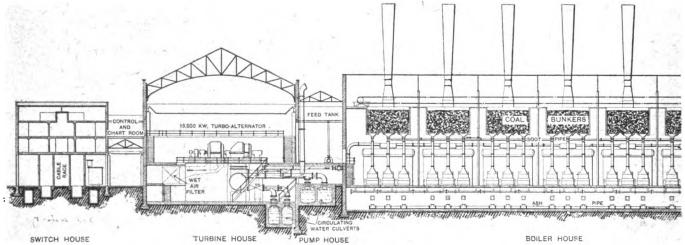

FIG. 3.—SECTIONAL ELEVATION THROUGH SWITCH, TURBINE AND BOILER HOUSES, AND COAL SILOS OF THE PROPOSED

This site fulfills the necessary conditions as to fuel, water, length of transmission lines and foundations, as by means of the Bridgewater Canal the West Lancashire coalfields are easily accessible, being only four miles away, while the Trafford Park railways provide through communication with the English coalfields generally. In the matter of water for condensing purposes, the site is also convenient to the Manchester Ship Canal. As, however, the consent of the Canal Co. to the use of the water is at present withheld, it is proposed to use the sewage and subsoil water—in the form of a purified effluent—which passes down the main outfall sewers to the Corporation's sewage works at Davyhulme, situated some 1,400 yards from the Barton site. The Barton site is about five miles from the centre of the city, being actually nearer than an alternative site within the city area, which met with some favour; trial borings have also shown as regards foundations that red sandstone rock underlies the whole of the site at a depth ranging from 7 to 8 ft., and, further, there are good grounds for considering that at least 1½ million gallons of good quality water can be pumped from boreholes in this rock every 24 hours.

It will be necessary to construct a new bridge across the Bridgewater Canal to carry coal and railway traffic to the station

The preliminary plans of the generating station, which we are able to reproduce, show that not only will it be the largest power station in the kingdom, so far actually projected, but that it will be essentially a "big unit" station.

It is proposed to erect it in four sections, each of which will contain two complete steam-raising, electrical-generating and auxiliary plants, thus providing eight complete plants in the station. This allows of one spare plant, one set aside for repairs, and six plants in commission. As proposed the first four generating units will be turbine sets of 15,000 kw. each, and the remaining four, similar sets of 25,000 kw. each, making a total of 160,000 kw.

The arrangement includes four boiler houses, each with two batteries of water-tube boilers facing on to a central firing floor, i.e., one battery of boilers for each turbine set, and four coal silos practically forming extensions of the boiler houses, but separated from the latter by a canal dock for the reception of water-borne coal.

Preliminary estimates show that 500,000 tons of coal per annum will be required by the complete plant and the of the adjacent boiler house, returning through a tunnel under the dock and silos.

The elevated coal hopper in turn will feed two endless bucket conveyors situated (both lead and return) over the bunkers in the adjacent boiler house, which are designed to carry 36 hours' fuel supply.

Only one section of the station, viz., 30,000 kw. of plant, is contemplated in the first instance, and 10 water-tube boilers, each with a normal rating of 50,000 lb. steam per hour, and complete with its own superheater, economiser, induced-draught plant and chimney – the Prat system being proposed in regard to the latter.

The suction ash system is proposed for the removal of the ashes and soot, the pipe systems leading to receivers on the canal dock side, which will discharge into barges, and to other receivers at the end of the coal silos, which discharge into railway trucks.

The first section of the generating plant will consist of two 15,000-kw. turbo-alternators generating three-phase current at 6,600 volts, 50 cycles, with a speed of 1,500 R.P.M., and developing their normal output at '85 power factor.

A generating unit of this size has been in use at the Stuart Street station for some time, and was described and illustrated in the ELECTRICAL REVIEW of July 3rd, 1914.

The main cables from the generators will run direct to step-up transformers for raising the transmission pressure to 33,000 volts. These transformers and the necessary E.H.T. switchgear will be housed in a separate fire-proof switch-house; the switchgear, of the remote-control type, will be operated from a control gallery overlooking the engine house.

At the north-west end of the station there will be a substation, designed to contain four 1,000-kw. sets of converting machinery incidental to the supply and control of the auxiliary current required in the station. &c.; above the sub-station a 3,000 ampere-hour capacity battery for general direct-current supply and an excitation and switchgear tripcoil battery will be accommodated on the first and second floors. Between the engine house and boiler house a pump hall will be situated containing, as a first instalment, two steam-driven and one electrically-driven boiler feed pumps, each with a rated capacity of 25,000 gallons per minute, being provided; the upper part of the feed pump bay will

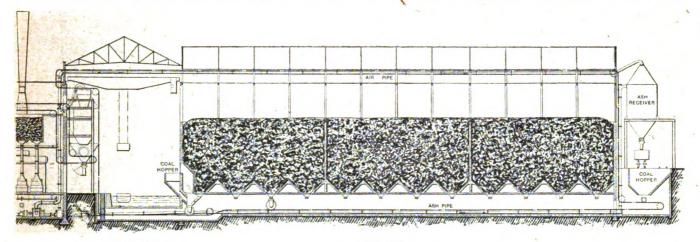

contain hot-well and reserve feed-water tanks. The feed make-up will be obtained from the Bridgewater Canal and treated in a water-softening plant. Between each pair of turbine sets there will be an open well containing the condenser auxiliary plant, and between the first turbine and sub-station there will be a repair well, with a railway track below at ground level, connecting with a general workshop forming a continuation of the switch house, but detached from it.

The dismantled machinery will be transferred by an overhead travelling crane on to a trolley in the repair well and passed straight into the workshop. At the other extremity of the engine house a similar unloading well will be provided, the railway track being in connection with the general railway

will result in important ecomomies in the subsequent purification processes. The roadway separating the engine room and switch-house will be roofed in and equipped with a travelling crane for lifting and moving the transformers from the adjacent switch-house.

The present designs contemplate for the complete station eight generators, and eight 33,000-volt feeders, running to a central distributing station in the existing area of supply—near which a large number of the existing H.T. feeders from Stuart Street station pass—where it is proposed to step down the pressure to 11,000 volts.

It is intended to utilise the existing Manchester H.T. 6,600-volt three-phase feeders for 11,000-volt working; the existing feeders adjacent to the proposed distributing

BARTON GENERATING STATION, FOR THE MANCHESTER CORPORATION ELECTRICITY DEPARTMENT.

system. The design adopted provides a spacious engine room, as the pump hall at the side is open to the main building below the crane girders, and the sub-station will also be visible through three open arches.

Reference to the sectional elevation shows two circulating water inlet culverts below basement level, and adjacent to them two corresponding outlet culverts at higher level. These will be connected to the Davyhulme sewage works, it being proposed to erect a pumping station there, equipped with electrically-driven high-lift pumps, and with a substation overhead for controlling the supply to the sewage

station will be coupled to the 11,000-volt bus-bars in the latter, and suitable transforming arrangements provided at Stuart Street station and elsewhere in the area to utilise the higher voltage.

We understand that the switch arrangement at Barton provides for coupling the generator direct through the step-up transformer and duplicate oil-switches to its outgoing feeder. The machines will also be connected to a coupling bus-bar through 5 per cent. reactances, and a transfer bus-bar will be provided between the feeders.

Alternative routes are available for the feeders running

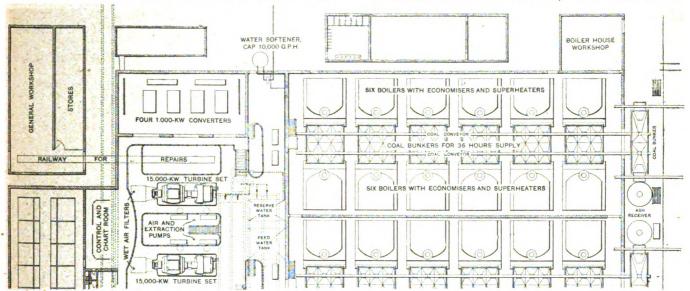

FIG. 4.— PLAN SHOWING ROUGHLY THE TUBBINE AND BOILER ABRANGEMENT OF THE FIRST SECTION OF THE PROPOSED BARTON GENERATING STATION, AT MANCHESTER.

works. The purified effluent at these works will be drawn from a large storage reservoir, which will also fulfil the function of a settling tank, and pumped up to the generating station, where it will pass through extra filters before entering the condensers; the discharge to the sewage works for final treatment will take place at a higher level than the intake, and, owing to this increased head, the capacity of the sewage works will be greatly increased. Moreover, the discharge effluent will gain some 15° in temperature, which

from Barton, i.e., along the towpath of the Bridgewater Canal into the city at Cornbrook, and by the main road through Trafford Park to Old Trafford, and thence to the city.

city. The new distributing station will, if the present proposals mature, consist of two main switch and transformer buildings divided by a bay, which will be equipped with a travelling crane and lifting appliances for removing the transformers from the adjacent buildings. Each half

of the station will be coupled to four 33,000-volt feeders and equipped with 33,000-volt and 11,000-volt ring bus-bars.

Parliamentary estimates of the operating cost of the Barton station, on a 40 per cent. station load factor, and with coal at 9s. per ton, show works costs 138d., capital charges 088d., or a total cost per unit, apart from administration charges, of 226d., this figure comparing with a similar total cost for Stuart Street station, with a 37 per cent. station load factor, of 383d. per unit.

cent. station load factor, of 383d. per unit.

On the present annual output from Stuart Street the difference in favour of the new plant would be nearly £57.000 a year.

The estimated capital cost of the completed Barton station, including the culverts to Davyhulme, is £11, per KW.

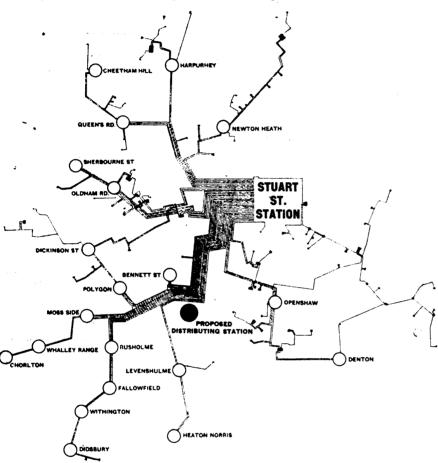

FIG. 5.—THE MANCHESTER 6,600-VOLT THREE PHASE NETWORK, WITH PROPOSED DISTRIBUTING STATION, EXISTING CORPOBATION AND CONSUMERS' SUB STATIONS.

Except as regards its adjacent situation, the Barton station will, under present arrangements, have no connection with the growing manufacturing area of Trafford Park, where, at the present time, many concerns possess their own power plants, and the local power supply in the Park averages under 3,000 kw., representing some seven million units a year.

We believe it is no secret, however, that the existence of the huge plant at Barton, in close proximity to the Ship Canal and this favoured manufacturing area, is expected to lead to far-reaching developments in the future.

In conclusion, we are indebted to Mr. S. L. Pearce, the chief engineer of the Manchester Electricity Department, for permission to publish these preliminary details of the scheme for which he is responsible, and which is a considerable advance on anything of the kind in this country. We have drawn where necessary on his Parliamentary evidence in support of the scheme, and are indebted to him for the plans and drawings which we reproduce.

A Fifty Years' Anniversary.—On January 1st, Messes. W. J. Stokyis, Ltd., of Arnhem, Holland, specialists in electrical fittings design from the old Dutch masters, celebrated the completion of 50 years' establishment of their business as an industrial concern.

THE TELEPHONE INDUSTRY IN SWEDEN AND ELSEWHERE

It is well known that Sweden occupies a leading position in the telephone industry, and as the present state of affairs is not altogether satisfactory in some branches, it is of interest to see how the matter is regarded by the Swedes themselves, as indicated in an article in the Affarsvarlden.

In the spring of 1912 there was keen interest on the Stockholm Stock Exchange in telephone shares, and especially in the shares of the L. M. Eriesson Co., which resulted in a considerable loss to the "bulls." The market was infected by a certain nervousness, which was very likely due to the new technical methods which, during recent years, have been discovered, and which have threatened to disturb even the fundamental principles on which the Swedish telephone industry has been built and prospered.

The automatic telephone of Betulander has been disposed of to

sphone of Betulander has been displeed of to the Marconi Co., which, no doubt, intends to make a big thing out of it, although the experiments with it have not been concluded as yet. The large electrical companies in Germany have also a number of new inventions in hand, and have been making preparations in order to put them on the market. In the case of the English L. M. Ericsson Co., it will be seen in the last report that the sale of their products has been found to be insufficient, and it has consequently been decided to take up the manufacture of cheaper apparatus of a more simple construction. The subsidiary American Co. has for some years up to, and including, 1912 been run at a loss, for which reason the Swedish Co. has been obliged to write off a large amount on the shares in the subsidiary company. There are also certain symptoms which show that the free markets for telephone materials are tending to become more restricted, and sales are thus not so easy now, because they are becoming more and more dependent on the interests, which the buyers or the large consumers, who have monopolised concessions in various forms, have in

common with the sellers.

In America the Bell Trust rules with nearly despotic authority over 8 millions of subscribers, and is able to control sales altogether. On the other hand, the Swedish industry has been able to hold its position, and has even made good progress. The value of goods exported from the L. M. Ericseon factories rose in 1913 to £444,450, as compared with £405,550 in 1912 and £388,900 in 1911, and the turnover of the Russian subsidiary company has grown considerably, as is also the case with the companies at Vienna and at Buda-Pest. A considerable portion of the Swedish exports is, however, going to the subsidiary companies at Warsaw and Moscow, and in Mexico.

going to the subsidiary companies at Warsaw and Moscow, and in Mexico.

The supply of telephone materials has lately become more and more dependent on the financing of new telephone systems. If such systems are promoted by the State, the

as Sub Stations.

the financing of new telephone systems. If such systems are promoted by the State, the latter is always inclined to favour the home manufacturers as much as possible, and if the concessions are held by private companies, these are sure to favour the telephone manufactories with which their leaders may have financial connections of some sort.

The telephone industry thus stands in intimate contact with finance, and it is a fact that the greatest victories of the Swedish telephone industry during recent years are partly due to the co-operation of Swedish financiers. The concessions at Moscow and Warsaw of 1900 were secured chiefly by the direct work and by the personal visits of the financiers, Mr. Wallenberg and Mr. Glückstadt, and the Mexican concession of 1905 was also due to Mr. Wallenberg, while the erection of the branch works at Paris, Vienna and Buda Pesth may be attributed to bank director Fränekel, and his connections and personal visits to the said places. All these represent splendid examples of what can be done, when men of the industry and finance are working in co-operation. At the present time it is rare to get a large concession for telephone lines without the concessionaire being prepared to offer the State or the municipality concerned a substantial reward in the form of a loan.

reward in the form of a loan.

This was the case with the important concession at Constantinople, and the tendency in this direction seems to grow. There is a considerable amount of capital in the country, and Sweden has managed to finance a number of enterprises abroad, but there is also a requirement for foreign capital, and in the case of the Russian concession a sum of 15 million frances was obtained in France in the form of a mortgage at 4½ per cent. If the Swedish telephone industry is going to retain its position, it will thus have to seek co-operation with the world of finance, and the amounts in question at the present time are more than Swedish capital alone can supply. By a prudent combination of the Swedish technical superiority in the telephone industry

and the financial resources of England and France splendid results

ought to be achieved.

In China, in 1911, a plan was prepared on a large scale for a rearrangement of the entire telephone service, comprising plans for the building of telephone lines and of telephone manufactories. It has, however, been impossible to do anything owing to lack of the plant of the control capital and on account of the political conditions. The latter are now gradually improving, but the want of capital is now greater than ever before, and there is an unprecedented bargaining with concessions against ready cash. The L. M. Ericsson Co. during the years 1911 and 1912 took the trouble to Ericsson Co. during the years 1911 and 1912 took the trouble to investigate the Chinese conditions at an expense of nearly £2,000, and should thus be fairly well acquainted with the state of things there. There ought now to be a good opportunity to get hold of important concessions, in which French and English capital might co-operate with the Swedish industrial ability, and both secure excellent profits. It is not the intention to give the details of such a plan here, but our contemporary says France, for instance, might very well give large loaps on the concessions, and the most important places could thus be supplied with telephones and telephone lines, while the materials for the same could be supplied either from Sweden or from local manufactories to be erected in various places. The State or the municipalities in China ought various places. The State or the municipalities in China ought also to be interested by being offered a certain portion of the profits, or by getting a certain number of free shares in the prospective companies. It could also be regarded as a certainty, that the Chinese capitalists would contribute to the investments and the more so, as the main company would be of Swedish nationality, which in political respects must be regarded as a neutral country altogether.

It would, of course, be advisable to proceed with great caution and not quicker than the political conditions might warrant. It also stands to reason that such a scheme would be very complicated. But there is much to gain from such an enterprise, and it would mean a grand future to the Swedish telephone industry, if it were able to secure a large portion of the sale to a country with 400 million inhabitants. There are also certain Balkan States, which no doubt would be quite willing to entertain a proposition the direction indicated above owing to their

difficulties.

NEW ELECTRICAL DEVICES. FITTINGS AND PLANT.

Jowers's Protective Leakage Device.

To obviate the inconvenience and loss caused by a small motor breaking down to earth and tripping the switch controlling the supply to a whole group of motors, the GENERAL ELECTRIC Co., LAD., of Witton, Birmingham, have introduced a device which Leakage current flowing through the trip coil actuates a mechanism which short-circuits the no-volt coil if the motor is running, and shuts it down; while if the motor is standing, the leakage current actuates a catch which looks the starter preventing any attempt at starting.

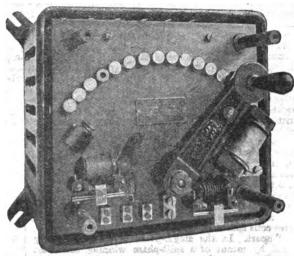

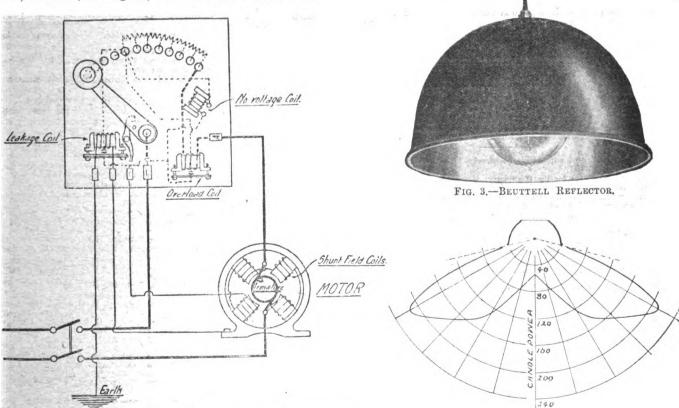

FIG. 2. WITTON STARTER EQUIPPED WITH THE JOWERS DEVICE,

The Jowers device is claimed to safeguard the supply and the operative, since a faulty motor is immediately cut out of circuit.

The connections for this device and the additional coil on the Witton starter are shown in the accompanying views.

New Street Lighting Reflector.

With a view to improving street lighting whilst still complying With a view to improving street lighting whilst still complying with the requirements of the authorities as to reduced illumination, by outting off the upward rays and producing a minimum illumination over a maximum area, MESSES. A. W. BEUTTELL, LTD., of 109, Victoria Street, Westminster, S.W., have designed an aluminium reflector, whose general appearance is shown in fig. 3. The reflector is provided with a suitable opening at the top, so that it may be alipped over the existing lamp or lamps and adjusted in the correct position relatively thereto. The performance of the reflector is shown by the light distribution curve given in fig. 2, from which it will be noticed that it is of the extraintensive type with the maximum illumination at an angle of 30° intensive type with the maximum illumination at an angle of 30°

can be fitted to their standard D.C. motor starters. With this device the motor is completely insulated from earth, except through the usual earthing conductor, in series with which is inserted a low-resistance trip coil.

Fig. 1.—Connections of Witton Motor Stabter Equipped with

THE JOWERS PATENT LEAKAGE DEVICE.

and as nearly ideal for street lighting as is practicable under the circumstances. This reflector is now ready for the market, and the makers will be pleased to co-operate with central station engineers with a view to adapting it to their individual requirements.

FIG. 4.-LIGHT DISTRIBUTION CURVE.

Reactive-Factor Meters.

Although instructed to keep the power-factor of the circuits over which they have control as near unity as possible, switch-board attendants often think that a power-factor of 1 or 2 per cent, less than unity is good enough and do not try to improve it. If instead of the power-factor meter use be made on the circuit of a reactive-factor meter, a condition of 985 per cent, power-factor is indicated as 175 per cent, reactive factor, and the attendant will

be more apt to improve it.

A resotive-factor meter, which has recently been introduced by the Westinghouse Electric and Manufacturing Co., Rest Pittsburg, Pa., operates on the rotating-field principle in a manner similar to that of a power-factor meter placed on the market by the same company. A rotating field is produced in angularly placed coils connected in shunt with the metered circuits, one being used for each phase of the system in the case of polyphase meters used for each phase of the system in the case of polyphase meters. A movable iron wane or armature is placed in the field and in magnetised by a stationary coil, the current in which is proportional to and in phase with that of the line current in one phase of the circuit. As the iron wane is attracted or repelled by the rotating field of the angularly placed coils, it takes up a position in which the zero of the rotating field is indicated at the same instant as zero of its own field. Thus its position gives the phase angle between the voltage and the current of the circuit.

The reactive factor meter is calibrated to read the sine of the

The reactive-factor meter is calibrated to read the sine of the angle indicated, while the power-factor meter is calibrated to read the cosine. In the three-phase meter the rotating field is produced by three coils spaced 60° apart and in the two-phase meter by two coils 90° apart. In the single-phase meter the rotating field is produced by means of a split-phase winding connected to the "voltage" circuit. The meters are enclosed in round dust-proof cases and are built in two size, the diameter of one of which is

7 in, and of the other 9 in.—Electrical World.

G.E.C. Opal Shades.

THE GENERAL ELECTRIC Co., LTD., of 67, Queen Victoria Street, E.C., have, in conjunction with an old-established firm of English glass manufacturers, introduced a new opal shade, in the "Ogee" shape, as shown in fig. 5. The shape is adapted to the

FIG. 5.-NEW G.E.C. OPAL SHADE.

needs of the tungsten lamp, and is stocked in two sizes, 7 in. diameter and 9 in. diameter by 4 in. deep; the glass is claimed to be an improvement in colour on the usual foreign-made conical pattern.

BUSINESS AS USUAL.

IT is difficult for the most strenuous advocate of the doctrine, "Business as Usual," to prevent his thoughts from wandering to the great War which is at present convulsing Europe.

And this is well; for when he is trying to devote one part of his mind to his business, and another to the fortunes of British soldiers in the field, he must inevitably be led to consider what is meant by the phrase: "Business as It was written of old that "to the solid ground of Nature looks the hand that builds for aye"! And so, war being an essentially natural phenomenon, it is not unprofitable even for the man of business to consider it from various points of view.

In the application of the maxim which heads this column, it is essential to remember that this is a race war. It might almost be said, without any disrespect to the gallant Allies of this country, that it is a race war between Teuton and Anglo-Saxon. Which shall survive? On August 4th. 1914, the English happened to be in possession of a considerable portion of the more attractive parts of the earth's surface. As a wit was once heard to say, "We came by many of our Colonies in a fit of absentmindedness," but there they are. We are the men in possession. Your twentieth century Teuton says: "True, you Britons are in possession; but let those that have, hold on, if they can."

How, then, if the Germans are going to dispute our title to our possessions, our claim to be rulers of the waves; if they are going to make war against our trade and our commerce in every quarter of the globe, can we afford to conduct our business as usual? Must not millions of British soldiers be ready to meet and slay the legions of the Kaiser? Upon hearing that the manhood of Germany is going to take the field, your armchair alarmist, who is unbiassed by any knowledge of military affairs, is heard to exclaim: "Every Briton capable of bearing arms (except me) should enlist at once."

It is only when one grasps certain fundamental points about the present war that the necessity, the vital necessity, for keeping our industries, or a large number of industries, going on as usual is forced upon our minds.

In the first place, all that is involved in the word army is not to be found in the battalions drawn up for inspection. In addition to the Reserves, there is much else to be thought of besides the number of men who are able to take their places in the fighting line. Equipment and reserves of equipment have to be provided. Arms and ammunition have to be supplied, and in these days of the application of science, and in particular of the application of electricity to the needs of warfare, scientific instruments have to be made in enormous numbers, and at enormous speed.

Your amateur strategist who talks airily of an army of a million men forgets the numerous factories which must be kept going if that army is to appear as an efficient fighting force. He is heard to complain of the bad recruiting in certain industrial centres : but he forgets, nay, he never had the wit to realise, that the man who is working 10 hours a day in blue jeans, at lathe or forge, is often serving his

King and country just as well as the man in khaki who is wallowing in the mud of Flanders!

It has been said: "You cannot improvise an army!" The truth of this statement is realised when one appreciates (in the light of what we have said above) the real meaning of the word "army." The private soldier can be trained in a comparatively short period of time; but arms and equipment cannot be conjured up from nowhere. Nor can your "soldier of industry" be improvised. He must be trained, and it takes years from his youth up to make him efficient. To empty the engineering workshops of England at this moment—to allow skilled fitters and mechanics to enlist in the ranks—would endanger the safety of the country in a marked degree.

Another consideration forces itself upon the mind. Although the Germans have called many million men to arms they are still, in one sense, carrying on business as usual. We say this because, for the last 30 or 40 years, preparation for war has been part of the business of the subjects of the Kaiser. They have invested large sums in arms and armament, and in ships; the War Council has expended a large proportion of the vital force of the male population in training youths to arms. For all this expenditure they expect something in return. They expect (or at any rate did at one time expect) to get that return as a

result of the present war.

In these circumstances it is necessary for English people to realise the necessity for "business as usual;" and business as usual is not incompatible with sufficient recruiting. It is safe to say that the industry with which this journal is primarily concerned renders most valuable services to the War Office, as well as to the Admiralty. electrical engineering shops shut down through skilled mechanics being called away to the War, there would be

panic in Whitehall.

We assert, therefore, that the manager who knows the qualities of his men may be doing a positive disservice to his country if he encourages those who can exercise high mechanical skill to join the Army. The pity of the voluntary system is that it is the most intelligent who are most obedient to the call of patriotism. The cream of the industrial population is skimmed off; the worthless are left behind. The hefty village loafer—the kind of man who is capable but lazy—views the greatest war of all time with supreme indifference. As he watches the battalions of recruits march by to the tune of "Tipperary," he comforts himself with the reflection: "Even if they are killed, and even if the British Army is wholly annihilated, there will still be a public-house for me to lean up against'

To bring pressure to bear on the strong and healthy labouring classes to join the army is clearly the duty of everyone; but to keep in full swing the industries of the country, particularly those industries which are of primary importance to the naval and military authorities, and thus to carry on business as usual is also an urgent necessity.

THERE has been a very strong tendency in the copper market lately, and the extent of the upward movement which has been seen has taken people here quite by surprise. There is no doubt that the worst points of the depression arising from the war have been passed now, but nobody was prepared to find prices soaring skywards as they have been doing of late. The main impulse of the rise came from the United States. There, there has been a continual grumbling by the German-American copper interests, who found that the action of Great Britain and France in declaring copper contraband had had the effect of shutting off their export trade to their friends the Huns. A lot of nonsense was talked by them as to the ill-effects of the contraband declaration upon the United States copper trade, disregarding the patent fact that it was the financial position created by the war which hit American industry as it hit industry in all neutral countries. A sort of grievance was thus set up, and pressure was brought to bear in America to

have the British pulled up for interfering with ships carrying copper to "neutrals." The point that the said neutrals were taking huge quantities of copper, which under no possible combination of circumstances could they consume legitimately in the usual way of their trade, was glibly passed over, but American-German opinion is strongly in favour of the British attitude being materially modified, with a resulting large increase in the American copper

exports to Germany by way of neutral countries.

Some flagrant cases of smuggling have been detected, and what with the United States Government concealing details of shipments in order to assist the contraband trade, and the issuing of fraudulent manifests and the concealing of copper in bales of cotton and under grain cargoes, it will be seen that the British Government have a very good defence to any action they may have taken to put a stop to illicit shipments of copper. It is hardly to be supposed under these circumstances that the safety of ourselves and our Allies is going to be imperilled by too tender-hearted a regard for the German-American copper millionaires who are now squealing. It is to be hoped not, at all events. It is very curious how these people change their tune. When complaining of the wicked British Navy in stopping their tricks they whine in the usual way, but the next minute tell the newspapers, as Mr. Vogelstein did a few days ago, that the copper shortage in Germany "is not going to have any bearing upon the war. Without denying the fact that the cutting off of supplies of copper is annoying to the highly developed German industry, it is of minor importance to the Germany army and navy. Germany is merely annoyed without being hurt." It is a very different tale, however, which this German-American tells in official circles.

The interim reply of Sir Edward Grey to the Note of the United States contains some very instructive figures, which fully bear out what has been stated in this column from time to time with reference to the rate at which the United States has entered the contraband business. Sir Edward recites the official details given by the United States of the copper exports from that country, showing that for the months during which the war has been in progress up to the end of the first three weeks of December, the exports were 361 million lb. against only 151 million lb. in the same period of the previous year. Norway, Sweden, Denmark, and Switzerland are not shown separately in the returns, but are included in the heading: "Other Europe." Under this heading the figures for last year are $35\frac{3}{8}$ million lb., and for 1913 only $7\frac{1}{4}$ million lb. It is very justly pointed out that the presumption is strong that the bulk of the copper recently consigned to those countries has been intended not for their own use, but for that of a belligerent who cannot import direct. Under these circumstances, the British Government cannot be expected to abate their efforts to put a stop to the contraband trade in copper.

With America buying warrant copper and producers pushing up their prices in New York, there has been a sharp advance, but prices really look quite high enough. Trade buying is quiet, but general consumption is fully as good as

can be expected.

Ability of British Electrical Firms.

WE have received a letter from one of Manufacturing the largest British electrical manufacturing firms regarding certain statements which appeared in the article on "We Can't take the Risk," published in the

ELECTRICAL REVIEW for December 25th, 1914. The firm in question express their desire to demonstrate to "R.S.T.V.," the writer of the article, or to anybody else who may be in the market, that the time mentioned by him for the delivery of a 10-H.P. motor is far from representing the present ability of British manufacturers. The firm's own position is that they can meet such a requirement, and any others in reason, in a considerably less period. They feel that, though "R.S.T.V.'s" statement may not have been intended to cast a reflection upon the ability of electrical manufacturing firms in Great Britain readily to supply electrical apparatus, it is likely to have that effect unless it be understood that the writer

of the article was merely expressing an individual opinion, and one which, though it might correctly apply to one particular case, cannot be applied generally. We ought, perhaps, to say that we have ascertained that "R.S.T.V." was not personally a buyer of motors. We hope that our readers, both at home and in the Colonies, have gathered from our editorial comments on the position as it has developed since the outbreak of the war, that though our factories are necessarily engaged upon a good deal of Government work, they have in a number of cases adopted measures which will prevent delay in the execution of ordinary electrical business. Any impression, such as gained currency in some parts of the world some months ago, that foreign buyers could not depend upon British works promptly to fill electrical orders, is entirely erroneous. We repeat the appeal to Colonial and foreign buyers that we made in the early weeks of the war, to continue to keep a welcome stream of orders for all classes of manufactures flowing into this country.

Censorships of Cable Telegrams.

THE Daily Chronicle, on the 9th inst., published an article on "Cables and Commerce: How to Kill the Enemy's Trade," and therein gave it as its opinion

and therein gave it as its opinion that some slackness was shown by cable censors, and that the Government should take possession of the cables as they had done in the case of the railways and wireless It was an easy matter for the Government to take charge of the wireless stations in this country, as they are all British-owned, but the case of the Atlantic cables is far different, they being now the property of and controlled by American companies, who, to judge by recent experience, would quickly obtain the aid of their Government in the righting of any grievance, It seems to us that the greatest danger to the country from a telegraphic point of view is not so much the manner in which the censors perform their duties—we believe they are manfully striving to do their best in a very difficult and complex matterbut the ability of our enemies to conduct their telegraphic correspondence as usual through the media of contiguous neutral countries and the cables landing on our shores. Telegrams, like copper or other commodities, should be treated as contraband and confiscated where there is reasonable belief that they are intended for purposes inimical to our country's interests. In this respect, telegrams passing to and from Holland, Norway, Sweden, Denmark, Italy, Spain, Switzerland and Monaco should be specially scrutinised. It must be evident that if, as reported, the trade of countries washed by the North Sea has so grown that shipping facilities have had to be largely increased, a growth of telegraphic business is bound to occur, and what is the use of having the largest and widest telegraphic system if steps cannot be effectively taken to neutralise the efforts of individuals to profit from the disasters of the war and to our detriment?

We have been informed that the Atlantic cable companies' figures for traffic from Scandinavia have increased to a very large extent, and this goes to prove our contentions above set forth. If necessary, the cables landing on our East Coast should be closed during the war, lest messages should be forwarded to countries from whence supplies are largely obtained, intended for ultimate use by our enemies. There appears to be little ultimate use by our enemies. There appears to be little use in clearing the seas of hostile fleets if trade with our enemies is to proceed unhampered; every effort should be directed towards diverting trade to Great Britain, and making her the entrepot for supplies, the re-export of which to neutral countries could be then efficiently ordered, and the incidental profits would be earned by those whose resources are being so largely called upon to rid the world of militarism, and to establish conditions making for a lasting peace, conferring benefits on humanity at large. In conclusion, we may say that centralisation of all censorship at the Central Telegraph Office would not, in our opinion, increase efficiency, and the incompetence or slackness of any one censor, if it existed, would not be overcome. In fact, we think confusion would arise, as the number of commercial

and private telegrams to be dealt with is far in excess of the number of Press telegrams, and the centralisation of work in connection with the latter is, therefore, an easy matter.

In an article commenting on the South African occurrence of a serious winding accident Winding recently, our contemporary, the South Accidents. African Mining Journal, mentions that there were in 1913 in the Transvaal 81 overwinds or runaways, and that in 13 cases death or injury resulted. Of these overwinds, &c., 30 occurred with electrical hoists, and it would be instructive to learn how far they were responsible for the casualties mentioned. causes of Rand overwinds have been most carefully considered by the Mines Department, and it has been found that, apart from accidents due to failure or beakage of plant, at least five distinct classes exist attributable mainly to Most of the causes cited should not (and may not) apply to electric winders, in view of the automatic safeguards provided, but Class IV: Lowering unbalanced with electric winder on counter-current, too great speed developed, or too sudden application of reverse current, failure of resistance control of rotor, tripping of switch of stator circuit and failure of single brake to control runaway drum, may be of interest to those who are studying

the electric winding problem in this country.

Swiss

in which a country that is not directly Engineering affected by the war may be indirectly and the War. involved in some of its consequences is afforded by the case of Switzerland, which was compelled in its own defensive interests to mobilise on the opening of the war, and subsequently to recall its Reservists from different countries, including Great Britain. How the engineering trade was concerned will be understood from the report issued in December by the directors of the Oerlikon Maschinenfabrik, which may be accepted as a representative example of the conditions which prevailed in the case of all engineering works in that country. The report states that, owing to the mobilisation of the Army, more than one-half of the workmen and officials were called up for service. It was no longer possible for the workshops to effect deliveries, as every working organisation was broken up. The receipt of new orders was brought to a complete standstill, and the forwarding of finished manufactures, as well as the supply of raw materials, almost entirely stopped. Nevertheless, and as a consequence of the large stock of orders, it was possible to maintain working operations without interruption, although with a reduced In the meantime, a slight improvement has taken place in the arrival of orders, although concern as to the future has not yet been overcome. The directors do not mention the fact that a number of workers have been temporarily released from field service in order to resume their normal occupations, so that, for the time being, the

A TYPICAL illustration of the manner

A GOOD deal of mystery has been made of the communication of news of the sinking of the Formidable to Germany by the submarine which is alleged to have caused her loss, and it is suggested in the daily Press that the news must have been forwarded by agents of the enemy within our coasts. Sir Oliver Lodge, in a letter to the Times, goes even further, stating that "the public should not suppose that an aerial erection is necessary to wireless signalling; nor need every kind of message be perceptible to adjacent ships. The enemy nation knows at least as much as we do about the

supply of labour should now be more favourable than in

the first two or three months of the war.

applications of science, and has had forethought in employing them." We do not know exactly what suggestion is intended to be conveyed by Sir Oliver's remarks; is it possible that he is referring to the telepathic methods of communication in which he is known to be so deeply interested? Glendower claimed that he could "call spirits from the vasty deep," but Hotspur questioned whether they would come when called, and we really doubt whether the Germans, in spite of their proclivity to Satanic methods, are so closely in league with the nether world as to possess supernatural means of communication.

But there is no need of mystery. The disaster took place at 2 a.m. on January 1st, whereas the German communique was dated January 3rd. Mr. P. A. Hislam, in the Globe, points out that, assuming that the news was received at Ostend, the nearest German base on the coast, as early as 3 p.m. on January 3rd, the submarine had 60 hours in which to traverse a distance of 200 miles, bringing her within 100 miles of Ostend, at which distance no doubt she could deliver the message. That is to say that she need only travel at an average speed of 3½ miles an hour to effect her purpose. If, on the other hand, the news had been transmitted through this country, it would probably have been received in Germany on New Year's Day.

The foregoing is based upon the Admiralty statement that the disaster was due to a submarine, and not to a mine; but when the conditions are considered—a stormy sea, the ship travelling at 16 knots, and no light but fitful moonlight—it is difficult to believe that any submarine could accomplish the apparently impossible feat of striking the ship twice. It seems more probable that the disaster was due to mines, and that the German claim that it was caused by a submarine was merely bluff.

TECHNICAL TEACHING AS A PROFESSION.

BY A TEACHER.

During the last 20 years or so a new profession has been gradually rising in these islands, that of technical teaching, and the purpose of this article is to indicate the opportunities and scope it offers to young men who may think they have a liking for this class of work, as well as to state frankly the disadvantages connected with it. The whole subject is quite modern, for it has grown up naturally with the rise of technical schools and institutes in our midst; furthermore, as such schools and institutes are still being equipped in ever-increasing numbers in all parts of the country, there is likely to be increased scope in the future.

The chief departments into which technical teaching, as a whole, is divided, are Engineering, Physics, Chemistry, and Textiles. There are subsidiary departments such as Mathematics and various trade classes, but the four abovementioned form the nucleus round which the others move and have their being. Technical teachers, therefore, usually belong to one of the four. The subsidiary classes are often in charge of instructors who during the day are carrying on their ordinary duties in the workshop or factory, and who are paid so much for a couple of hours twice or thrice a week—such occasional teachers being under the discipline of one of the heads of the four main departments.

The Institutes where teaching of a technical nature is carried on are many and varied. The large cities possess their great schools, specially equipped with the latest and best types of experimental machinery and apparatus, while the smaller towns and even villages have their necessarily more limited and circumscribed centres; and the character of the teaching of course varies with the size and importance of the Institute. In such great schools as those of Manchester and Glasgow, for instance, all kinds of day work are carried on, some of it advanced and of University standard. In the smaller places, however, day work is not an important feature. And even in the largest and best of our schools, the instruction given to evening students holds first place;

indeed, it is because of, and for, evening students that the technical school may be said to justify its existence.

The man who desires to take up technical teaching as a profession is in for a pretty laborious time. There is plenty of work and very little play. If we take as an example the case of an engineering instructor, we find that the training this man will have to undergo may be outlined as follows:—

(a) Good elementary education.

(b) Good secondary education.

(c) Apprenticeship of five years or so in an engineering works.

(d) University or equivalent training in the science and theory of engineering.

A University, or equivalent, degree is essential, and for the most part the former is insisted upon nowadays. It is true there are ways and means of evading the spending of three years at the University, such as taking an external degree, or winning a Whitworth Exhibition or Scholarship; but these are not in the direct line of advance, so to speak, and in general necessitate a terrible time of stress for the successful man. Actual experience in teaching is only obtained after the candidate has secured a position. Perhaps it is just as well. Any theoretical course of teaching in the technical line is, in my opinion, useless and unnecessary. The types of students under instruction are, as a rule, anything but homogeneous as regards their previous knowledge and training, and the teacher has to adapt his methods to each. If he has the gift for this work, he picks it up in the easiest and most natural manner, and if he has not, he can never, no matter how much he tries, be

much of a success.

When the candidate has undergone the essential preliminary training, he is ready to take up the first suitable

position that offers.

The salaries and the emoluments, as well as the capacities of these positions, vary greatly. The smaller technical schools offer from £200 to £250 per annum to the head of a department, and from £120 to £150 to a subsidiary teacher. The largest Institutes give from £500 to £700 to the head, and from £300 downwards to the other instructors. The principals also receive salaries commensurate with the size and importance of the school; in a few cases up to £1,000 a year is paid, and in the case of the smallest places down to £200. After some years spent in teaching, a technical instructor may take an opportunity presenting itself of becoming the principal of one of the smaller schools, where he will most likely have to combine a lot of organising work with a certain amount of teaching. Principals in the larger schools seldom do much teaching, their time being usually fully occupied with matters of business detail.

Occasionally a teacher may have the opportunity of leaving the technical school for the University, and may in time rise to a Professorship there, but these cases are necessarily limited. Opportunities of going to the Colonies and Dominions also present themselves from time to time, and there is some competition for such positions, because the salaries offered are often more substantial than those ruling at home.

There is also the chance of becoming an Inspector under the Board of Education, where remuneration for the higher grade work commences at about £400, and rises yearly. Then there are by-ways into which the technical teacher may either accidentally or purposely enter. He may go to India or to China and teach elementary stuff to the natives there; he may write technical books; he may, if he can find the time, go in for research or invent apparatus for experimental work; he may review for the technical Press, and

It should be clearly stated that, like other forms of teaching, technical instruction offers little chance of a fortune to the man desirous of taking it up. At best, a comfortable living is indicated, and in the lower positions, that is to say, for three-quarters of those engaged in it, a bare living only. The work is exacting. Nine teachers out of ten are required to teach at least four evenings a week for eight months of the year, and although, of course, a corresponding portion of the daytime is allowed, still the evening hours are not those usually considered most conducive to the best work. The routine is rigorous. A teacher may have a couple of hundred students to look after

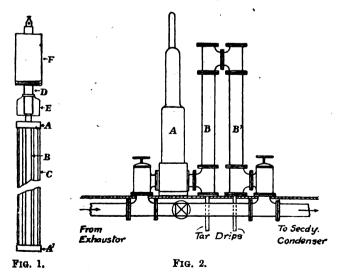

during the course of the week, students belonging to a dozen different sections and classes; there are laboratory preparations to be seen to, exercises to be marked, and a hundred and one things to be done.

And, speaking generally, the salaries paid are quite incommensurate with the work done and with the previous prolonged and expensive training required; indeed, I might say that, as a whole, technical teaching is badly underpaid. A few-a very few-reach positions of comfort and even of comparative affluence, but for the vast majority there is nothing to look forward to. The reason for this unsatisfactory state of affairs seems to lie in the fact that the supply is greater than the demand—a strange position when looked at in a superficial light. But the truth is that young fellows who have just finished a University course, and who may not have their careers mapped out for them by wise or influential guardians, gravitate into the technical teaching profession as easily as flies into a jar of treacle. The commencing salary appeals to them, for they look upon £120 to £150 per annum as rather princely, after earning nothing at all for years past. And once in, there is little chance of getting out. And so it comes about that the supply is greater than the demand, and that the authorities concerned can advertise for a University degree man to teach engineering for £120 a year.

As a general conclusion, I strongly advise all those who have not a strong and very pronounced bent for this class of work, to leave it severely alone.

ELECTRICITY IN THE PURIFICATION OF COAL GAS.

To the electric lamps which are used to light gas works and the electric motors which are used to supply motive power, there is likely to be added, in many modern installations, electrical apparatus for the separation of tar and other suspended particles from the gas. Successful large scale experiments in this connection have been made by White, Rowley and Wirth, their apparatus and results being described in an address to the Michigan Gas Association. The principles employed are those which have been employed The principles employed are those which have been applied so successfully to the precipitation of smelter and soid fumes. A so successfully to the precipitation of smelter and acid fumes. A high-tension continuous current discharge is passed between a "squirrel cage" of fine steel wires and a pipe in which the latter are mounted and through which passes the gas to be purified. Suitable current may be secured by transforming alternating lighting supply up to 20,000 or 40,000 volts and rectifying it mechanically by a synchronously rotating commutator. To eliminate risk of explosion, it is obviously essential that there be no air leakage into the precipitating chamber, and it is found that the liability to disruptive discharge from swaying or eccentric

electrodes is least if the central wire electrode is made negative. Alternating-current discharge is almost ineffective in causing precipitation.

precipitation.

Fig. 1 shows the form of electrode found best for commercial use. Into the iron pipe F is cemented an insulator D, the lower terminal of which is shrouded by a glass insulating sleeve E. A half-inch gas-pipe B is screwed into a series of cast-iron disks A A', between which run fine steel wires C forming the active electrode. The whole is mounted in suitable nipples within an outer felt-jacketed pipe, forming the earthed electrode. Large

scale tests on the electrical purification of 25,000 cb. ft. of gas per hour were made at the Ann Arbor Gas Works by mounting two 5 ft. × 8 in. diameter separating chambers B B', fig. 2, immediately behind a Pelot ze and Audouin fractional separator A. The active electrode disks were 4 in. in diameter and strung with 16 No. 27 piano-steel wires. The effective treating distance was 11½ ft., corresponding to barely 0'4 second's exposure of the gas to electrical discharge. For continuous operation a larger precipitator with longer insulators should be used, but until (after 5 hours' working) tar condensation produced leakage over the short insulators necessarily used in the experimental installation, perfectly satisfactory purification was obtained, and this with an energy input of only 0.2 kw.-hour per 25,000 cb. ft. of gas, using an equipment which cost less than £100, including erection and the necessary alterations in existing pipes. In the Ann Arbor tests, a potential difference of 20,000 volts was maintained between wires and grounded pipe, 2.6 to 3.0 milliamps, then flowing in the

wires and grounded pipe, 2'6 to 3'0 milliamps, then flowing in the high-tension circuit.

By electrical precipitation, coal gas free from tar may be obtained at any desired temperature. If separation be effected before the gas is passed through a condenser, naphthalene and lighter oils are left in the gas. Tar separated at 175° is free from water and resembles the prepared tars used for pavements. Gas thus freed from tar can be cooled in a washer-cocler, any particles of naphthalene then remaining being separated by a second electrical precipitation. Tar cooled in contact with coal gas absorbs some of the illuminants, hence by removing the tar while electrical precipitation. Tar cooled in contact with coal gas absorbs some of the illuminants, hence by removing the tar while hot, the illuminating power and calorific value of the gas are improved. By eliminating tarry naphthalene deposits in the scrubbers, cleaner ammonia liquor of uniformly high strength is obtained, and by passing the hot or cold gas up acid towers, ammonium sulphate can be made directly. At present iron oxide purifiers arrest tar fog by mechanical filtration, but at the cost of decreased efficiency in their proper work; with clean gas, oil and tar films are not deposited on the oxide, which therefore works better and longer. In conclusion, it should be noted that the better and longer. In conclusion, it should be noted that the same type of precipitator will purify gas and precipitate smoke, thus preventing the escape of dense smoke during retort filling and producer poking.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUENDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Advertising and Character.

In response to your invitation for opinions regarding advertisements, I beg to submit the following remarks.

I may, perhaps, first mention that I have the privilege of supervising and purchasing the plant and stores for several installations, and am directly interested in matters electrically from EHT. supply down to electric bells.

I always make a point of going through the advertisement pages of several English and American journals each week, in the hope of picking up something useful, and have to admit that as a rule the English advertisements are not nearly as interesting or as instructive as the majority of the American variety. It is seldom that I see in the home papers anything of sufficient interest to cause me to reflect. Somehow or other the English advertisements do not seem to contain that amount of technical interest or walue that many American advertisements possess, and though I am far from saying that all of the American type are interesting—the "Get Acquainted," "Get Together," "Mr. Contractor," and "Mr. Engineer" class are most repellent—I must say that I find myself reading American pages with far more care than I do our own journals.

I think much of this is due to the fact that so many English advertisements contain the sort of bald information that one gets on the card of a manufacturer's representative, i.e., that Messrs. Jones & Cc. are manufacturers of every kind of dynamo and motor. As a statement of fact, this may be true, but as an advertisement it is of very little use—lots of people tell the same tale—in addition to which similar information may be found in your classified index.

May I illustrate my meaning from one or two examples in this week's REVIEW (for January 1st)—I take a few at random.

On pages vi, ix, xi and 1 (Supplement), are shown views of various dynamos and motors, but in what way do they vary from thousands of other machines made by different firms? The makers

thousands of other machines made by different firms? The makers at least do not tell us. It is possible there are a number of points about the turbine illustrated on a later page, which the makers would be glad to place before prospective buyers, but they certainly do not do so in your pages. As it is, the advertisement is a very poor one, and the illustration little better.

On the other hand, the advertisement on page xv is very much better—it contains interesting information, though it happens to deal with an accessory which I suppose is not much in demand just now. The lower advertisement on page 1 (Supplement) is good in its way. It illustrates the article and describes tersely its special features. The advertisement on page 3 (Supplement) is also interesting. I know of several occasions on which a similar page has been cut out for reference purposes—it gives much page has been cut out for reference purposes—it gives much information in a small space.

Other good advertisements from the reader's point of view are

shown on page xx [This is editorial matter.— EDS] (but not on page xix) and page xxx.

A fearful thing is that in the centre of page xxxi, where we are invited to take part in a kind of spelling competition. It may be interesting when you have worried it out, but I doubt it, so I turn

the leaf quickly.

One other thought. Some little time ago a friend was criticising the advertisements which appear in the English electrical Press, with those which are published in the leading mechanical journals, to the effect that, as a rule, they were illustrations of comparatively trifling articles. To some extent I felt the criticism was correct. The majority of purely electrical advertisements are for goods which are relatively inexpensive, though numerous, and to secure a good market for accessories and small machinery, it and only trifling layers. undoubtedly necessary to advertise largely, and, as already mentioned, in an interesting manner.

Were I a manufacturer, I should occasionally advertise a large plant, or a quite special piece of apparatus, in the endeavour to obtain a reputation for interesting and instructive advertisements. This attained, I should be sure of attention when the every-day

manufactures were shown.

January 4th, 1915.

The correspondence on "Advertising and Character," inaugurated The correspondence on "Advertising and Character," inaugurated by "Consultant" in your issue of January lat seems likely to rove over the whole field of advertising generally without any very obvious bearing on the peculiar needs of the electrical and "allied" trades. This doubtless affords not only ample but extremely interesting matter for discussion, but it is necessary to remember that though governed by the same general principles as apply to all other successful advertising, technical advertisements have special considerations to face which materially affect the application of these principles. It is on this point that an exchange of views is most needed and would be most helpful. exchange of views is most needed and would be most helpful.

Some of your correspondents seem to me to take a more pessimistic view of things than is warranted by the facts. It is quite true that any man of experience, glancing through any number of advertisement pages, can make a pretty accurate selection of those advertisements which have been prepared with some knowledge of advertising requirements, not necessarily complete or extensive. It is also true that these are but a small proportion of the whole. Still it is an increasing proportion, and those who remember what advertising was only 20 years and a normalized to have always and the second of the second advertising was only 20 years ago, and remember, too, how slowly this old world moves, have no reason to be disheartened at the

present rate of progress.

Reverting to the main subject, we are all, I take it, agreed that the first essential of a good advertisement is to attract attention.

the first essential of a good advertisement is to attract attention. But what sort of attention? I have seen advertisements which certainly attracted attention, but which were calculated to kill any buying disposition on my part as effectively as a crack on the head from a policeman's baton kills sensation. Obviously, therefore, the principle of attention needs to be applied in its proper relationship with another principle stated by Mr. Hill, as "to give a bias in favour of the advertised article."

If it were not invidious to mention names, I would pillory a recent advertisement of (excision by Censor) which has for some time been occupying a full page in (excision by Censor). The advertisement in question is a big splodge of black, through which emerge five or six lines of curiously shaped letters, the whole forming a puzzle in black and white of most surpassing hideousness. It attracted by its very ugliness sufficient of my attention to induce me to work the puzzle out, but never have I seen energy, and, apparently, enthusiasm, so perversely directed to the production of such an appalling monstrosity. It exemplified exactly the type of advertisement to which you refer in your editorial as "striking advertisement to which you refer in your editorial as "striking the eye but having, in the long rup, an unfavourable effect," in this case on the artistic sensibilities.

There is another type of advertisement which seems to me to "border on the offensive," v.z., that which tells a man what a wasteful fool he is for not buying such and such an article. In wasteful fool he is for not buying such and such an article. In this connection the principles of true salesmanship have considerable bearing. I well remember a gentleman calling on me to try and sell space in his publication. After the usual stereotyped recital of its advantages, I exp'ained that present conditions did not warrant my firm in undertaking any extension. He immediately began with, "That is a very foolish policy," and continued in that strain until I had great difficulty in dissembling my love after the classic manner. When I finally succeeded in conveying to him that the proposition was definitely and premiseculty

after the classic manner. When I maily succeeded in conveying to him that the proposition was definitely and unequivocally declined, he left me, but with a feeling that, had his journal been the only one available for our purpose, and the success of my firm depended upon using it, I was to rather commit commercial suicide

than consent to pass him an order.

On the question of British and American advertisements, a difference of treatment is rendered necessary by a difference of temperament. Personally, I prefer the British brand, just as for ordinary social intercourse I prefer a gentleman to a costermonger, however entertaining. If the use of slang phrases and "smart" elogans is desired, they are much better placed among their natural affinities than in the columns of the ELECTRICAL REVIEW

I entirely agree with your strictures on flippant advertisements so far as technical advertising is concerned. A steam turbine needs to be announced with something of its own dignity and importance. It cannot or ought not to be treated as if it were a case of Sapolio. One does occasionally encounter a good joke in connection with electrical or "allied" apparatus, but it is doubtful if the selling effect of a good joke is any greater than that of a bad one.

While, therefore, agreeing with Mr. Hill's few functions of any advertising amouncement, especial care is needed in the case of appeals to cultured, specialised and technically trained men to see

that they are carried out with a common-sense degree of dignity,

the temperate use of language, and perfect truthfulness.

We need not despair because sometimes we fall short of our ideals. It is difficult to maintain heights which, in its best moments, "the soul is competent to gain," but we can still keep our ideal in front of us, and (as you yourselves so recently did) vigorously resent the intrusion of valgarity, of bad taste, of mere triving a markness and statements not in accordance with plain tricious smartness and statements not in accordance with plain

E. J. Reed.

London, S.W., January 11th, 1915.

Salaries of Junior Engineers.

© The A.E.S.E. having agreed during last summer to curtail its activities so that electricity supply authorities and owners of private generating plants should not be in the slightest degree embarrassed during the present oritical period, the following, forwarded by the Bradford Branch of the A.E.S.E., should be of general interest:

1. According to the Times of January 7th, the price of bread has risen 27 per cent, since July 31st, 1914.

2. According to our own experience, everything that is necessary

is dearer than it was before the war.

3. According to the technical Press, the President of the I.E.E. admitted that junior engineers were underpaid, and said he hoped better salaries would be paid in future, and that our engineer managers should try to remember their own early struggles when living was much cheaper than it is now.

4. According to the advertisement pages of the ELECTRICAL REVIEW of January 8tb, there are no less than eighteen (18) advertisements for switchboard attendants and shift engineers at starvation salaries of 20s. to 30s. per week, one or two of which had the magnificent prospects of increasing eventually to the abnormal remuneration or £90 to £92 per annum

There are also one or two advertisers who dare not state the miserable pittance they are prepared to pay.

5. There is a shortage of skilled labour for contral station work due to so many having enlisted to serve their country during the war, and, in consequence, many men are doing extra work or

war, and, in consequence, many men are doing extra work or otherwise helping to keep things going on as usual, in many cases at considerable inconvenience and self-sacrifice.

What are we to understand from reviewing the facts as stated? One thing, and one thing only, and that is that our engineer managers have come to the almost unanimous conclusion that the junior engineers are not worthy of the wage of a casual labourer (who gets 74d, an hour), and that now is an opportunity of bringing a crowd of unskilled labour into the central stations and over the country and of getting these men or boys stations all over the country, and of getting these men or boys taught how to go on when things are "O.K." in a mechanical sort of way, and trusting to luck, when things go wrong, to muddle through somehow.

They, the station engineers, are at their old practice again, a practice condemned by all other business men, of cutting down the wages to cut down the expenses, forgetting that the lower they out the wage the higher their maintenance and repair bill will go,

and the final result is just the reverse of what they want.

The more that Presidents of the I.E.E. and other "men who know," ask that the junior branches be better remunerated, the worse it seems to be for them in the end. Is it spite or ignorance?

W. J. Ebben,

Hon. Gen. Secretary A.E.S.E.

London, N.F., January 11th, 1915.

Wonderful Accumulator Cells.

If you will allow me to reply to "A. W. B.'s" satirical criticism of my test cell, I should like to ask the following questions:—
Why does "A. W. B." not state the colour of the positive

Why no mention of the condition of the most-important part of

any storage battery, viz, the negative plates?

Why no mention of the fact that there is no visible white

sulphate on any of the plates?

Had "A. W. B." mentioned these points his letter would have only been a good criticism of his own lack of technical knowledge in regard to small storage batteries which are made up in celluloid

For the benefit of your readers who have not seen this cell, I may state that the positive plate is light brown, which is the usual colour of a discharged positive plate. The negative plates are dark colour of a discharged positive plate. The negative plates are dark slate colour and quite clean. I cannot follow the inference suggested by the statement: "The positive plate is now of normal siz]"; perhaps "A. W. B." will oblige. Should he care to have a 4-volt call with the ordinary celluloid separators in one side and the type used in the "Wonderful, &c.," in the other, he can test it in any way he likes; very soon he will find the peculiar affinity that lead sulphate has for celluloid separators. Sulphate of lead visible as an insoluble white salt is quite a different thing to get rid of to the invisible sulphate, which no lead type of cell can work without. work without.

The "Motorman again" remark I consider is in very poor taste;

they are not all lacking in scientific training. It is naturally an advantage to users of storage batteries for inspection lamps, &c., that if they have been forgotten (one case I know of for two years), they are in a condition which enables them to be charged up and used within a reasonable time, without the usual cleaning and repairs.

A. Faraday Hawdon.

Newcastle-on-Tyne, January 9th, 1915.

Garage Heating.

Garage Heating.

The problem suggested by "Interested Inquirer" in your "Correspondence" column of January 8th is complicated, because of the great variety of motor-car habitations known collectively as garages. A garage may be anything, from an open shed to a well-built brick house with a very wide intermediate rauge, so that the heating of each must be treated on its merits, it being quite impossible to propose any general form of electrical heating that would meet the economical necessities of most motor users. To prevent the radiator freezing I, myself, use a 60-watt carbon lamp, which, for this purpose, I connect to the heating circuit at the 1d, rate; it is put under the bonnet and the whole covered over with a piece a felt, the result is entirely satisfactory; usually the lamp is on during frosty weather from 8 p.m. to 8 a.m., costing about two-thirds of a penny, if severe frost continued for a whole week, an unusual event, with 24 hours' running per day my liability would be about 10d., not a very serious one. This experience relates to a well-built brick single garage with substantial wooden doors and the motor run in bonnet first. If I wished to heat the whole garage electrically, I should first give very careful attention to garage electrically, I should first give very careful attention to stopping up every inlet for cold air, protecting the wooden door by a liner of felt or canvas.

Contracts with Alien Enemies.

A short time ago you were good enough to publish a letter of mine in regard to the desirability of commercial men urging the introduction of a Bill, in the coming session, covering the deter-

introduction of a Bill, in the coming session, covering the determination of contracts with the enemy.

I pointed out that at the end of last session, the Attorney-General promised to go closely into the matter and possibly introduce a Bill, it only remaining with the commercial world to convince him that there was unanimity as to what was really wanted, and that practical clauses would be formulated.

In connection with this matter it is interesting to note a book, which has just been published by Prof. Finlayson Trotter, on "The Law of Contract during War." The book, of course, covers the whole field of contracts, but it is markedly noticeable in the particular case of continuing contracts (or executory contracts, as they are called in this book), that there is an entire absence of any legislation dealing specifically with the subject, and, in fact, no judgments can be cited which give any guidance by way of precedent.

May I quote a couple of sentences which give full evidence in

"An executory contract is a contract which is either wholly unperformed, or in which there remains something to be done on both sides. There is little or no authority in English law as to the effect of war on such contracts concluded with alien enemies

the effect of war on such contracts concluded with alien enemies before the commencement of hostilitier."

The whole state of the intimate commercial inter-relations between ourselves and Germany at the beginning of the war was quite unique. Trading between the two countries had developed to a degree altogether unprecedented. In no case in history has a war taken place with such collateral conditions, We cannot expect, therefore, that legislation should have anticipated all the difficulties which have arisen. Now, however, occasion demands adequate Parliamentary measures—and the electrical industry have considerable interests involved. The only thing likely to endanger any measures going successfully forward is for the commercial world to disagree among themselves and bring forward demands mutually irreconcilable. mutually irreconcilable.

T. W. Cole.

Wandsworth, S.W., January 9th, 1915.

Cab-Signalling Systems.

Four fallacies were conspicuous in the cab-signal discussion at the recent meeting of the Institution of Mechanical Engineers. These errors are :-

These errors are:—

1. Cab signals should be audible only.

2. Cab signals at present employed in England are satisfactory.

3. Railway electrification presents difficulties to ramp systems.

4. Wireless systems possess practical value.

Of these four mistakes, the first is the only one for which there ever was any excuse; but that excuse has been destroyed by repeated publication of proof of the fact that a cab signal ought to be both visual and audible. It has, for instance, frequently been shown that a driver can watch the track more constantly and more vigilantly with a cab signal that is both visual and audible than he can with fixed signals alone.

Cab-signals of the kind at present employed in England have

he can with fixed signals alone.

Cab-signals of the kind at present employed in England have produced dangerous errors. It is well known that such cab signals fail to fulfil an exceedingly important requirement, viz, that any one or more earths, and for open circuits, must not produce a dangerous error. Two cab systems that fulfil this specification have been proposed in England, but, strange to say, preference has been given to cab signals that are admittedly inferior to them.

'The third fallacy is quite novel—and equally surprising, in view of the fact that experience has conclusively proved its utter baselessness. The London underground railways present the maximum difficulty (?) that could arise—two-power rails, in addition to the two track rails. There would be, if anything, even less trouble to find room for cab-signal ramps than there has been in finding room for the stop-arm cylinders, &c.

Wireless cab systems, whether Hertzian or Faradic, are worthless. None have yet appeared that could stand a proper test. In

those that have been publicly tested (?), two earths will suffice to wreck a train. If such cab systems could be used at all, tuning on wreck a train. If such cab systems could be used at all, tuning on the locomotive would have to be resorted to; and such tuning is as impossible signally as it is possible electrically. No Hertzian or Faradic system has as yet appeared which gives three distinctive indications—one for "clear," a second for "run alow," and a third (plainly different from both of the others) denoting "stop." The writer has tested full size, in England, ramp cab signals that fulfil this important stipulation, by which all wireless cab systems have thus far failed.

It has been said that at recent wreeks at Puchy and London.

It has been said that at recent wrecks at Rugby and London Bridge, the driver knew the distant signal was against him, and that "a cab signal could not tell him more." Per contra, I have tested cab signals that not only could tell but have told the driver more. A proper cab signal would have prevented both of these wrecks, for such a signal would have given both distant and home information. information.

Detonator-placing machines are not nearly so safe nor reliable betonator-piacing machines are not nearly so safe nor reliable se cab signals. None of the train crew can hear the momentary report of a detonator any more clearly than they can the continued blowing of the audible cab signals. In the best detonator systems an exhausted magazine or a broken or dirt-clogged detonator-arm means an imperilled train; but an exhausted battery or the presence of dirt or frost could not produce any errors but safe ones in the best ramp-type cab signals.

Wm. H. Dammond.

Nottingham, December 29th, 1914.

London County Council's Electricity Bill.

Now that the time of petitioning against the London County Council's Bill (viz., February 12th) is drawing near, it is gradually becoming clear that the Bill has very little chance of success. The opposition appears to be getting so pronounced that it seems really questionable whether the London County Council itself will proceed with it even as far as Parliament.

There is still one more occasion on which the Council has to give its consent before the Bill can finally proceed, and even the supporters of the Bill seem to be getting somewhat lukewarm, if one may judge from the debate which took place when the Bill was last before the Council.

The wort of the translation and the Advisor of the Council.

The root of the trouble appears to be that the scheme is unnecessary sarily ambitious, and that practical thoroughness has been sacrificed for theoretical completeness. For instance, a great part of that huge weight of the opposition from the Councils in outer London could easily have been dispensed with without touching the scheme vitally. There seems to be no point in including a very large portion of this outer London, since the inclusion does not benefit the scheme (except in this purely theoretical idea of completeness) the scheme (except in this purely theoretical idea of completeness), while it naturally raises strenuous opposition, since it means possibly commandeering from the rates of those districts.

Then as to the existing municipal undertakings in London itself,

then as to the existing municipal undertakings in London itself, the proposal that they must in future carry on their business of electricity supply subservient to the new electricity authority, naturally makes these also into enemies even outside other points.

Further, the Councils who own no electricity undertaking, and who have always resisted municipal trading, naturally are violently opposed to this thinly disguised scheme of municipal trading, which has all the disadvantages but none of the advantages, namely, that its losses must be paid out of the rates without any of the benefits of exclusive ownership and exclusive profits.

namely, that its lesses must be paid out of the rates without any of the benefits of exclusive ownership and exclusive profits.

Then as to the companies. It is only natural that these should strenuously oppose. They have expended so many millions of capital on the strength of the existing Acts and Provisional Orders. The London County Council now proposes either to take these over under entirely unsatisfactory conditions, or else to domineer their working and possibly authorise competition.

Then as to the ratepayer and public generally. The proposal to embark on a scheme ultimately involving, say, 40 to 50 millions in which the security of the rates plays a great part, naturally, at this time of national stress, they view as an entirely unwarranted risk.

It would indeed be interesting to know what individuals are really in favour of the scheme, except the engineers who have pre-pared it and a small proportion of the Electricity Committee itself, and possibly a very meagre sprinkling of London County Council members.

members.

Balancing up all the foregoing facts, it certainly seems very unlikely that the Council will proceed. They would have to say to Parliament that nobody wanted the Bill, that it was supported very lukewarmly in their own Council, and that there was no immediate necessity at the present moment for floating such a colossal financial scheme, and that the only good they could promise for a large number of years is the possible small reduction in the cost of electricity, and this is only in certain districts and to certain people.

certain people.

It certainly seems unfortunate that the early good promise which was given when the London County Council first undertook to formulate a scheme has reached this stage of fiasco. One factor in it certainly is that the London County Council Electricity Committee proceeded somewhat too independently and rode roughshod without precitied consultation over the interest and to shod without practical consultation over the interests of existing undertakings. This certainly was most markedly so in the case of municipal undertakings, and these from the very first have protested against the way in which the Council ignored them when formulating the scheme. Probably the same line of procedure elsewhere has resulted in this wholesale opposition.

Londoner.

Over-Pressure Protective Gear.

In some articles of mine on "Over-Pressure Protective Gear for In some articles of mine on "Over-Pressure Protective Gear for High-Tension Circuits," which you recently published, I drew attention to the off-repeated fallacy that the horn gap discharger tended to produce over-pressures on breaking the circuit. Is pointed out that not only was this not the case, but that, on the contrary, nearly all other forms of gap, such as the electrolytic and the Giles valve, were much more likely to cause pressure rises, although generally credited with opening the circuit at zero current, in the same way as an oil switch.

Some tests have recently been published by Dr. Linke (E.T.Z., 1914, Part 27), which I had not seen when writing, and these so fully confirm my conclusions that I think it may be of interest to allude to them. Oscillographic and other methods were employed for measuring the rises of pressure which occur on closing as well

for measuring the rises of pressure which occur on closing as well as on opening a circuit. Both a horn break and an oil break were tested in this way.

One typical experiment may be cited. In this case a low-tension inductive circuit carrying 1,000 amperes was opened by the blowing of a fuse across the gap. In the case of the horn break, the pressure rose to twice the normal, whereas with the cil break the rise was to no less than 50 times the normal.

The author points out that a pressure rise depends, more than anything else, upon the rapidity with which the current is broken and that, consequently, it is far safer to break the circuit at a horn gap, with its gradually lengthening arc, than by means of any form of quenching gap.

I would add that, even if it could be conceded that a particular form of the principle of the p

form of gap did actually open the circuit at the instant of zero current, it does not by any means follow that the stored energy (i.e., magnetic) is also zero at that instant, and unless this is the

case a sudden break will cause a serious rise of pressure.

In a further series of experiments, a 10,000 kw. high-tension generator was short-circuited at a horn gap. An oscillogram shows that the pressure across the gap falls to zero, and then gradually increases to the normal as the arc lengthens and breaks, The entire process occupies only a few cycles, and the smoothness of the voltage curve is remarkable. On repeating the experiment with an oil break switch, the current was found to fall suddenly to zero, with the result that severe over-pressures were set up, and the arc was re-started across the gap a few cycles later.

The above experiments seem entirely to confirm the conclusions

given in the articles in question, viz., that the horn gap breaks the arc so gradually that no over-pressures are produced, whereas with those forms of gap which break the circuit rapidly the reverse

is found.

I may add that since writing these articles, I have received some instructive statistics from one of the largest supply companies, having a very extensive E.H.T. underground system (the name of which, I am, unfortunately, not at liberty to mention) and which is equipped with a number of Brazil resistances and horn gap dischargers. Up to the end of 1913, these gaps were set to spark across at 50 per cent. above normal pressure to earth. In January, 1914, the settings were reduced to 30 per cent. above normal, with the interesting results given in the following table which shows the number of discharges recorded, as well as the number of breakdowns which occurred to the end turns of the motor-generator sets. motor-generator sets.

Year.	No. of Year, breakdowns.				•	Discharges recorded.		
1911	•••	•••	5	•••	•••	•••	6	
1912	•••	•••	6		•••	•••	14	
1913	•••	•••	11	•••	•••	•••	10	
1914 to	October	lst	1	•••	•••	•••	70	

It will be seen that the breakdowns, which in 1913 with the 50 per cent. settings amounted to 11, were reduced to 1 for the first nine months of 1914, a reduction to practically one-tenth of the former number. At the same time the discharges recorded increased from 10 to 70, showing conclusively, I think, that the reduced number of breakdowns was entirely due to the arresters.

Kenelm Edgcumbe.

January 11th, 1915.

Individual Driving of Looms.

In the "conclusion" of the abstract of Mr. Crowley's lecture before the Halifax Textile Society given in your issue of the 1st inst., it is stated:—"It is exactly four years since experiments were carried out which led to the putting down of the first large individual driving installation in this country—that of 800 motors in the shed of Messrs. Frears, Lord & Brother, Bradley Fold. When the order for this pioneer plant was placed only one British firm in the shed of Messrs. Frears, Lord & Brother, Bradley Fold. When the order for this pioneer plant was placed, only one British firm could manufacture loom motors, and that firm got the order." A similar misstatement to that at the beginning of the above quotation appeared in the Manchester Guardian some two or three years ago, and the Westinghouse Co. then correctly pointed out that prior to the Frears, Lord installation they had completely equipped and put to work an individually driven shed for Messrs. Edward Hibbert & Co., of Hyde, all the apparatus having been manufactured in Lancashire. Mr. R. Blackmore, of Stalybridge, was, I believe, the consulting engineer. This being so, Mr. Crowley's second statement is obviously incorrect, since the Westinghouse Co. were not responsible for the Frears, Lord equipment. equipment.

Weaver.

The City Guilds' Electrical Examinations.

The examinations conducted by the City and Guilds of London Institute in all branches of electrical engineering work constitute an annual event of some importance in the electrical world; the more so as considerable developments take place in nearly every

brauch year after year.

This being so, it is surprising to find that most of the electrical journals entirely ignore these examinations; and in so doing we venture to suggest that they miss "matter" that would be of great

interest to various sections of their readers.

Surely more than half the readers of a journal would be interested to know the nature and scope of the year's questions appertaining to their particular branch of work; and the publicity would certainly help to increase the number of candidates year by year. There is need, we believe, of encouragement in this direction. direction.

The perusal of carefully set examination questions will often convey valuable points to the reader; and perhaps a little tempered editorial criticism of certain of the questions would not be amiss

when the opportunity arose.

The examiners' reports on the results of their respective examinations are quite interesting matter; and the successful efforts of those examinees who have distinguished themselves by gaining medals and prizes should be noted as a matter of course.

In brief, we would submit that we do not make enough fuss of our technological examinations.

A. P. Lundberg & Sons.

London, N., January 11th, 1915.

A.C. v. D.C. for Lighting.

I note in the "Correspondence" columns of your issue of January 8th, under the heading of "A.C. v. D.C. for Lighting," a letter from "Ex-Gas." I would refer him to an article which was published in your paper describing a similar lighting scheme at Messrs. Elliot Bros. works at Lewisham, which is, in my opinion, one of the most successful examples of works lighting that has ever been carried out. Though I advised on the general lay-out of the scheme, I am certain that my judgment in this matter is not in any way prejudiced, as I have had every opportunity of examining similar schemes which have been carried out on the direct-current system, and have not been so effective owing to the high caudle-power and fragility of the lamps necessitated by the higher voltage.

Havdn Harrison.

[The article appeared in our issue of July 24th, 1914, p. 141.— EDS. ELEC. REV.]

OUR LEGAL QUERY COLUMN.

"O. H." writes: "I have a recollection of having read a report of a case in your paper connected with a supply of electricity being given outside the area of supply covered by a 'Provisional Order,' or rather the supply was given at some point within the area, but the electricity was actually used outside. The decision, as I recollect it, was that the supply was being given outside the area of supply and was illegal."

".* There is no case in which it has been decided that the use of electricity supplied within, but consumed outside, an area is illegal. It has, however, been held that gas cannot be so used. By the Metropolis Gas Act, 1860, Sec. 6, the limits of each of the gas companies then supplying the metropolis were defined, and in the result, each company enjoyed a practical monopoly in its own district. One of these companies, at the request of a railway company, placed a meter on a part of a railway station lying within the gas company's limits, and through it supplied gas to other parts of the premises situated outside the company's limits, and within the limits of another gas company. The Court of other parts of the premises situated outside the company's limits, and within the limits of another gas company. The Court of Appeal held this to be lawful on the ground that the sale and delivery of the gas took place at the meter; but the House of Lords reversed this decision, holding that the gas was supplied where it was consumed, and therefore that the company were transgressing their authorised limits (Gas Light and Coke Co. v. South Metropolitan Gas Co. (1889) 62 L. T. 126). This decision was followed in the case of a water company, and it is conceived that it would also be followed in the case of electricity. It is important to note, however, that by Sec. 6 (1) of the Electric Lighting Act, 1909, a supply may now, by leave of the Board of Trade, be authorised outside the area of supply.

Rail Manufacture in Australia.—A Reuter dispatch from Adelaide, dated January 9th, states that the first shipload, comprising 2.800 tons, of iron-stone from the huge deposits of Iron Knob has left Port Pirie for the Broken Hill Proprietary Co.'s iron and steel works at Newcastle (N.S.W.). It is expected that the works will be open in March and that rails will be manufactured by May.

EXPENDITURE UNDER ELECTRICAL PRIVATE BILLS.

The following information is contained in the deposited estimates in connection with the Private Bills for the coming session or in the Bills themselves so far as they concern electrical undertakings:-

Dewsbury Corporation (Mr. H. Dearden, bordugh engineer).—Purchase of land, £400; building tramways and omnibuses depôt, £7,135; construction of tramways, £8,390

London County Council Tramways and Improvements (Mr. G. W. Humphreys, engineer).—Tramways, £96,700; reconstruction of Whitchapel High Street terminus, £2,500; reconstruction of Tower Bridge Road to Lower Road line, £68,000; street widenings and improvements, £73,500 240,700

Aberdare Urban District Council (Mr. S. Sellon, engineer).—Construction and equipment of tram-ways and tramroad, £43,752; installation of railless traction and reversing apparatus and plant, £5,906; provision and equipment of motor omnibuses, £8,500; street works, £3,600; lay-out of recreation ground, £2,600; land and buildings,

Metropolitan District Railway (Mr. A. R. Cooper, engineer).—Construction of 1 furlong 3.35 chains of single line (including £47,740 for land, build-

Dunfermline and District Tramways Extensions (Mr. C. Don, engineer).—Construction of eight sections of tramway, of which the longest is 1 mile, 2 furlongs, 3.61 chains, double throughout 48,898

Edinburgh Corporation (Mr. A. H. Campbell, borough nburgh Corporation (Mr. A. H. Camppen, borough engineer).—Construction of 4 miles, 6 furlongs, 7.10 chains of tramway, £89,009; erection of tramway shedding and depôt and tramway leads into same, £7,500; street widenings and other works, £20,154; land and street widenings, £45,406 162,129

Sheffield Corporation (Mr. C. F. Wike, engineer, Mr. A. R. Fearnley, manager of tramways).—Construction of 4 miles 4.9 chains of tramway, £10,366; construction of 1.3 chain tramway, £1,165

Rhondda Urban District Council (Mr. E. Hazeldine Barber, engineer).—Construction of 2 miles 5 furlongs odd of tramway 25,568

Rotherham Corporation (Mr. E. B. Martin, borough engineer).—Streets, £4.311; tramway No. 1, £4.311; tramway 1A, £509; tramway No. 2, 5 miles, 2 furlongs, 6.92 chains, mostly single line, £49,537; alterations of levels of roads, £341

South Shields Corporation (Mr. L. Roseneare, borough engineer, Mr. W. Tuke Robson, tramways manager).—Tramways

Sunderland Corporation.--Tramway over reconstructed Wearmouth Bridge 712

Stalybridge, Hyde, Mossley & Dukinfield Tramways and Electricity Board (Mr. R. Blackmore, engineer).—Tramway No. 1, 1 mile, 1 furlong, 6.70 chains, £11,625; No. 2, 1 mile, 7 furlongs, 9.60 chains, £17,860; No. 3, 1.20 chains £166; No. 4, 1 mile, 3 furlongs, 6.50 chains, £12,376; No. 5, 1.40 chains, £183; No. 6, 1 mile, 5 furlongs, 0.60 chains, £15,069

London and District Electricity Supply (Mr. G. W. Humphreys, engineer, L.C.C., Messrs. Merz & McLellan, consulting engineers).—Railway siding (Work 6), £2,944; railway siding (Work 7), £2,464; works other than railway sidings, £270.100 £270,100 275,600

coln Corporation.—Provision of trolley vehicles, £10.200; electrical equipment of trolley vehicles, £5,500; omnibuses, £10,800; construction of tramway shelter, £2,300; construction of buildings, and purchase of plant and machinery in connection with extension of electrical generating station, £22,000 £43,000

WAR ITEMS.

Telegraphs at the Front.—The Times recently published a letter from an officer regarding the Field Telegraphs, or Signal Service, as it is now known, from which we quote the following:

"Most of the important towns in the North of France, and also

London and Paris, are in direct touch with General Headquarters. These are called the main lines of communication, and over their wires day and night passes a continuous flood of traffic for the wires day and night passes a continuous food of trame for the hospital bases, ordnance, remount and store depôts. From General Headquarters radiate wires to the various army corps headquarters, and again, each army has its communications to the divisions, which, further, have wires right up to the brigades. It will thus be seen that in the space of a few minutes the War Office is fully and clearly informed of what is going on in the firing line. In fact, were the lines joined straight through it would be possible to hear the roar of artillery and the bursting of shrapnel in St.

Martin's-le-Grand.

"As the tide of battle turns this way and the other, and head quarters are constantly moving, some means have to be provided to keep in constant touch with General Headquarters during the movement. This emergency is met by cable detachments. Each detachment consists of two cable wagons, which usually work in detachment consists of two cable wagons, which usually work in conjunction with one another, one section laying the line whist the other remains behind to reel up when the line is finished with the division is ordered to move quickly to a more tactical position. The end of the cable is connected with the permanent line, which communicates to Army Headquarters, and the cable detachment moves off at the trot; across country, along roads, through villages, and past columns of troops, the white and blue badge of the Signal Service clears the way. Behind the wagon rides a horseman, who deftly lays the cable in the ditches and hedges out of danger from heavy transport and the feet of tramping infantry. man, who deftly lays the cable in the divones and nedges out or danger from heavy transport and the feet of tramping infantry, with the aid of a crookstick. Other horsemen are in the rear tying back and making the line safe. On the box of the wagon sits a telegraphist who is constantly in touch with headquarters as the cable runs swiftly out. An orderly dashes up with an important message: the wagon is stopped, the message dispatched and on they go again.
"At Le Cateau the situation was so desperate that signal com-

panies were sent to the trenches to assist the infantry in repelling

panies were sent to the trenches to assist the infantry in repelling a heavy attack. For this piece of work we were highly complimented by General Smith-Dorrien, who, at the same time, expressed his great satisfaction at the way in which his communications had been established throughout the campaign.

"Telegraphists are often left on duty in the trenches and lonely farmhouses, chateaux, &c., close to the firing line, and I leave it to your imagination to picture how difficult it is to concentrate one's mind on the signalling and reception of important messages while the air is filled with the deafening roar of artillery and the screaming and bursting of shells. Wireless telegraphy, of course, plays an important part in this war, most of the larger aeroplanes being equipped with apparatus, by which means they swiftly communicate important observations to headquarters. The Germans also make elaborate use of this system."

Board of Trade Electrical Exchange Meeting.—We have

Board of Trade Electrical Exchange Meetings.—We have referred on previous occasions to the "Exchange Meetings" organised by the Commercial Intelligence Branch of the Board of Trade for the purpose of bringing before manufacturers samples of goods manufactured in Germany, and placing them in touch with purchasers of such products. The object of these meetings is, of course, to assist British manufacturers to capture trade that has hitherto been in German and Austrian hands, and last week the meeting was devoted to the electrical accessories trade. A the meeting was devoted to the electrical accessories trade. A collection of samples had been got together, not, perhaps, imposing in magnitude, but representing a great variety of articles, and in the aggregate a still greater volume of trade—for a single small sample may stand for an import value of thousands of pounds per annum. The samples were all labelled for reference, and many of them bore prices, which seemed in many cases absurdly low. It would be exceedingly interesting to set alongside this collection a similar display of British-made articles with prices attached; this, however, though enlightening to the inexpert, would be superfinous to the specialists in particular branches, who have the British prices at their fingers' ends, and are able to effect comparisons without such aid. While many of the items exhibited were of the character commonly understood to be items exhibited were of the character commonly understood to be implied by the phrase "made in Germany," it cannot be denied that others were of high-class manufacture, and in some branches, such

others were of high-class manufacture, and in some branches, such as medical apparatus, glassware, enamelled iron shades, &c., the Germans have hitherto had it all their own way.

There was a great variety of porcelain parts, fuse-blocks, ceiling roses, insulators and similar accessories, which appeared to be of good quality and finish. Many lampholders and other brass goods were shown, which did not impress us favourably. The samples of insulated wires and cables were in no way representative of the large imports under this head. Large globes, well glasses, ornamental glass shades, and opal or opalescent glassware made a munch better impression, and there was a small exhibit of are lamp better impression, and there was a small exhibit of arc lamp carbons which stood for a very big trade. Specimens of wood pateras, base-boards, &c., also probably signified a great deal more than might appear, as large quantities of woodwork have been imported from the Continent in the past.

Bell pushes and pressels and small bell switches were shown in variety of patterns; many of these were of poor quality, but

a variety of patterns; many of these were of poor quality, but some had handsome cast brass covers. A few electricity meters and small volt and amperemeters, small motors, magnetos and fans reminded us of the very large import trade in these items; near them was a collection of electric toys, more or less rubbishy. A time switch made by ingeniously modifying a common alarm clock was noticed, amongst samples of air blowers for hair drying, electric irons and kettles, motor-car lamps and ignition plugs, and one neat little iron in a leather case which would make a "useful present" to a lady. Many patterns of cheap electric bells and indicators, a few telephones and parts, pocket lamps and portable bull's-eye lamps, conclude the list—though perhaps by no means least in importance as representing a considerable annual value. It will be noticed that in many instances similar articles have long been manufactured in this country, and the only question in such cases is how to get down to the German prices without sacrificing quality; in other instances, pocket lamps and glassware, for example, the trade has been almost entirely foreign, and strenuous efforts are being made by British firms to fill the gaps.

efforts are being made by British firms to fill the gaps.

We hope that the result of the efforts of the Board of Trade will be the development of new manufactures in this country and the extension of existing businesses; manufacturers and repre tives of wholesale houses who were not able to be present need only communicate with the Commercial Intelligence Branch of the Board in order to obtain the fullest possible assistance within its power, as the Board is anxious to leave no stone unturned to pro-

mote the national interests.

We extend a cordial invitation to manufacturers and their representatives to send us any observations that they may feel able to make as a result of their inspection of the exhibits. The

publication of the views of experienced minds regarding these articles would, we feel, be most valuable to the British electrical industry at the present important juncture in its history.

An Urgent Appeal for Assistance.—We wish to appeal to our charitably disposed readers on behalf of a very deserving couple who are in sore straits. For some time past they have been enabled to keep a roof over their heads through the generosity of one of the electrical benevolent funds, but circumstances have now arisense which make assistance of other kinds necessary. The man who to keep a roof over their heads through the generosity of one of the electrical benevolent funds, but diroumstances have now arisen which make assistance of other kinds necessary. The man, who was formerly a telegraph instrument inspector, lost his eyesight some years ago, and all he can do is to earn a trifle by typewriting or knitting. His wife is a Swiss, who speaks French and English well, and is a hard-working woman prepared to take in lodgers, and so keep a home together. Belgian refugees who were with them have returned to Belgium, and they have no means of meeting rent charges. It occurs to us that there may be some of our readers who could recommend them lodgers (the house is described as a pleasant one and is situated in Stockwell), or who would be prepared to place with them, and pay the charges for, some respectable Belgian refugees. We believe the latter course will commend itself as an excellent way of "killing two birds with one stone," as the doctor said when he visited two patients in a remote neighbourhood. We shall be pleased to put any reader in touch with the parties referred to, or communications may be addressed to Mr. F. B. O. Hawes, of the Electrical Trades Benevolent Institution ('Phone No.: Brixton 1833).

Trade Follows Travel,—It is stated that the ss. Finland has been chartered by the Fidelity Trust Co., of Baltimore, and will sail on January 27th for a cruise completely encircling South America, with the object of establishing better trade relations between U.S.A. and South America. The Financial Times in discussing the movement, quotes the president of the New York Central Line, to the effect that "trade undoubtedly follows travel."

between U.S.A. and South America. The Financial Times in discussing the movement, quotes the president of the New York Central Line, to the effect that "trade undoubtedly follows travel." He speaks, of course, as a railway authority, but he merely says what we have urged upon the notice of British manufacturers scores of times, and many of them have testified to its absolute accuracy in recent years, as they have experienced better business as the result of their efforts. There will undoubtedly have to be as the result of their efforts. There will undoubtedly have to be much more of the most capable British travelling to all quarters of the globe in the interests of our industries directly. We hope that those destined to fill such engagements will not overlook the necessity for being prepared with linguistic and other qualifications in good time. We, of course, do not suggest that "travel" is the only matter of mportance—there are many others, but this is one of the things that will be needed, whatever developments take place in general trade policy.

An Appeal.—The Belgian Chamber of Commerce in London (Incorporated), 24, St. Dunstan's Buildings. St. Dunstan's Hill.

An appeal.—The Beigian Chamber of Commerce in London (Incorporated), 24, St. Dunstan's Buildings, St. Dunstan's Hill, E.C., appeals to British manufacturers and merchants for support. Since the beginning of the war its tack has naturally become much more arduous than in previous years. After the cessation of hostilities the Chamber will have very important duties to perform in helping the commerce of the two countries together manufacturers and buyers of goods and in many bringing together manufacturers and buyers of goods and in many other ways. But we are informed that the Chamber finds great difficulties in carrying out its duties through lack of funds, as the demand has been greater than ever before and Belgian supporters are unable now to send their usual remittances. Applications for Applications for

are unable now to send their usual remittances. Applications for membership and contributions may be sent to the general secretary, Mr. P. Dorchy, at the above address.

German Tires.—At a recent meeting of the Halifax Tramways and Electricity Committee of the Halifax Corporation, Alderman Whitley Thompson directed attention to a charge made by Liga Tires, Ltd., of \$56 for tires. He understood that this was a German firm, and, therefore, he supposed that cheques would not be issued to the concern until after the conclusion of the war. be issued to the concern until after the conclusion of the war.

Ald. Spencer explained that Liga Tires, Ltd., was a London firm
which existed for the circulation of German tires. He believed
the company was now in liquidation, and, as the Committee had
a large claim against the firm, the cheques would not be handed
over to the liquidator until that liability had been met.

Policat Floatricians and National Policator The electrical

Belfast Electricians and National Relief.—The electrical department of Messrs, Harland & Wolff, shipbuilders, Belfast, is well represented in the list of contributors from the various departments to the National Relief Fund.

Old Briars Wanted.—We read in a Scottish newspaper that the Glasgow tramways Department are collecting pipes for the soldiers at the front and in the hospitals abroad, and also for the men of the Navy. "Up to date 31,409 pipes have been received, most of these being old briars. This number is very small compared with the number required, as, in many instances, one pipe has to satisfy many smokers. The tramways staff are still prepared to receive at 46, Bath Street, Glasgow, any pipes, and have them thoroughly cleaned and dispatched to the front."

Oldham Tramway Contracts.—The Town Clerk of Oldham

has informed the Tramways Committee that the High Court, on the has informed the Tramways Committee that the high Court, but he hearing of a test case for the recovery of the price of goods sold and delivered, has held that the plaintiff company incorporated in England was entitled to recover payment, although the shares were mainly held by alien enemies. He added that he had settled the action of the Polack Tyre Co. by payment of the debt without costs. The Tramways Committee has approved this action, and has instructed the horsest transverse to pay the accounts due to the instructed the borough treasurer to pay the accounts due to the Tudor Accumulator Co., Ltd., Dukinfield, which had been held

Relief Allowances to Municipal Employés.—The Rochdale Tramways Committee has been considering the case of a man who in June last was allowed to go on the tramcars to learn the duties of a conductor; he was not actually employed and receiving wages when the war broke out, nor for some time after. Now he has joined the Colours, and the question the Committee has had to decide is as to whether he is entitled to the half-pay granted to men enlisting who were on the staff when war broke out. By a majority of one, it has been held that he is entitled to the halfpay.

Cable Manufacturing at Perivale.—At the meeting of the Greenford District Council last week, Mr. L. Roberts wanted to know whether the firm of Messrs. Geipel & Co., whose plans for the erection of works at Perivale hal been recently passed by the Council, was a German one. He understood that before the war the firm got its cables from Germany, but the intention now was to manufacture them at Perivale. The surveyor replied that the head of the original firm was naturalised in 1848. That gentleman was now dead, but he (the speaker) had made inquiries and was of opinion that the firm was "all right." Ultimately it was agreed to enter a minute to the effect that Mr. Roberts had raised a question on Messrs. Geipel's plans, and that the chairman had ruled the matter out of order.

Trade with Australia.—The Agent-General for New South Wales (123-5, Cannon Street, E.C.) published the following advertisement in the Times the other day:—"Notice to British firms. Manufacturers and others wishing to extend their business in New South Wales are invited to make known their wishes to the and to whom all communications should be addressed. The forms when received will be sent to Sydney, where proper inquiries will be made as to the openings for placing the manufactures in which applicants are interested, and the result will be made known to inquirers."

The Council of the Sydney Chamber of Commerce has appointed

The Council of the Sydney Chamber of Commerce has appointed a Sub-Committee to consider the practicableness of inaugurating a movement to take advantage of the suspension of trade with the enemy countries, and to develop such trade within the Empire and with the other allied nations.

Rawtenstall Employes with the Colours.—Nearly 40 per cent. of the staff at the Rawtenstall Corporation electricity works and about 25 per cent. of the tramwaymen have joined the Colours.

Personal.—Mr. Frank P. Lacey, consulting engineer, has been given a temporary commission in the Royal Garrison Artillery, and the Infirmary Committee of the Salford Board of Guardians has decided to accede to a request by him that on the termination

of the war he shall be retained as electrical adviser.

Mr. R. H. Klein, hon. sec. of the Wireless Society of London, although having a name with a somewhat Germanic sound, is a Belgian and a naturalised British subject. He is a Licenciate in Consular Sciences of Antwerp.

Mr. M. C. Shepherd's friends will be interested to know that

he is Corporal Instructor in the 14th (Service) Battalion of the Bifle Brigade, in training at Southend-on-Sea. Mr. Shepherd has long been an energetic supporter of National Service, and a promoter of the National Reserve, and has evidently seized the opportunity of bearing his share of the burden. Business will be carried on as usual in his absence.

on as usual in his absence.

Col. H. S. Holt, a former partner of Mr. James Swinburne, in Swinburne & Co., has been gszetted major in the Expeditionary Force, and has left for the front. He is attached to the Royal Flying Corps, for the purpose of instructing them in the fitting and use of his reconnoitring parachutes and other inventions.

Mr. John Ridley, who was amongst the survivors of the Formidable disaster, was the ship's chief electrician, and was formerly on the staff at the electricity works at Carlisle, where his home is. He entered the Navy about eight years ago, and prior to his transfer to the Formidable was on the H.M.S. Commonwealth. Before he was rescued he was 21 hours in an open boat. He is safe and well at Lyme Regis. safe and well at Lyme Regis.

Mr. A. H. Campling, son of Mr. Frederick Campling, managing director of Messrs. Joslins, Ltd., electrical engineers, Colchester, has been gazetted second lieutenant in the 12th Service Battalion Essex Regiment. Mr. Campling has for several months been serving at Epsom with the Public Schools and Universities Corps.

It is stated that Private Lonsdale's death sentence has been commuted by the Court of Appeal to one of 20 years' imprisonment, but it is understood that he will be released with the other British prisoners at the end of the war.

The Electrical Engineering and Equipment Co., Ltd., inform us that they have three directors—Mr. B wlby, Mr. Higgins and Mr. Leven. Mr. Bowlby's son is a captain in the Norfolk Regiment, and has been missing for three months; Mr. Higgins is a captain, and has been at the Front for some time, whilst Mr. Leven's two sons are both in the Army, the younger one, Lieutenant Charles Leven, having recently been invalided home. In addition, there also a number of members of the staff serving in the Army.

Mr. S. W. Carty has just resigned his position as overhead superintendent to the Liverpool Corporation tramways department, and has obtained a commission as a lieutenant in the Army Service Corps Motor Traction Department, where his duties are to control the workshop units attached to the anti-aircraft guns. Mr. Carty held a similar position with the Newcastle Corporation before going to Liverpool, and in both cities he has been secretary to the local Automobile Clube.

Roll of Honours.—Private W. Macdonald, of the Mechanical Army Service Corps, Highland Division (T.F.), has died at Bedford, aged 20. He was employed as an apprentice electrical engineer with Messra, Millar Bros., Aberdeen.

Mr. Joseph Dunn, who was for some years employed as a conductor on the Salford Corporation tramears, has been killed in action.

BUSINESS NOTES.

Consular Notes.—BAGDAD.—In his report for 1918 on the trade of Bagdad, the British Consul-General gives the total value of machinery imported as £169,000, of which £106,000 came from the United Kingdom. This represents a total increase of 62 per cent. over the value during the previous year, the advance being partly due to the inclusion of some railway construction material. Nevertheless, there has no doubt been a real and substantial improvement. As in preceding years the bulk of and substantial improvement. As in preceding years, the bulk of the machinery, consisting of irrigation plant, was of British manufacture.

KOBE.—According to the British Consular representative, there was a large increase in machinery imported at Kobe during 1913, the total being approximately £380,000 more than in 1912. item forms, he says, one of the most satisfactory features in the import returns, and is, moreover, one that must eventually increase in value as industrial development progresses, though the existing depression in trade, and other causes, will probably prevent any notable advance in the immediate future. There is no doubt that the Japanese spinning industry has a bright prospect before it, and that the fast-growing markets in China and Corea will be the cause of still further additions to machinery importation.

As regards electric motors, alternators, &c., the main part of the business was divided about equally between the United Kingdom, United States, and Germany. The completion of the Ujikawa hydroelectric works has to some extent increased the demand for motors for running small power plants. The construction of electric railway systems continues, but most of the orders for equipment appear to have gone to the United States and Germany.

Dissolutions and Liquidations.—The Electro Steel FOUNDRIES, LTD., Booth Street, Darlaston.—Under a compulsory winding up order made against this company, the statutory first meetings of the creditors and shareholders were held on January 8th, at the Carey Street offices of the Board of Trade, Lincoln's Ian, W.C., Mr. H. E. Burgess, Official Receiver, pressiding. The retition to wind up, was ledged by Messes Tunbridge to Co.

sun, at the Carey Street omess of the Board of Trade, Lincoln's Inn, W.C., Mr. H. E. Burgess, Official Receiver, presiding. The petition to wind up was lodged by Mesers. Tunbridge & Co., solicitors, Birmingham, on behalf of Mr. Alfred Ernest Owen, The Lawn, Streetley, near Sutton Coldfield. A statement of affairs was presented showing liabilities £3,200, assets valued at £5,000, representing unpaid calls on shares £7,500, and as regards contributories, a deficiency of £3,200.

The company was incorporated as a private company in June last with a nominal capital of £45,000 to carry on the business of iron, steel and brase-founders, casters, moulders, and metal-workers, the object being to work a particular electrical process of steel manufacture which had been successfully worked in Germany. The promoters were Mr. Francois Victor Bernand, electrical engineer, of Houldsworth Wood, who was to act as managing director for six years, at a salary of £500 per annum, and Mr. Alfred Ernest Owen, the petitioner. The issued capital was £30,000, the whole of which was subscribed for in cash and called up to the extent of 5s, per £1 share. An agreement was entered up to the extent of 5s. per £1 share. An agreement was entered into on July 22nd, 1914, between the Rheinsche Electrostahl Werke, of Bonn, on the Rhine, Mr. Owen, and the company, whereby the German Co. agreed to supply instructions and drawings for laying down plant for the manufacture by a special process of electric steel castings; to supply certain Electrostahl furnaces, and to apply for the allotment of £10,000 shares in the company. Mr. Owen being the proprietor of land at Darlaston agreed to sell a certain part thereof to the company and to apply for the allotment of £20,000 shares, which were issued as to £17,000 to Mr. Dernand. The outbreak of hostilities made it impossible ES,000 to Mr. Bernand. The outbreak of notifities made it impossible for the German Co. to carry out the agreement, and the company is unable to enforce payment of the call upon them in respect of the £10,000 shares. Mr. Bernand issued a writ against the company for salary as managing director, and proceeded to judgment, whereupon Mr. Owen took the necessary steps to protect himself, and presented the petition to wind up the company. The failure

is attributed by its officials to the European crisis, whereby the persons connected with the German Co. became alien enemies, which prevented the objects of the flotation being carried into effect. The Chairman remarked that this was essentially a case for the parties to come to an amicable settlement, seeing that the general public were not involved in the proceedings, and he counselled a friendly meeting, at which, if necessary, he would give them any advice or assistance. Mr. Owen and Mr. Bernand appeared to endorse that view, and by general consent the liquidation was left in the hands of the Official receiver.

THE GENERAL ELECTROLYTIC PARENT CO, LTD.—This company is winding up voluntarily with Mr. J. Barron, of Middlewich, as liquidator. A meeting of creditors was held on January 14th.

THE DRY GAS ELECTRIC FIRE EXTINGUISHER CO., LTD.—A meeting will be held on February 11th, at 109, Colmore Row, Birmingham, to hear an account of the winding up from the liquidator, Mr. H. Keeling. is attributed by its officials to the European crisis, whereby the

GRINDELL MATTHEWS WIRELESS TELEPHONE SYNDICATE, LTD.

—Liquidator (Mr. H. Woodburn-Kirby Bassishaw House, Basing-hall Street, E.C.) released Docember 16th, 1914.

MESSES. W. J. CLENT and J. R. HALLIWELL, flash lamp battery

makers and commission agents, 19A, Corporation Street, Manchester, who have traded as W. J. Clent & Co., have dissolved partnership. Mr. Halliwell is continuing the business under the style of Halliwell & Co.

Halliwell & Co.

Sending Receipts on Account. — In the City of London Court, on Thursday last week, before Judge Rentoul, K.C., in the case of Minchin v. Strausa, plaintiff, Mr. W. S. Minchin, 20, Hanover Square, claimed &8 2s. 6d. against the defendant, Mr. Julius Strausa, 22, Seething Lane, for the balance of £40 for trade goods supplied. Mr. Woodgate appeared for the plaintiff, Mr. Beechcroft for the defendant. Mr. Woodgate said that defendant disputed that goods to the amount of £40 had been supplied or work done and sent the plaintiff a cheque for £32 ls. 11d. "in full settlement of account." Plaintiff accepted the cheque, waited until it was cleared, and then wrote and said he did not accept the condition on the cheque, giving a receipt "on account."—Mr. Beechcroft said there was a bona fide dispute about the balance deducted, but defendant would not go into that now, as the time and trouble involved would be out of all proportion to the amount at stake. They had had three different accounts from the plaintiff. at stake. They had had three different accounts from the plaintiff.
Plaintiff could not retain the cheque, pay it in, and then say he
would not accept the condition attached to it. Plaintiff gave no would not accept the condition attached to it. Plaintiff gave no opportunity to the defendant to withdraw his cheque when he said he would not accept the condition. A cheque was not money, but a negotiable instrument for money. If a man did not accept the condition the only honest course was to give the defendant a chance to take back his cheque.—Judge Rentoul agreed that that would have been better, but plaintiff would have been out of the bulk of his money for some months if he had done that.—Mr. Woodgate urged that plaintiff was quite within his rights and within the legal decisions.—Judge Rentoul agreed and found for the plaintiff, with costs.

Catalogues and Lists.—The Sun Electrical Co., Ltd., Catalogues and Lists,—THE SUN ELECTRICALUO., LTD., 118-120, Charing Cross Road, London, W.C.—Two booklets: No. 264, a 12-page pocket pamphlet, in which are illustrations and prices of a new range of "Electric Cooking Apparatus de Luxe," especially for table use (kettles, water-heaters, grill, toaster, boiling-ring and irons); and No. 263, which is an 8-page priced publication showing a number of their registered designs of British-made fittings for half-watt lamps, the majority with opalescent globes, but two with Holophane glassware.

MESSES. MARPLES & LEACH, 26-30, Artillery Lane, London, E.C.—Eight-page stock list of C.C. and A.C. motors, dynamos and port-

Eight-page stock list of C.C. and A.C. motors, dynamos and portable electric tools in London ready for delivery.

MESSES. ELECTRIC INSTALLATIONS, LTD., 27 and 28, Martin's Lane, Cannon Street, London, E.C.—Folder relating to intercommunication telephones for business premises, and a list of installa-

munication telephones for business premises, and a list of installations supplied by the firm.

MESSES. J. H. HOLMES & Co., Newcastle-on-Tyne.—Pamphlet No. 37 gives particulars, prices, code-words, &c., for ironelad oilbreak switchgear for mining and sub-station work.

MESSES. A. P. LUNDBEEG & Sons, 477 to 489, Liverpool Road, London, N.—Ten-page pamphlet (No. S 24), containing very full and illustrated matter relating to their various types of ceiling roses—'Biflex," "Detachable," "Triflex," "Quadrufiex, "Multiflex," and "M.I.P." Prices are stated, and examples of their uses given.

The Edison & Swan United Electric Light Co., Ltd., of

THE EDISON & SWAN UNITED ELECTBIC LIGHT CO., LTD., of Ponder's End., have prepared some most artistic and effective transparencies for fixing to their customers' windows, show-cases, &c., in all parts of the country. Reproduction here would hardly do it justice—it requires to be seen printed in colour—but for the purpose for which it is intended it must be an excellent advertising

agent for Royal Ediswan drawn-wire lamps.

London, E.C.—Leaflet No. H 1,882 gives some particulars of the
"County" half-watt lantern with Holophane globe.

Bankruptcy Proceedings .- S. Brookes (The Netherton Tube Fittings Co.), tube fittings manufacturer, Netherton, Dudley).—Discharge suspended for two years, on December 8th,

GEORGE EDWARD HIPKINS, electrical engineer, 11, Bath Street, Dudley, appeared at the Dudley County Court last week for his public examination in bankruptcy. The liabilities were set down at £510, and the deficiency at £386. Debtor attributed his failure to "loss on picture palaces, loss on trading through the war, law costs, and interest on borrowed money." The examination was subsequently adjourned to close

Book Notices .--The Electrical Engineer's Diary for 1915. Edited by J. H. Johnson, London: S. Davis & Co. Price 3a. 6d.—Whilst the bulkier portion of this volume is certainly a 3a. 6d.—Whilst the bulkier portion of this volume is certainly a diary, interleaved with blotting paper, the remainder is a reference book containing a mass of useful information with regard to electricity supply and electric lighting, heating, cooking, and power. In addition to a collection of tables and data of general application, and the principal sets of official regulations, there are sections dealing with power station plant and management, illumination, and domestic uses of electricity, and a valuable set of tables on the power required for a great many industrial amplications of elecpower required for a great many industrial applications of electrical energy. A list of London streets in which electric mains are laid forms a unique feature of this publication, and a list of electricity supply authorities in the United Kingdom is included. Altogether it is a very creditable production, and should prove useful to a wide range of electrical men.

Magnets and Electric Currents. By J. A. Fleming, F.R.S. London: E. & F. N. Spon. Price 3s. 6d. net.—It is generally reckoned that electrical books are obsolete when they are, say, 10 years old, owing to the rapid march of progress; happy, therefore, are the publishers, and proud should be the author of one which, first published 17 years ago, can now be re-issued apparently without the least alteration except in the preface and the titlepage. In passing, we may point out that in both places it is referred to as the third edition; this is hardly correct, as it is, trickly greeking only the third dimension. Prof. Floring eteters referred to as the third edition; this is hardly correct, as it is, strictly speaking, only the third impression. Prof. Fleming states, in explanation of the absence of change, that the book "deals with the fundamental and elementary principles on which Electrical Engineering is based, and these are not subject to variation"; this is true in the main, but it is not advisable to go too far along these lines. For instance, nomenclature changes, and we do not now speak of "micrometres," but microns, nor are the abbreviations grm. and kgr. recognised; the weber as the unit of magnetic flux is not in general use, and the accepted value of the British thermal unit is not 779, but 778 ft. lb. The "modern two-pole dynamo" illustrated on p. 349 was modern 17 years ago, but, like most of the commercial apparatus illustrated, it is now ancient. We praised this book when we reviewed it in 1898; and—it was a good book.

The Kinematograph Year-Book, Diary and Directory for 1915

this book when we reviewed it in 1898; and—it was a good book.

The Kinematograph Year-Book, Diary and Directory for 1915 (London: Kinematograph and Lantern Weekly) is an interesting and useful volume, which, by its bulk, affords some indication of the extraordinary development of the new industry which has so quickly established itself amongst us; the directory alone occupies 100 pages, and includes particulars of the systems and voltages of electricity supply throughout the United Kingdom. Moreover, this is only the second issue of the year-book—yet it contains a mass of information on all matters connected the producers. The contains a mass or information on all matters connected with the picture play that does great credit to the producer. The industry may justly claim to be inseparably associated with elec-tricity supply, seeing that the electric arc is almost invariably used as the source of light, and the theatres are usually electric-ally lighted; we are therefore interested in its prosperity, which may be gauged by the fact that during 1914 500 new companies were registered and 300 new theatres were opened in Great Britain.

A large number of the establishments are called "Electric Theatres." The year-book contains a note concerning new electric lamps, and we regret to notice that the invention of the half-watt lamp is ascribed to Germany; this is wholly erroneous, the lamp having been developed entirely in the United States. The early work of Mr. R. W. Paul, the pioneer of the kinetoscope in this country, as well as of the kinematograph, is described, and the book is illustrated with numerous excellent half-tones from films, admiring which has prevented us from making further notes on the literary contents

Willing's Press Guide for 1915 has made its appearance. It is published at the popular price of one shilling, at 125, Strand, W.C. published at the popular price of one shilling, at 125, Strand, W.C. On the whole, it is a very serviceable directory, but it ought to be more accurate in its entry, in "Metropolitan Newspapers" section, relating to the date of an electrical contemporary's birth. "How to Pay for the War." By Wilfrid Stokes.—London: British Engineers' Association. 6d.

Announcement. - Messrs. Mossay & Co., Trade LTD., have removed from Horseferry Road to Queen Anne's Chambers, Westminster, where they are continuing their engineering business. As already announced, they have made arrangements with Messrs. Ransomes, Sims & Jefferies, Ltd., of Ipswich, for the manufacture to their designs, of electrically-driven vehicles. Under these arrangements Messrs. Mossay are also acting as selling agents for these vehicles in the United Kingdom, and all inquiries relating thereto should be addressed to them. The first series of chassis is already in hand, and early deliveries can be given.

Canada.—The Times states that an important new steel plant, owned by the Armstrong, Whitworth Co., of Canada, Ltd., is now in operation at Longuenil, opposite Montreal, in the Province of Quebec. About 200 workmen will be employed at the outset, under the supervision of experts from British works. For the present the company will confine its operations to the manufacture of high-grade crucible steel for machine tools.

Private Arrangements.—Redglo, Ltd., 647, Royal Private Arrangements.—REDGLO, LTD., 647, Royal Liver Buildings, Pier Head, Liverpool, and 34, Great Ancoats Street, Manchester, electrical stove manufacturers.—Pursuant to Sec. 188 of the Companies' (Consolidation) Act, 1908, a meeting of the creditors herein was held at Liverpool last week, when a statement of affairs was presented showing liabilities amounting to £548 and net assets estimated to realise £599, the estate disclosing an apparent surplus. It was reported that the company was formed 18 months ago, with a capital of nearly £1,000. The trading up to the present time amounted approximately to £855, while the sales of patents amounted to £1,500. It was explained that the greater portion of the loss was owing to the initial while the sales of patents amounted to £1,500. It was explained that the greater portion of the loss was owing to the initial expenses in the formation of the concern. The patentee, Martin, was at present on active service, and the business was being conducted by the liquidators, Mr. Ernest J. Walker, of Messrs, Lloyd Walker & Evans, and Mr. P. Hutchinson, a creditor. Mr. Hutchinson stated that he had several purchasers in view for the patents, and it was hoped that ultimately the creditors would receive 20s. in the £. It was decided that the matter should be left in the hands of the joint liquidators. The following are creditors: are creditors :-

Hutchinson, P. . . . Lloyd Walker & Evans . . . Winfane Art Metal Co. . . . Simpson, North & Co. . . . 20 20 22

Foreign Electrical Trade in 1914.—The Chamber of Commerce Journal, in the course of its trade review for last year, gives the following figures showing the course of the export and import trade in electrical goods for the eleven months ended November 30th, 1913 and 1914:-

EXPORTS. Electrical goods and apparatus (other than machinery and uninsulated wire) -1913. 1914. **British** £5,058 207 £2,833,330 Foreign Electrical Machinery— 176,670 220,719 24,873 tons. £2,076,092 29.679 tons. British £2,040,578 461 tons. Foreign ... ••• ... £86.495 £63,195 TWPORTS Electrical goods and apparatus (other than machinery and uninsulated wire) £1,431,771 £1,152,017 Electrical machinery 1.223.501 1.353.851 ••• 10,433 tons. 11,178 tons.

Trade Openings in Buenos Ayres.—With a view to increasing Italian exports to Buenos Ayres, the Italian Chamber of Commerce in that city has instituted an inquiry, and formulates the following list of articles for which there is a demand in the Argentine market:—Electric motors, dynamos, explosion engines required in electric stations, accumulators, malleable steel and iron tubes for internal wiring, with accessories, metal-filament lamps, and armatures for same, 220 and 240-volt current-breakers, and and armatures for same, 220 and 240-volt current-breakers, and general accessories for electric installations. The requisites for successful sales are: moderate price, æsthetic appearance, judicious advertising, choice of expert representatives having good clientèles and of good repute, having a knowledge of where to grant facilities for payment. The factors which have worked against foreign, and particularly Italian trade, have been lack of discernment in the ch of agents, smallness of the means placed at the agents' disposal, lack of initiative in the agent, and oftentimes lack of knowledge of the branch of goods handled, at times also too little liberty and too exacting contracts, too much exigence on the part of manufacturers and absence of facilities for payment. Packing and forwarding are governed by the article and the transport convenience available, and also the Customs regulations, which in some cases are fixed by weight and in others by number. Packing itself should fixed by weight and in others by number. Packing itself should be the object of special study, as upon it depends the good condition of the articles on arrival, and therefore of the higher or lower scale of cost. The conditions of payment usually exacted by German houses is 90 to 180 days in shipping documents, paid by bills drawn on German branch banks, without interest. As the effect of the war will be to paralyse for an indeterimate period the industry of many countries, and especially of Germany and Austria, the former hitherto enjoying a large share of Argentine trade, the present time affords an excellent opportunity for other countries to forward their goods and secure a footing in the progressive Argentine market.

Australian Tariffs.-Various representations were made to the Inter-State Commission in Melbourne recently for alterations in the tariff with respect to electrical apparatus. Mr. W. J. Mountain, secretary to the Melbourne Electric Supply Co., applied for a reduction of the duty on electrical incandescent lamps. These lamps (he said) were not made in Australia, though they provided the most hygienic light. The duty on them hindered their sale. Mr. F. W. Clements, chief engineer to the Melbourne Electric Supply Co., asked for a reduction of the duty on electric generators for direct coupling to steam turbines. Mr. James Wilson, manager ror direct coupling to steam turbines. Mr. James Wilson, manager of the British General Electric Co., Sydney, asked for a British preferential tariff of 10 per cent. on certain electrical appliances. There had been very serious competition to contend with (he said) from America and Continental manufactures. Continental manufacturers did not supply goods nearly up to the British standard.—Australian Mining Standard. Calendars and Diaries. — THE DIAMOND COAL-CUTTER Co., Wakefield.—A wall calendar with monthly slips has been issued. A Diamond cutter figures in the design.

From the Dussex Bitumen Co., of Empress Wharf, Bromley, E., we have received as usual a very presentable pocket diary with card and letter case, and insurance coupon. We are interested in the general information which it contains, especially where there are some "Things One Wants to Know." That it is copyrighted by Calling, clear two Danes which the Danes to Consent Control of the coupling of the Danes of the Calling. by Collins' clear-type Press relieves the Dussek Co. of responsibility, and the war exonerates both, but one of the things that one very much "wants to know" is that the income-tax is "1s. 2d. in the s." We certainly want to know that more than that "an airship going at 50 miles per hour would take 210 years to reach the sun from the earth," though there is some timely interest in the fact than an inch of rain means about 100 tons per acre, and far more in the inspiring statement that February is one of the driest months of the year. We congratulate the Dussek Co. on continuing to issue a meat acceptable meants acceptable meants.

ing to issue a most acceptable pocket souvenir.

From THE ELECTRO-MOTOR HIRING, LTD., of Greenmount Works, Halifax, there has come to hand a wall calendar with monthly slips. The design is a Union Jack in colour forming a background for five half-tone illustrations of Wright & Wood motors.

A very serviceable and clearly-printed calendar with monthly sheets for 1915 has been received from the Selson Engineering Co., LTD., of 85, Queen Victoria Street, E C.

Crane Contracts for India.—Amongst the Government

orders recently received by Messes. Pyne, Hughman & Co., engineers, of London and Calcutta, are the following:—

Thirteen 2-ton electric goods lifts for the new sheds now being erected by the Port Commissioners, Calcutta, north of the Howard erected by the Port Commissioners, Calcutta, north of the Howrah Bridge, amount of contract over £6,000. These lifts are being manufactured by Messrs. A. & P. Steven, of Glasgow, for whom the firm are agents. The Port Commissioners have also placed an order with the same firm for 11 2-ton electric roof cranes for the new sheds and jettles being built at Garden Reath, amount of contract over £12,000. These cranes are being manufactured by Messrs. Geo. Anderson & Co., of Carnoustie.

A repeat order has also been placed with Messrs. Pyne Huchman.

A repeat order has also been placed with Messrs. Pyne, Hughman and Co. for a further 19 electric oranes (13 semi-portal and six roof oranes). amount of contract over £24,000. The cranes in this instance are being manufactured by Messrs. John Grieve and

Co., of Motherwell.

Warsaw.--H.M. Consul reports that a local firm wishes to get into touch with United Kingdom manufacturers of electrical goods, such as dynamos, fans, lighting accessories, installation materials, telephones, bells, &c. The names can be ascertained at the Commercial Intelligence Branch of the Board of Trade, London, E.C., but further communications should be addressed to the British Consulate, Warsaw.

LIGHTING and POWER NOTES.

Aberdeen.-During November, 1,138,140 units were generated at the Corporation power station, an increase of 63,250 units compared with the corresponding month in 1913.

Argentina.—It is reported that the electric lighting Argentina.—It is reported that the electric lighting company has notified the Municipality of Mar del Plata of its decision to suspend the public lighting service at the end of the present month, owing to the Municipality having made no payment for the last 1½ years' service. The residents of Dolores are protesting against the excessive charges of the Italo-Argentine E.L. Co., and a technical inspector is to be appointed.

It is proposed to construct electricity works at Irigoyen (Santa Fé), which would also supply Barrancas, Disz and Casalegno.—

Review River Plats.

-The Parramatta Council has concluded a Australia.contract with the Parramatta Electric Lighting Co. for the lighting

of the town by electricity.

The Mount Lyell Power Co.'s hydro-electric scheme is now nearly completed. At the blower house at the smelters four electrically completed. driven turbo-blowers, each of 25,000 cb. ft. capacity, and two of 3,500 ft. capacity, have been installed, with satisfactory results

The Sydney Municipal Council has authorised the city electrical engineer, in view of the possible necessity for additional plant required to meet the demand for electricity in the winter of 1915, to prepare specifications for two 12,000-kw. turbo-generators and the boiler house equipment necessary to provide steam for one of these machines.

At Wollongong (N.S.W.) the installation of an electric plant at Mount Pleasant colliery is being proceeded with, and a transmission line for three-phase current is being erected. It is stated that in a few months there will be energy produced at this colliery far beyond its own needs, and the company will, no doubt, be prepared to supply outside consumers.—Tenders.

-STREET LIGHTING, &c .- The Lighting Committee has accepted the terms of the electricity department for

electric lighting of street lampe—34s. per annum plus 3s. 6d. for each 1,000 hours during which the lamps are lighted.

The Electricity and Tramways Committee has resolved that in respect of installation work executed by the Corporation on private consumers' premises, a charge of 10 per cent. above actual cost price be made for establishment charges, supervision, management, wages, &c., and, where specifications, quantities, &c., only are prepared, and the works not carried out by the Corporation, a

charge of 5 per cent. on the estimated cost be made.

A scheme for lighting the fire station by electricity has been

Bath.--The E.L. Committee recommends that Messrs. Mirrless, Bickerton & Day, Ltd., be asked to inspect the Diesel engine at the works and to submit their suggestion for altering, completing and reassembling the same, together with an estimate of the costs.

Blackrock (Co. Dublin). -- L.G.B. Inquiry.-P. C. Cowan, of the Irish L.G.B., will hold an inquiry on 26th inst, into the U.D.C.'s application for sanction of a loan of £13,000 for an electric lighting scheme.

Bridlington.—The T.C. has decided to seek the approval of the L.G.B. for the use of a site adjoining the electricity works for the erection of a dust destructor.

Boston.—E.L. SCHEME.—The T.C. has asked the B. of T. to receive the deputation to discuss the option of purchase to be given to the Council, and the maximum price to be charged for current, under a prov. order being applied for by Mr. Robert Arthur Smith. The Council has received the sanction of the L.G.B. to a loan of £3,600 for the erection of a refuse destructor.

Cheltenham.—Street Lighting, &c.—The Electric Lighting Committee has reduced the charges for street lighting by £500, and transferred £352 from the profits to the relief of the

Chingford.—Prov. Order.—The U.D.C. has decided to withhold its consent to the prov. order for electric supply being applied for by the County of London Electricity Supply Co.

Clacton.—New Battery.—The Council has decided to install a new battery at the electricity works, at a cost of £1,684. The Electricity Committee's report on the past year's working showed steady progress, the gross profits being £360 more than in the previous 12 months, whilst £114 was carried forward, as against £24 in the previous 12 months.

Continental. — Holland. — A concession has been granted to the Province of Overijssel for the construction and exploitation of works for the supply of electricity.—Board of Trade Journal.

Dartford.—The Electric Lighting Committee has resolved to petition against the London Electric Supply Bill.

Denton.—Public Lighting.—The U.D.C. has decided to have the bandstand in, and entrances to, the park lighted by electricity, the cost to be included in the estimates for the ensuing year.

Doncaster.—Sale of Fittings, &c.—At the statutory meeting of ratepayers to consider the provisions of the Corporation's Parliamentary Bill, a resolution was moved, on behalf of the Tradesmen's Association, for the deletion of clauses empowering the Corporation to sell meters and fittings connected therewith, and to sell, let for hire, and fix, &c., electric fittings and appliances. On behalf of the Corporation, it was contended that the numericality were in the clauses endeavouring to protect the municipality were, in the clauses, endeavouring to protect the interests of individual traders as against trusts and big companies. The deletion of the clauses was agreed to by a large majority.

Edinburgh.—Effect of War.—An interesting statement as to the effect of the war on the electric light undertaking has been made by Councillor Stevenson, who said their revenue was heavily hit, due to the restricted public lighting on the one hand and the modified private lighting, but during the seven months since May last they had connected 97,507 8-C.P. lamps, while during the whole of the year 1913-14 they had only connected 148,027 lamps, so that in spite of the war the figures showed that the business had been growing more rapidly than in the previous year.

Essex.—The County Council has decided to oppose in both Houses of Parliament the Bills of the London and District Electric Supply Co., the Woodford and District E.L. Co., and the two London Electricity Supply Bills.

Farnham (Surrey). - A Committee of the Council having made inquiry of the Gas Co. as to an extension of cables to the Hale Ward, has been informed that the demand for current would not be sufficient to justify the expenditure. It has therefore been decided that inquiries be instituted by the Council with a view to securing a supply of electricity otherwise than through the Farnham Gas and Electricity Co., upon terms which will impose no undue burden upon the existing rates. One Councillor remarked that they might just as well remain in the dark as have the gas at present being supplied.

Gillingham (Kent).—School Lighting, &c.—Owing to consumers not being allowed to use outside lamps, the T.C. has decided to reduce the charges for hire during the period of non-use to 1s. each per quarter, and to make no charge for the hire of the meter during that period. At the request of the secretary to the Education Committee, a report is to be prepared on the installation of the E.L. at five non-provided schools in the borough, on the basis of the Education Committee paying for current at a rate covering the cost of the installations and the hire of fittings.

Glastonbury (Somerset). — Prov. Order.—At a meeting of the T.C. the town clerk reported the deposit of plans and notices with regard to the proposed E.L. order for which Messrs. Christy are applying, and it was decided to ask that the compulsory area should be enlarged. Greenock.—Loan Sanction. — The Corporation has been notified that the Secretary for Scotland has given his sanction to the application to borrow \$30,000 for the electricity undertaking.

Hayward's Heath.—PROV. ORDER.—The U.D.C. has decided to request the B. of T. to grant an extension of time for carrying out the prov. order for E.L. granted to the Mid-Sussex E L. and P. Co., Ltd.

Hazel Grove and Bramhall.—Proposed E.L. Scheme.

—The U.D.C. has decided to engage Mr. T. L. Miller to report upon a scheme of electricity supply for the Council's district, at a fee of 25 guiness, plus out-of-pocket travelling expenses.

Henley-on-Thames.—PROV. ORDER.—The T.C. has empowered the town clerk to take the advice of the Parliamentary agents before any further steps are taken respecting the prov. order for E.L. being applied for by the Reading Electric Supply Co.

Hereford.—The T.C. has applied to the B. of T. for consent to the supply of current along a route in the city, by overhead lines at a pressure of 440 and 220 volts.

overhead lines at a pressure of 440 and 220 volts.

The R.D.C. has consented to the T.O. supplying electricity to Tupsley Court, which is outside the borough, subject to cables passing along or across any highway being placed underground.

Holme.—The U.D.C. has considered the Bill of the Yorkshire E'ectric Power Co., and has decided to ask for an assurance that the Bill will not prevent the Council or a local company from running an electric plant in Holme.

Holmfirth.—E.L. Scheme.—B. of T. sanction has been received to the scheme of the Council for supplying electricity.

HOVe.—PLANT EXTENSIONS.—It is proposed to install a 500-kw. mixed pressure turbine set, a new battery, booster sets and switchgear at the Leighton Road Works. Superheaters would also be fitted to the boilers, and the engineer estimates an improvement of the efficiency of the present plants of some 20 per cent. The estimated cost of the work is £6,970. It is suggested that energy be supplied to local wiring contractors, for showroom purposes, at 3d. per unit.

Keighley.—Half-watt Lighting.—It has been decided to erect two additional 2,000-c.p. half-watt lamps in East Parade, the annual cost for current and maintenance being estimated at £10.

Kingstown.—On Thursday, last week, in London, Mr. S. L. Brown, K.C., as Arbitrator, opened the proceedings in connection with the amount to be paid as compensation by the Kingstown U.D.C. to the Dublin Southern District Electric Supply Co. under a prov. order obtained in Parliament last Session for the transfer of the undertaking to it within six months on its paying the expenses incurred by the promoters.

Lees.—PROPOSED E.L.—With reference to the promotion of a Bill by the Stalybridge Joint Board seeking powers to extend its supply of electricity to Lees, and other districts, the Oldham T.C. has appointed a special sub-Committee to confer with the Lees D.C. on the matter.

Limerick.—Proposed Loan.—The Corporation has made an application to the L.G.B. for sanction to a loan of £5,000 for additional plant and machinery at the electricity works, and the inquiry will be held on the 22nd.

Liverpool. — ELECTRICAL PUMPING. — It has been decided to replace the drainage pump at the Canada Graving Dock pumping station by a larger one, electrically driven, at a cost of £550.

London. — GREATER LONDON SUPPLY SCHEME. — In view of the opposition, most prominent on the part of Borough Councils who are electric suppliers, to its scheme, the L.C.C. has appealed to such Councils for their views on the advisability of obtaining uniformity and establishing a bulk supply, and asking on what terms the Councils would support the Bill. The Hammersmith B.C. has intimated, in reply, that it cannot support the Bill.

HACKNEY.—The B.C. is recommended to present petitions against the Lindon and District Electricity Supply Bill and the London Electric Supply No. 2 Bill.

BATTEBSEA.—The B.C. has been advised that the Port Authority

BATTEBSEA.—The B.C. has been advised that the Port Authority has fixed the rental of the suction and discharge pipes in the Thames in connection with the water-condensing plant at the generating station, at £75 per annum for a period of five years.

Lytham.—The Bulk Supply Proposals.—The St. Annes and Lytham's Councils have not been able to come to terms in connection with the bulk supply of electricity. The St. Annes Council has now declined to admit the right of the Lytham Council to supply electrical energy to the Tramways Co. in Lytham after June, 1917, and has intimated that as it sees no hope of arriving at a mutual understanding, it is not disposed to discuss the matter further, and was willing, if Lytham assented, to drop the agreement altogether. The Lytham Council has now written to St. Aunes stating that the papers have been sent to their Parliamentary agents for them to arrange for a reference to counsel of the differences between the two Councils.

Maidenhead.—The T.C. has agreed to supply current to the motor works of G.W.K. Ltd., who, it is anticipated, will pay at least £300 a year for energy.

Nelson.—The T.C. has approved a proposal to give a supply of current to Barrowford, and the electrical engineer is to prepare estimates, &).

Newcastle West (Co. Limerick).—E.L. Scheme.—It was reported to the T.C. that the ratepayers had decided by a large majority in favour of the lighting of the town by electricity, and the clerk was directed to communicate with Mr. Wm. Phelan in reference to a scheme submitted by him.

Oldham.—HEATING TABIFF.—The T.C. has reduced the price of electric energy in the town for cooking and heating purposes to a flat rate of 1d. per unit.

Randalstown (Co. Antrim).—CAMP LIGHTING.—The military camp lately constructed here is to be lighted by electricity supplied locally, the adjacent river providing the power for the local lighting and the camp.

Ripon.—Camp Lighting Scheme.—In connection with the arrangements which are being made for the reception of a large number of soldiers at the military camp, it is intended to install an electric lighting plant and to erect a power station near the Pateley Road. The Corporation is to have the opportunity of a supply in bulk and to undertake the distribution, with possible eventual purchase of the power station.

Salford.—L.G.B. INQUIRY.—An inquiry was held on January 8th into the application of the Corporation to borrow £22,910 for new plant and equipment, and for an extension of the Frederick Road electricity works. There was no opposition, and the inquiry closed.

Sevenoaks.—The R.D.C. has decided to formally oppose the London Electricity Bill in order to permit of action being taken.

Skelton and Brotton (Yorks.). - Supply Inaugu-BATED.—The supply of electrical energy by the Council under its lighting order of 1913 was officially commenced on January 1st, and on the same day the ordinary lighting consumers of the Cleve-land and Durham Electric Power Co. in Carlin How were taken over by the Council's undertaking. The area of supply contains a population of about 16,000 inhabitants, and embraces half-a-dozen land and Durham Electric Power Co. in Carlin How were taken over by the Council's undertaking. The area of supply contains a population of about 16,000 inhabitants, and embraces half-a-dozen distinct parishes somewhat widely separated from one snother. On economic grounds, therefore, overhead lines have been adopted almost exclusively, only a small length of underground mains having been used for a few special "crossings." A bulk supply is taken from the Cleveland and Durham Power Co. at high pressure at several sub-stations and there transformed by the Council. The general supply is given on the four-wire three-phase system with a frequency of 40 periods and at a pressure of 250 volts for public and private lighting, and 440 volts for power purposes. A small section of the lighting supply in the parish of Carlin How hitherto given by the Power Co. at 110 volts is being maintained at that pressure. Solid copper wires are used throughout, the sectional area of the main line being '05 eq. in. for each of the three-phase wires and '025 eq. in. each for the two neutral wires. The public lighting and small branch lines are mainly No. 11½ s.w.G. with a split neutral of the same section. The greatest span on the line is about 180 ft., and the average 140 ft., the height of the wires above ground being 22 ft. The lines are protected by lightning arresters fixed at the various sub-stations. Both steel and wood poles have been used, the latter being restricted to the more rural roads in the district. Each pole is fitted with a double safety oradle formed of No. 3 copper wire connected to the neutral wires, and insulated from the supports. Special "oradling" has been provided where the lines cross railways and telephone and telegraph wires. The length of route provided with distributing lines is about 16 miles. The substations are equipped with Berry transformers, B.T.H. high-pressure switchgear and Westinghouse low-pressure switchgear, All the public street lamps, numbering close upon 400, are being electrified with "Maz for additional units. A minimum quarterly charge for metered supply is 5s. Slot meter supplies are available for premises of a rateable value not exceeding £20, with installations not exceeding rateable value not exceeding £20, with installations not exceeding 500 watts at 5½d. per unit, while contract supplies are given under special conditions to premises of a rateable value of not exceeding £20, at an inclusive charge of 7d. per week for an approved installation of not more than five lamps, with an additional charge of 1d. or 2d. per week for each additional 20 or 40-watt lamp respectively. Already over 250 private consumers are being supplied, many of them on the contract principle for a fixed inclusive weekly payment according to the number of lamps installed, a method of supply which the Cleveland miners appear to appreciate. appreciate.

(Continued on page 83.)

RECENT DEVELOPMENTS AT THE SALFORD ELECTRICITY WORKS.

THE Frederick Road generating station of the Salford Corporation electricity department will live in the memory of those who were familiar with it as it appeared a few years ago, if only for its imposing vistas of medium-speed reciprocating sets and Lancashire boilers.

These works which were established in 1902, and described in our pages at the time, had a total plant capacity of 6,400 kw. of direct-current generators, supplemented by batteries of 270 kw. capacity on a three-hour discharge; the station was erected at the time when the electrification of the Corporation tramway system was being carried out, and it superseded the little single-phase alternating-current plant which represented the Cor-

poration's first venture in electric supply works.

Since that time the demand for electrical energy in the area, which is a purely industrial one, has advanced at a great rate, and the 14 million units output of 1902 has

first installation of three-phase plant at the existing station to meet immediate requirements, although we understand that no final course has been definitely adopted. Thus, on the advice of Mr. J. A. Robertson, the borough electrical engineer, it was decided in June last to place the order for a 5,000-kw. three-phase turbo-alternator, to make room for which one of the original 800 kw. direct-current sets was removed. The new turbine plant, which we illustrate in fig. 1, was supplied by the British Westinghouse Co., and officially started up on December 2nd last.

Co., and officially started up on December 2nd last.

It consists of a Westinghouse-Rateau impulse turbine running at 1,500 R.P.M., driving a 6,600-volt, 50-cycle alternator of the compensated type and an exciter on the end of the main shaft, together with surface-condensing plant below, the necessary space to accommodate the latter having been obtained by mounting the new turbine some 12 ft. above the original engine-room floor level.

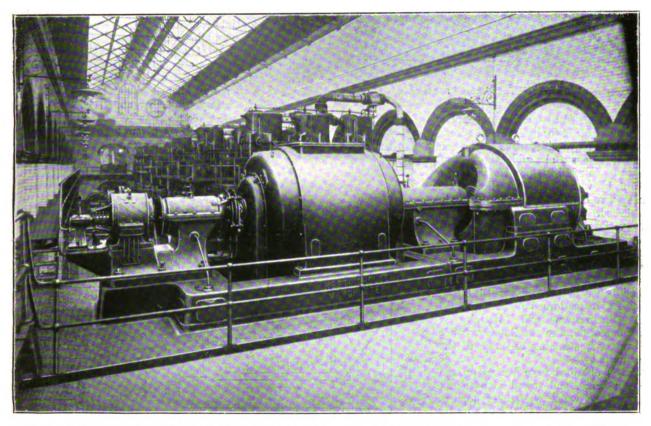

Fig. 1.—Interior of the Frederick Road Generating Station of the Salford Corporation, showing 5,000 kw, Tubbine Set in Foreground.

expanded to 20 millions, of which about 8 million units represent the tramway demand. There are, at the present time, some 16,700 H.P. of motors (exclusive of tramway motors) connected to the mains, including over 5,300 H.P. of hired motors.

In the interval three 1,000-kw. direct-current turbine sets and a battery with a three-hours' discharge capacity of 675 kw. have been added to the original equipment, and more recently—in 1913—owing to the insufficiency of plant to meet the winter demand and the necessity of doing something, an agreement was entered into with the Lancashire Electric Power Co. for a bulk supply up to 3,000 kw. for a period of three years.

It was realised, however, that the whole question of future supply would require to be dealt with on a comprehensive scale if the growing demand for cheap electricity for power purposes was to be successfully met, and that this would necessitate the introduction of large turbine plant and H.T. three-phase generators and distribution to sub-stations in the borough, and the Electricity Committee, faced with the alternatives of re-equipping the Frederick Read station on modern lines, or erecting an entirely new one, has made a

The condenser is designed for a normal valuum of $27\frac{1}{2}$ in. on full load, and is provided with two sets of air and extraction pumps, each driven by a 35 H.P. steam turbine running at 2,500 R.P.M., and each capable of doing the whole load. The circulating pump is driven by a 50 H.P. motor running at 475/545 R.P.M.

A view of the condenser auxiliaries taken from engine room floor level is shown in fig. 5.

The three-phase switchgear in connection with the new turbine and rotary converter plant, the latter installed for the bulk and local supply, has been supplied by the British Westinghouse Co., and consists of oil-switches in brickwork cubicles, situated in a switch chamber at one side of the engine room, and operated by electrical remote control from a control board in the main switch room at one end of the engine room.

The transforming plant installed at Frederick Road works consists of three 1,000-kw. G.E.C. and two 750-kw. Westinghouse rotary converters and transformers, while in connection with the outside supply a sub-station is almost completed at the Salford Docks, which will contain three 1,000 kw. rotary converters, and allow for three similar

machines being installed later. This will supply power and lighting to the No. 9 Dock, where a large grain elevator is nearing completion. A static sub-station has been equipped at Pump Street in the Ordsall district to supply local works,

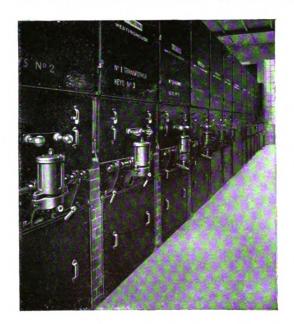

FIG. 2.-E.H.T. SWITCH CUBICLES.

and it is proposed to build another rotary sub-station in the Greengate district for lighting and tramway supply. It has, moreover, been decided to add a second 5,000-kw. three-

phase turbine set alongside the present one, to be in readiness for the winter of 1915-6, by which time the three-phase H.T. system of supply will be definitely established.

As various improvements and alterations have been made at the Frederick Road station from time to time, some reference to its general equipment may be of interest.

The boiler house contains 16 30 ft. × 9 ft. Lancashire boilers, equipped with superheaters and Hodgkinson machine stokers, also one Babcock boiler of twice the steaming capacity of the other units.

Coal is obtained from barges on the adjacent canal, and stored in overhead bunkers from which the stoker hoppers are fed through spouts in the usual way.

The coaling equipment includes an electrical jib crane for transferring the coal from barge to the hopper of a Babcock tray conveyor, which rises from the canal bank passing along the top of the bunker structure.

At either end of the boiler house are economisers and a brick chimney, also a pump room with electrical and steam-driven feed pumps, to which a turbine-driven pump is being added. The original engine plant is of the jet condensing type, the water for which was obtained from the canal at one time. The increasing water requirements of the station, however, led to the adoption of cooling tower plant and the sinking of a deep well for the supply of make-up water for all purposes.

At present four Balcke towers are in use, and an adjoining pump house contains four 60-H.P. Mather & Platt motor-driven centrifugal pumps for forcing the water over the towers.

All the four turbine sets have been fitted with surface condensing plant, the condensate from which is used for boiler feed purposes, supplemented when required from the jet condenser hot well, the water of which is treated to remove any oil.

In the engine room, in addition to the 5,000-kw. turbine set mentioned, there are three 1,000-kw. Willans turbines coupled to one Brown-Boveri and two Siemens direct-current generators.

Six of the original 800-KW. Browett, Lindley-Mather and Platt direct-current sets remain, but one has been converted to the "Unaflow" type.

As our readers are aware, an unfortunate fire caused great damage to the switchgear at Frederick Road a year or two back; this has led to a complete reconstruction of this part of the plant, which now includes only modern boards, installed in the switch-room at one end of the building.

The upper floor of the switch-room contains a Ferranti single-phase switchboard and a Bertram Thomas direct-current traction board, while on the ground floor are installed a Bertram Thomas direct-current lighting and power board, battery switchgear and a Westinghouse control board for the three phase switchgear.

A single-phase supply is given to certain outlying districts and in the Prestwich area, being taken from the

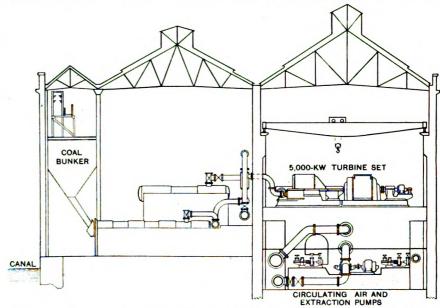

Fig. 3.—Sectional Elevation, showing Abrangement of 5,000-kw. Turbine Set, with Condensing Plant, &c.

three-phase plant through two "Scott" connected Ferrant transformers, giving a two-phase (twin single-phase) 50-cycle supply at 3,000 volts.

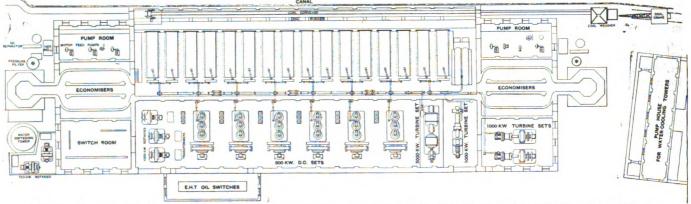

Fig. 4.—Plan of the Frederick Road Generating Station showing Relative Space Requirements of the Modern Three-Phase and Older Direct-Current Turbine and Reciprocating Plant.

Digitized by Google

Euch transformer consists of two units, and a spare unit is provided.

Tae switchboard is built up of standard Ferranti non-

interlocked H.T. single-phase ironclad panels, including six transformer, two booster and eight feeder panels, some of them being spare. The automatic boosters and their switches were supplied by Messrs. Switchgear & Cowans, Ltd.

The Bertram Thomas traction board carries six 3,000-ampere generator and 20 feeder circuits equipped with reverse and overload circuit breakers respectively,

of the loose handle type.

The feeder panels are entirely positive, a negative bus-bar for the feeders and generators being placed in the basement. The upper portions of the generator panels are positive, and separate lower portions carry the equaliser switches.

Bire copper strip connections from the top of the board pass down the wall to join lead-covered feeders at floor level.

The direct-current lighting and power board by the same firm on the floor below was designed with a view to accommodating a large number of feeders in a limited length. This provides for 12 3,000-ampere generator circuits and 68 (34 positive and 34 negative) 1,000-

ampere feeder circuits, the former being at 12-in. and the latter at 9 in. centres.

The positive and negative sections of the board are separately groupe1; the bus-bars are mounted on the front of the panels, and the switches make direct-contact on them.

The circuit breakers, of the reverse current type on each generator pole and of the overload type on each feeder, are all mounted on the back of the board and operated from the front.

The connections leaving the board are all in bare copper, and at top or bottom only, and in the case of both direct-current boards non-inflammable insulation has been pro-

Elliott Bros. We reproduce in figs. 7 and 8 views of the upper and lower switch-rooms, showing the single-phase and direct-current boards installed there.

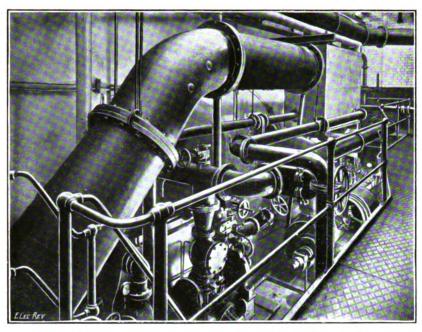

FIG. 5.—VIEW OF THE ROTARY AIR AND CIRCULATING PUMPS, 5,000-KW. WESTINGHOUSE TURBINE.

In conclusion, we are indebted to Mr. J. A. Robertson, the borough electrical engineer, and to his deputy, Mr. Dickson, for giving us every assistance in the compilation of this description.

REINFORCED CONCRETE.

WE are given to understand that the Local Government Board is setting its face against reinforced concrete to a very great extent, and refuses to sanction loans for this material for such periods as it would for other materials of construc-

tion, such short terms as ten years being what the Board will only allow in cases where, ordinarily, 25 years would be the period. Many a concrete building is ugly and unsightly and has the appearance of something which has failed to find a suitable body shape in which to live. Arched bridges are structures for which concrete appears to be a very suitable material, and in which it acts under the best conditions; it is under such conditions that any material shows to the greatest advantage, and such structures, carrying in their form the elements of stability, must inevitably present an artistic appearance, like the windmill tower, whose form and figure are fitted to the work to be done, and which is, therefore,

Windmill tower, whose form and figure are fitted to the work to be done, and which is, therefore, necessarily artistic.

It is fortunate that the dictum of the Local Government Board on matters of engineering does not carry very much weight, though it may have serious effects because of the

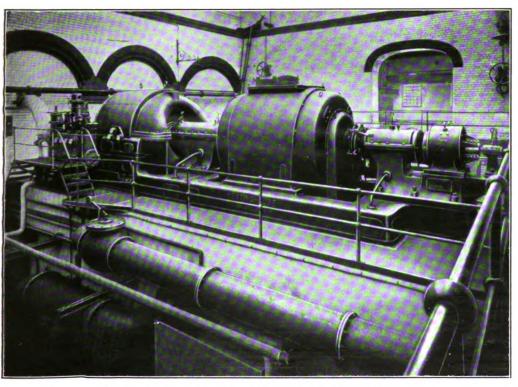

FIG. 6.-5,000-KW. WESTINGHOUSE THREE-PHASE TURBINE SET.

vided for all small wiring and for the iron frameworks of the panels, in order to minimise the risk of accidental contact and fire. All the instruments were supplied by Messrs.

results which arise out of the Board's bad judgment; but a protest ought to be made against the Board's ruling. Properly constructed, reinforced concrete is a safe and sound

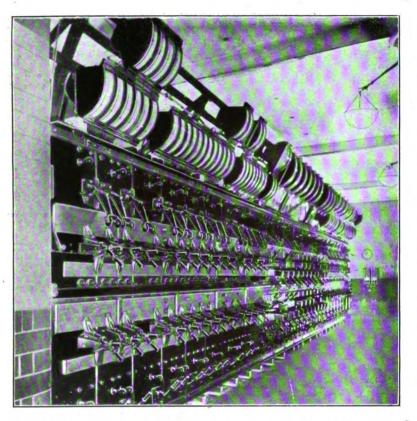

FIG. 7.—BERTRAM THOMAS D.C. LIGHTING AND POWER BOARD, SALFORD ELECTRICITY WORKS (see page 81).

material, and the metal rods which it encases are very effectively protected from all external influences. All the weight of evidence is, we believe, in favour of the safety of the material, and probably the Concrete Institute will see to it that the evil influences of the Local Government Board are curbed.

But a word of warning may be given as to the unnecessary use of the new material. There is

a tendency for it to be employed where bricks and mortar would be cheaper. Quite recently a case came under notice where two quite independent tenders were sent in for reinforced work. They differed considerably in amount for the same work, but the same firms quoted alternative prices for brickwork; the two offers were remarkably close and were a long way below the lowest offer for the reinforced concrete. Like so many new things which at the outset are supposed to be extraordinarily simple and cheap, ferro-concrete is by no means simple and is not always cheap. Where a structure can be so designed then concrete may be brought in usefully, but, though there is no great time required to tip the stuff into its moulds, a very great amount of time may be occupied in preparing the moulds and placing the many bars and hooks in position. The secret of good reinforced construction is to arrange the metal cores so that they occupy the direction of the lines of stress and failure which would develop in a homogeneous solid of like form under like stress application. Probably the true field for reinforced

concrete work is in large and heavy work and in repetition work rather than in small work, for which the moulds involve a cost out of proportion to the small weight they contain.

There is a good deal of what may be termed the

charlatanism of the tradesman in some reinforced concrete practice. Special bars are urged as the only really safe bars; the bars must be twisted, so as better to grip the con-

crete, but if twisted to the right instead of to the left, they will not hold the cement at all, and so on. Needless to say, most of these pretensions are mere twaddle. Any man who is an expert in steel girder work stresses should know how to dispose his tension material in concrete. The fact that metal bars are to be embedded in the concrete should not serve as an excuse for the slightest carelessness in the mixture. It is more than ever important that the aggregate should be good and clean; that the sand should be the same and in quantity more than enough to fill the voids, and that the cement should be well burned and slow setting, and in quantity more than ample to fill the sand voids. Cement ought not to be given its slow setting quality by the admixture of gypsum—that German method of adulteration for which there is no excuse, tending, as it does, to unsound cement.

The aggregate should be reasonably moist to begin with, enough cement to colour it all cement colour being put in before adding the sand and cement, which should be thoroughly mixed by machine before adding the aggregate and water. The time-honoured mixing by turning twice dry and thrice wet, or even doubling this amount of turning, is not to be considered as mixing, for it does not eliminate the brown streaks of the sand. Important work should be machine-mixed dry, and then the mixing continued wet.

Once Bit, Twice Shy.—At the meeting of the Illinois Electric Railways Association at Chicago, November 21st, Mr. W. F. Carr. Ottawa, Ill., advised against the policy of discharging men who had made mistakes which caused accidents, for, he declared, a serious accident for which a man is to blame leaves an

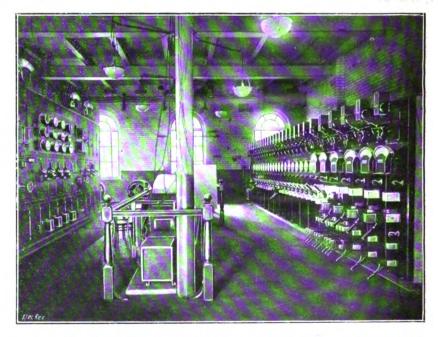

FIG. 8.—THE UPIER SWITCHROOM, SALFORD, SHOWING SINGLE-PHASE AND D.C. TRACTION BOARDS (see page 81).

incelible impression upon his mind and makes him a more careful and thoughtful operative in the future. If, on the other hand, this same man were to be discharged, his place must be given to a new man, and it is very possible that the whole lesson of safety and carefulness will then have to be learned all over again.—

Electrical World.

LIGHTING and POWER NOTES.

(Continued from page 78.)

Sheffield .-- AN OPPOSED INQUIRY .-- The electrical contractors in the town are instructing counsel to represent them at the L.G.B. inquiry to-morrow (Saturday), in opposing the applica-tion of the City Council for a loan for the erection of the electricity department's new premises in Bow Street, it being contended that the existing accommodation is sufficient if the department limits its operations to what the traders consider legitimate business.

- The Victoria Falls and Transvaal South Africa. -Power Co. reports that the amount of power now being delivered shows an increase over that for June last. In connection with the erection of new plant at Brakpan, the first extension set will be in commission within a month, and the second set will be available for service two months later. Fresh demands for power requirements are being received.

Stockport.—L.G.B. INQUIRY.—An inquiry has been held respecting an application of the T.C. for permission to borrow £17,000 for the electricity undertaking—£12,500 for turbogenerating plant, and £4,500 for two water-tube boilers. The inquiry was closed.

Torpoint.—STREET LIGHTING.—The U.D.C. has definitely decided to substitute electricity for gas for public lighting, and has accepted the tender of the Electricity Supply Co. for a term of three years at £3 2s. per lamp per annum. The alternative was 3d. per unit. The Gas Co. tendered at £1 19s. 6d. per 100 c.p. lamp, or 3a. 9d. per 1,000 cb. ft., and it was stated that with mantles, &1., the cost per lamp would work out at £2 16s. 2d.

Torquay.—Proposed Loan.—The T.C. is to make application to the L.G.B. for sanction to a loan of £13,808 for new plant and machinery at the electricity works.

Wells.—HALF-WATT LIGHTING.-Tunbridge Lighting Committee proposes to substitute two 800 c.P. half-watt lamps for each of the nine arc lamps in three street

Walsall .- The Council recently adopted the bold policy Walsall.—The Council recently adopted the bold policy of replacing the old generating station and plant by a modern station on a new site; the erection of this is now progressing, and together with the proposed alterations of system of distribution is expected to result in a great reduction in costs. Under the advice of the recently-appointed manager (Mr. H. A. Howie), the scale of charges for lighting, heating and cooking has been revised and alternative tariffs provided, including a rateable value scheme of charging for domestic supply. A sales department has also been instituted, and a showroom opened in the centre of the town. of the town.

Warrington .- Extended Supply Area .- The R D.C. has decided to grant the necessary declaration of support to the T.C.'s application for powers to supply electricity to the districts of Great Sankey and Penketh. The Stockton Heath Parish Council or treat namesy and remain. The broadent result raises couldn't has also decided to assent to the proposed order in so far as relates to the district, provided that the energy shall be supplied on not less favourable terms than those on which it is supplied to consumers in Warrington.

Whitefield.—Sewage Plant.—Application is to be made to the L.G.B. for sanction to the installation of an electric plant at the sewage works instead of the gas plant previously approved of, and to the borrowing of a further loan of £128 to cover the increased cost.

Windsor.—Electric Pumping.—An electric motor pump is to be installed at the waterworks for use while the turbines are out of action. This will last until the river drops to its normal height.

Wokingham.—The R.D.C. has decided not to oppose the application of the Reading Electric Supply Co. for a prov. order to supply current to parishes within the Council's area.

Wolverhampton .- SEWAGE WORKS SUPPLY .- The Electricity Committee has decided to give a supply of current to the sewage works for power and lighting purposes.

Worcester.—Sewage Pumping.—The City Council has WOFCESTEF.—SEWAGE FUMPING.—The Ulty Council has had the question of sewage pumping under discussion, after considering reports by the city electrical engineer and city engineer bearing on the relative costs of electricity and suction gas. In the opinion of the Committee, the annual cost of pumping by suction gas and electricity was £2,000 and by all-electric drive £2,330, and it was decided to recommend the Council to adopt the latter, but to retain the suction gas plant for pumping storm water. As the result of long discussion, however an amendment water. As the result of long discussion, however, an amendment was adopted obtain the suction gas and electric plants at the works and obtain careful costs of their working, when a further report will be presented.

The T.O. is to apply to the L.G.B. for a loan of \$800 for electric services during the next three years.

-L.G.B. INQUIRY. — The Corporation, applied to the L.G.B. for sanction to borrow £19,000 odd for the purposes of the electricity undertaking, the usual inquiry has been held. During the hearing, the inspector (Mr. Hooper) criticised the fluancial policy of the undertaking when he was informed that the reserve fund practically only amounted to £55.

TRAMWAY and RAILWAY NOTES.

- PARCELS SERVICE. — The tramway Accrington. department, in conjunction with Messrs. Lober's motor-'bus service, is now carrying parcels between Accrington and Burnley.

Bournemouth.—The B. of T. has sanctioned the borrowing by the Corporation of £3,903 for the reconstruction of a portion of the tramway track in Holdenhurst Road.

Bradford.—The Tramways Committee has considered

a report by the general manager in regard to a mishap to a car on Church Bank; the Committee highly commended the conductor, awarding him £5 for meritorious conduct.

SIX MONTHS' WORKING.—The report of the working of the city tramways for the six months ended September 30th, 1914, shows that the income was £161,818, an increase of £8,559; the profits increased from £20,797 to £23,780; and the mileage run indicated an advance of 141,000 miles. On the other side of the account the maintenance of cars showed an increase of £8,300: wages of drivers and conductors £2.815 more than the of the account the maintenance of cars showed an increase of £3,300; wages of drivers and conductors £2,815 more than the corresponding six months of 1913; and there was also an increase of £1,695 for electric power. There was a saving of £3,400 on repairs to the permanent way, and a decrease of £985 in the amount of the rates on the undertaking. As a whole, the tramways had suffered a loss of £337 during the half-year, but there is compensation in the fact that the whole expenditure—including interest and sinking find charges—has only hear £d mer mile one penny and sinking fund charges—has only been 8d. per mile, one penny less than the corresponding period of 1913.

Cardiff.—The Tramways Committee recommends the doubling of the tramway track from the corner of City Road to Milton Street, at a cost of £7,000.

Continental Notes.—ITALY.—The electrification of the Italian State Railways is progressing steadily, if slowly. It is controlled mainly by the available funds in the hands of the Railway Administrator in each financial year. The progress of the works is shown by the yearly expenditure since 1907. In the the three years from 1907 to 1910 the expenditure was 3,084,000 lire; In the working year 1910-11, 3,786,000 lire; 1911-12, 4,800,000 lire; and in 1912-13, about 7,000,000 lire. There was also allotted in 1912-13 for electric traction permanent plants about 13,000,000 lire, besides a sum of about one million lire for other works. This contrasts with 4,225,000 lire allotted in 1911-12. On June 30th, 1913, the extent of the transmission lines amounted to nearly 800 km. The sub-stations numbered 30, four of which belonged to the old Varesine section. The total power amounted to 50,000 km. Electric traction has worked regularly on the Turin-Modane line, on the old lines of the Giovi, on the Milan-Varese section, and on the Valtellina lines, and a regular electric service of passenger and goods trains has been started on the Savona-S. Giuseppe-Ceva section. There now remains the electrification of the branches of the Giovi, the Lecco-Monza and the Turin-Pinerolo lines.—Revista tecnica & Elettricita.

A public meating was recently held at Cantallo, near Milan with Continental Notes .- ITALY .- The electrification of the

electrincation of the branches of the Giovi, the Lecco-Monza and the Turin-Pinerolo lines.—Revista tecnica d'Elettricita.

A public meeting was recently held at Cantello, near Milan, with the object of forming a society for the construction of an electric tramway to run from Varese to Folia di Malnate, Cantello and Ligurno, and eventually to the Swiss frontier. The scheme has arisen out of a desire to provide employment for men out of work.

work.

The Italian State Railways power station at Rivarolo was recently completely destroyed by fire, the cause being unknown.

FRANCE.—A Reuter's Paris message mentioned a tramway collision last week on the Vincennes-St. Augustine route, by which one person was killed and 40 injured—13 seriously and three one pers mortally.

Edinburgh. — TRAMWAY PURCHASE. — The Tramway Committee has agreed to seek expert advice before finally deciding to ratify the agreement between the Committee and the Tramway Co. relating to the acquisition by the Corporation of the company's rolling stock at the time of the expiry of the lease.

Halifax. - TRAMWAY EXTENSION BILL. - The promotion in Parliament of a Bill for tramway purposes and works, involving an expenditure of £120,000, has been agreed to at a special meeting of the T.C.

Hollingworth.—A Sub-Committee has been deputed to confer with the Mottram and Saddleworth D.C.'s on the question of the Stalybridge Joint Board's Tramways and Electricity Bill.

Hull.—TRAMWAY EXTENSION.—The T.C. has decided to apply for a prov. order for the construction of additional tramways

London.—Tube Extensions.—The Hammersmith B.C. is to discuss the District Railway Bill to be promoted in the next session of Parliament. This seeks power to construct an additional single line, to relieve west-bound traffi, under the Broadway, and to make other arrangements to permit of the Piccadilly Tube trains using the existing District Railway tunnel.

Malthy.—The P.C. has unanimously agreed to support the Rotherham Corporation's proposal to substitute tramways for the present railless trolley vehicle system between Rotherham and

Morley.—Proposed Loan.—The Leeds T.C. has applied for a loan of £31,500 for the erection of a tramway depôt, substation, &c., at Morley.

Nottingham.—New Route Opened.—The extension of the Corporation electric tramways from Sherwood to the neighbouring urban district of Arnold was opened on January 1st. A 10-minute service is provided on the new route.

Newcastle-upon-Tyne.—Owing to the number of complaints as to the inefficiency of the local tramway service, the chairman of the Corporation Committee made a statement, pointing out that 295 men had joined the Army, of whom 230 were either motormen or conductors, men whose places it was difficult to fill. Some 150 other men had been absorbed in local works, mainly in the armament and warship building works in the neighbourhood. Some of this loss they had been unable to replace, and now they had only 653 on the books as against 723 at the outbreak of war. Another factor which tended to handicap them was an increase in the traffic. The system had had to cope with nearly an increase in the traffic. The system had had to cope with nearly 200,000 more persons than over the Christmas of a year ago, the mileage was increased by 6,000 miles, and there were only two more cars running than a year ago. A similar state of things was found in the New Year week. Much of the delay in sections of the service is attributed to the movements of troops in the city and neighbourhood.

Sheffield.—The Tramways Committee has adopted a report of a Sub-Committee recommending the conversion of 12 single-deck cars into double-deckers.

St. Helens.—An application has been received from the Lancashire Light Railways Co. for terms upon which the Corporation will supply energy to the light railway between Prescot and Knotty Ash.

Wallasey.—It is proposed to double the tramway track in Seabank Road and Seaview Road.

Yeadon,—GAS LEAKAGE.—At the last meeting of the Council a complaint was made by the Leeds electrical engineer in regard to an escape of gas in Kirk Lane. It appeared that gas got into the tramway boxes, which contained fully 50 per cent. of gas, and this not only constituted a danger, but also hindered the completion of the tramway extensions. The attention of the Gas Co. had been drawn to the matter on two or three occasions, but nothing had been done. The Council decided that the Gas Co. should be asked to attend to the matter.

TELEGRAPH and TELEPHONE NOTES.

Australia.—A reduction has been made by the Federal Executive in the charge for wireless messages to and from vessels licensed in Australia and New Zealand, from 11d, to 6d, a word,-

A wireless station has been erected at Rabaul, and is working satisfactorily, communications being transmitted through Port Moresby and Thursday Island to Australia. The installation, which comprises Telefunken and Marconi instruments, was mostly the property of the German Government, being used at a high-power station at Bitapaka, which was captured after a sharp encounter. The whole of the installation and the operating has been done hy members of the Expeditionary Force, and is under the charge of the senior operator, Corporal G. H. Smythe, Signaller, assisted by four Marconi operators. Power is supplied by a captured German dynamo and converter driven by a Bolinger oil engine, under Electrician Corporal Tenbosch, assisted by two mechanics.—Sydney Morning Herald.

Canada.—On January 1st an amalgamation of the Great

North-Western and Canadian Northern Telegraph Companies took place, and the two systems will in future te operated as one under the style of the Great North-Western Telegraph Co.

It is understood that within the next few months the lines and offices of the Western Union Telegraph Co. in the Maritime Provinces will be operated by the Great North-Western Co., which will then have the largest telegraph system in Canada, covering the country from the Atlantic to the Pacific.

It had been stated in Canada that the Grand Trank Pacific

It had been stated in Canada that the Grand Trunk Pacific Railway's telegraph system was also to be included in the merger, but this is denied by the Grand Trunk Pacific Co., which announces that its system is entirely distinct from the new combination, and is fully equipped for carrying on commercial telegraph business from the head of the lakes to the Pacific Coast.—Standard.

China.—Tsingtao, which was recently captured from Germany by the Japanese, was connected with Yap Island in the South Seas by a submarine cable rid Shanghai, the station being located in the German Post Office in Shanghai, which is a neutral city; the shore ends of the cable at Shanghai are also in neutral territory. The line was taken over by the Japanese on the fall of the fortress, and it is announced that it will have to be cut on the high seas in order that it may be connected with the Japanese Post Office in Shanghai. Fire Alarms at Luton.—The Fire Brigade Sub-Committee has reported in favour of the installation of the "Knight" fire-alarm system in the town, at a cost of £450. The matter is under consideration.

Field Telegraphs in East Africa.—The unexpected difficulties which may be met with in novel circumstances are well illustrated by the following extract from a letter published in the Times:—"The funny side of war is very much before us out here. The telegraph section, for instance, with great speed and efficiency fixed up the field telegraph, 48 miles of it, on bamboo poles. Next day, walking along the line, I never saw such a mess. Wherever a giraffe had come across it in the night he seemed to have wound it round his neck and then started off at top speed."

Illicit Wireless Apparatus.—Henry Summers, smack owner, charged at Ramsgate with having in his possession, without the permission of the Postmaster-General, certain apparatus intended to be used for sending or receiving wireless messages, which he said he bought from the Trinity Brethren in 1913 for 9 guineas, and had tried to sell, was fined £10, including costs. On January 11th a district court-martial was held at Manchester on Frederick Goddard, of Ardwick, charged with having at his home certain wireless apparatus. Evidence was given to the effect that his wireless installation was dismantled at the beginning of the war. He had a licence to use a wireless tele-

beginning of the war. He had a licence to use a wireless tele-graph for experimental purposes. The proceedings were adjourned to Tuesday, when the accused was acquitted.

-An agreement has been made between the Russia. Russian and Mongolian Governments which grants the Russian Central Administration of Posts and Telegraphs a concession for the construction of a telegraph line from Monda, in the Government of Irkutsk, to the Mongolian town of Uliasutai.—Board of Trade Journal.

San Marino.—This little Republic on the Adriatic is accused by Germany of allowing its wireless station to be used for transmitting news from French warships to Paris. The Government of San Marino has refused to allow a German Commission to visit the plant, but would consent to an Italian Commission.

The Telephone Service.—No fewer than 450 telephone exchanges have been opened in small villages during the last three years. The average number of subscribers on these rural exchanges is 10. In addition, 1,200 call offices have been opened at places too small to support an exchange.—Standard.

Wireless in Warfare.—The Wireless World for January states that in 1913, during the Upper Rhine reliability trials, the old Zeppelin "Viktoria Luise," which took part in the trials, remained throughout their duration in constant wireless communiold Zeppelin "Viktoria Luise," which took part in the trials, remained throughout their duration in constant wireless communication with the base at Frankfort over distances up to 120 miles, and with other stations up to 200 miles, so that a regular wireless service for her passengers was maintained. The wireless equipment of the newer naval and military craft is far more powerful. The aerial consists of a 3-mm. phosphor-bronze wire, unwound to the required length (the full length being 750 ft.) from a spool, and floating freely in the air when the airship is aloft. The apparatus itself is extremely compact, and derives the necessary power from a small dynamo driven off the engines. It weights, complete, 150 lb., or, including the dynamo, 270 lb.; has a minimum range of 120 miles, and can encompass wave-lengths varying between 300 and 1,200 metres. It is claimed that the danger from sparks during the process of transmission has been wholly eliminated. Every large aerodrome in Germany, both military and civilian, has its wireless station, some of which, such as those at Johannisthal, Cologne, Friedrichshafen, Frankfort, and Mannheim, are very powerful. In addition, the construction was begun some time ago of a series of wireless stations forming a ring right round the German frontiers. Their purpose is twofold; first to enable German airships to remain in constant wireless touch with a German base during their expeditions; and, secondly, to provide them with what may be described as a wireless compass, enabling them to fix their position when out of sight of land with only to a fair degree of accuracy as a result of signals from these enabling them to fix their position when out of sight of land with quite a fair degree of accuracy as a result of signals from these wireless stations,

CONTRACTS OPEN and CLOSED.

OPEN.

Australia. — ADELAIDE. — February 10th. Testing struments. for Postmaster-General. See "Official Notices Testing instruments, for Postmaster-General.

January 1st.

BRISBANE.—March 10th. Motor-generator, power board, &c., for Postmaster-General. See "Official Notices" to-day.

BRISBANE.—(Extension of time to March 16th.) Common battery multiple switchboard and automatic or semi-automatic switchboard, &c., for the Deputy P.M.G.—Board of Trade Journal.

PERTH.—February 10th. Telephone switchboards and parts, for Postmaster-General. See "Official Notices" January 8th.

Melbourne, Brunswick and Coburg Tramways Trust.—February 24th. Special work, bonds, steel and wood poles, overhead materials, H.T. cable, trucks, and sub-station electrical equipment, March 10th. Car equipments (motors, &c.), car bodies, wheel

guards. Specifications for each item, £2 2s. (returnable), from the office of the Engineer (Mr. Struan Robertson), Sydney Road, Coburg. Copies can be seen at the Board of Trade Commercial Intelligence Department in London.

Beckenham,—January 25th. U.D.C. One 120-kw. D.C. generator and switchgear to couple to 120-kw, steam alternator. See "Official Notices" January 8th.

Bolton. — February 11th. Corporation. Low-tension sub-station switchgear, for the Electricity Department. See "Official Notices" January 8th.

Bury.—January 30th. Extension to reinforced concrete retaining wall at the electricity generating station, Chamber Hall, Specifications, &c., from Mr. J. A. Settle, Borough Engineer.

- January 30th. Corporation. Cheltenham. months' supply of electric light fittings, &c. Forms of tender from Mr. J. S. Pickering, Borough Engineer.

Croydon. — January 25th. General stores, for the Corporation Tramways Department, for a year. The Manager, Thornton Heath.

Darlington.—February 2nd. Corporation. Alternative tenders for 2,000-kw. and 3,000-kw. turbo-alternators; separate tenders for condensing plant. See "Official Notices" to-day.

Ipswich.—January 22nd. Corporation Electric Supply Department. Coal-handling plant. Specification, &c., 21s. (returnable). Mr. F. Ayton, Engineer and Manager.

Larne.—January 29th. For lighting public streets and roads by electricity for three years from August 1st, by the U.D.C. Particulars from Mr. W. G. Younge, Clerk to the Council.

Leeds.—January 22nd. Overhead electrically-driven travelling crane, and coal and ash-conveying plant, for Electric Lighting Department. See "Official Notices" December 11th.

Platelaying, &c., London.—L.C.C.—January 26th. Platelaying, &c., for electric tramway, Grove Road and Burdett Road, &c. Specifications, &c., from Mr. G. W. Humphreys, County Hall, Spring Gardens, S.W.

January 25th. Lighting installation (200 wiring points, 260 lighting points) at Exmouth Street Elementary School, Hampstead Road, N.W. See "Official Notices" to-day.

BATTERSEA.—The B.C. is recommended to invite tenders for three, six, nine and twelve months' supply of oils, engine-room stores, electricity meters, service joint-boxes, electric lamps, &c.

Manchester.—January 19th. Tramways Committee.
(a) Permanent way special track work, and (b) permanent way points, tongues, and hardened steel centres. Specifications, &c. (£1 1s. returnable), from Mr. J. M. McElroy, general manager. Tramways Committee.

New Zealand.—Wellington.—February 28th. Public Works Department. 18 step-down transformers, for the Lake Coleridge power scheme. Specification at the Public Offices, Wellington.

Oldham. — January 18th. For electric lighting the Council School at Higginshaw, for the Oldham Education Committee. Specifications from Messrs. Winder & Taylor, architects, Union Street.

Plymouth. — January 21st. Corporation. months' supply of carbons, A.C. meters, transformers, cables, oils, waste, &c. See "Official Notices" January 8th.

Redditch.—U.D.C. Two turbo-alternators, each 1,000 KW., with condensers, cooling tower, &c.; two synchronous motoralternators of 300 kW. and 150 kW. respectively. See "Official Notices" January 8th.

Rochdale. — January 27th. Tramways Committee. Erection and completion of repair shops: (a) reinforced concrete foundations and car platform, (b) steelwork (steel frame), and (c) builders' work. Particulars from Mr. P. W. Hathaway, Town

Spain.—February 7th. The municipal authorities of Berlange de Duero (province of Soria) are inviting tenders for the concession for the electric lighting of the town during a period of

10 years.

Tenders have just been invited by the municipal authorities of Sarria (province of Lugo) for the concession for the electric

lighting of the town during a period of 10 years.

Tunbridge Wells.—January 26th. Cooling tower and pipework, two water-tube boilers, economisers, mechanical stokers, pipework, and feed heater, for Borough Electricity Works. See "Official Notices" January 1st.

Woodstock.—February 4th. Generating plant, switch-board, battery, wiring, lamps and fittings (120 points), for the Union Workhouse Guardians. See "Official Notices" to-day.

CLOSED.

Australia.—In connection with the parcels post office Australia.—In connection with the parcels post office building adjoining the Sydney railway station, the Minister for Home Affairs has accepted the following tenders:—Four goods lifts, electrically driven, Messrs. Edmiston & O'Neill, \$6,700; two service lifts, electrically driven, Messrs. Edmiston & O'Neill, \$600. He has also accepted the tender of Messrs. Gibson, Battle & Co. for an electrically-driven inclined elevator, including foundations. The whole of the work is to be of Australian manufacture, with the exception of some small items, such as ropes, which are not made in Australia; they will be of British manufacture.—

Melbourne Age.

Melbourne.—An Australian newspaper states that large orders for wire have just been placed by the Postmaster-General's Department, the department having accepted the offer of the British Insulated and Helsby Cables, Ltd., to supply 126 tons of wire, of varying weights, for £10,625. All the wire is to be of English manufacture manufacture.

The following contracts have been placed :-

P.M.G.'s Department, Victoria.

80 cable terminals, 52 pairs, £466 13s. 4d.—Mr. F. B. Cook.

P.M.G.'s Department, Tasmania.

5.M.G.'s Department, Tasmania.—

300 telephones, common battery wall pattern, £176 5s.—British General Electric Co., Ltd.

100 telephones, common battery table pattern, £125 8s. 4d.; 75 ditto, with generator, £196 15s.; 50 ditto, table pattern, with generator, £107 10s.; 100 ditto, with switch, £418 15s.; 25 ditto, table pattern, with switch, £97 10s.—J. Bartram & Bon Pty.

3 tons bronze wire, £361: 10,000 copper tapes, £9 3s. 4d.; 10,000 binders, £12 18s. 4d.—British Insulated & Helsby Cables, Ltd.

Sydney Municipal Council has received the following tenders for-2.000-K.V.A. 88.000/5.000-VOLT TRANSFORMERS.

Warburton, Franki, Ltd. ... Lawrence, Hanson Electric Co., Ltd. Melbourne City Council.-

Hoists, electric, motors, at city abattoirs, £1,552.—Edmiston & O'Neill.

Bacup.—The T.C. has decided to order two transformers from Messrs. Ferranti, Ltd., and 7/18 8 w.G. cable from the Macintosh Cable Co., Ltd. The tender of the Post Office has been accepted for connecting the out-stations and the central police station by telephones.

Bradford.—The Tramways Committee has accepted the tender of Messrs. Wm. Hird, Sons & Co., Ltd., of Wyke, Bradford, for the supply of 4,000 yards of grey serge, at the price of 6s. per yard, for the purposes of uniform clothing, for the Tramways Department. It has also resolved to accept the offer of the Bradford Technical College to supply five pieces of similar cloth at the same price.

The Technical Education Sub-Committee of the Corporation has accepted the following tenders for motors and wiring to motors in the workshop :--

Phornix Dynamo Manufacturing Co., Ltd.—Five motors, £360. Smish & Croft.—Wiring the above motors, £68.

Bristol.—The Docks Committee of the T.C. has accepted the tender of Messrs. Siemens Bros. for arc lamp carbons.

Canterbury. - The T.C. has accepted the tender of Mr. S. Terry for electrical engineers' work for the ensuing half-vear.

Clacton.—The tender of Messrs. Johnson & Phillips, Ltd., has been accepted by the U.D.C., at £425, for supplying and laying various lengths of cable.

Dartford.—The E.L. Committee has placed orders with Messrs. John Hudson & Co., Ltd., and Messrs. E. J. and W. Gold-amith, Ltd., to supply 300 tons of bituminous coal, at 2s. per ton above contract price to cover war risks, and for 110 tons of Derbyshire peas, at 18s. 6d. per ton, and 600 tons of New Hucknall slack, at 16s. 9d. per ton, respectively.

Gillingham (Kent).—The T.C. has accepted the offer of Messrs. Wm. Cory & Son, Ltd., for up to 150 tons of coal for the electricity works, at 2s. per ton over contract price.

London.—The Metropolitan Asylums Board has accepted the tender of Messrs. Turnham & Co., at \$257, for installing electric light, internal telephone and bell system, provision of electric bells, and separating the fire alarm system at Sheffield House, Sheffield

BATTERSEA.—The Electricity Committee has accepted the tender of the Empire Stone Co., at £545, for the construction of a reinforced concrete coal-bunker at the generating station. The Committee recommends that the offer of Mesers. Foster & Co. for 6,000 tons of Pooley Hall small coal be accepted.

HAMMERSMITH.—The B.C. Electricity Committee has accepted the offer of Messrs. W. Cory & Son, Ltd., for 1,000 tons of Midlands small coal, at 8s. 6d. per ton; and that of Messrs. Cory Bros. & Co., Ltd., for 1,000 tons of Gedling small coal, at 12s. 6d. per ton.

Morley.—The Leeds Corporation Tramway Committee has accepted the tender of Mr. Paul Rhodes, of Leeds, for the erection of a tramway depôt at Morley.

Nuneaton.—The T.C. has accepted the tender of Messrs. Brown-Boveri & Co., at £65, for the supply of an automatic pressure regulator for the Electricity Works.

Salford. — The Tramways Committee recommends the acceptance of the tender of Messra. Edward Wood & Co., Ltd., for the steel work required for the extension of the central car depôt, Pendleton, at £1,295.

Sheffield. — The Electricity Supply Committee has resolved to accept the following tenders:-

Staveley Coal & Iron Co., Ltd.—Cast-iron feed water pipes, £65.
Foster Bros.—Mild-steel steam pipes and valve, £133.
Lea Recorder Co., Ltd.—Combined recording water meter, including steel notch tank and float chamber £108
T. Smith & Sons.—Steam crane and grab, £1,018.

The City Council is recommended to accept the tender of the General Electric Co. for the supply of two 30-H.P. electric motors to the Water Department.

Ship Lighting.—The tender of Messrs. Siemens Bros. Dynamo Works, Ltd., has been accepted for the supply of Wotan, tantalum, and carbon filament lamps to Mesars. G. Thompson and Co., the Aberdeen White Star Line.

Stockport.—The Health Committee has accepted the tender of Messrs. W. A. Shaw & Co. for certain alterations to the electric lighting at the hospital.

The tender of Messrs. Kelsall Bros., for Pleasley best nutty slack top hard, Mansfield. at 10a. 5 i. per ton delivered, from 70 to 90 tons per week for 12 months, has been accepted by the Electricity Committee. The Committee has also offered to take a limited weekly supply of Brownless slack, Biddulph Valley, at 9s. 3d. per ton delivered, for a period of 12 months.

The T.C. has accepted the tender of Messrs. Dick, Kerr & Co., Ltd., for a 5,000-kw. turbo-alternator.

Stretford.—The Electricity Committee has accepted the tender of Messrs. W. T. Henley's Telegraph Works Co. for 150 yards of 8-in. single cable, for £84.

Torquay.—The Electricity Committee has agreed to a request from Messre. Whiteway & Ball that they should be paid an extra 2s. per ton on the original price for any future supplies of coal, owing to the difficulties and delays in navigation.

Weymouth.—The Electricity Committee has accepted the tender of Mesers. Browett, Lindley & Co., Ltd., for a 200-kw. gas-driven plant, at £3,000, and that of Mesers. Whipp & Bourne for the necessary switchboard, at £87. The tender of Mr. G. F. Bowering, at £398, for foundations for machinery at the electricity works has been accepted.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, January 15th. At 8 p.m. At 89, Victoria Street, Paper on "Motor-Car Accessories," by Mr. R. S.

59. Viotoria Street. Paper on "Motor-Car Accessories," by Mr. R. B. Fox.

Friday, January 23nd. At 8 p.m. At 89, Viotoria Street. Paper on "Rotary Air Pumps," by Mr. A. Arnold.

North-Western Section.—Monday, January 18th. At 7.45 p.m. At Jafa Caté. 26, Corporation Street, Manchester. Paper on "Country House Electric Lighting Installation," by Mr. C. F. Clifton.

Institution of Electrical Engineers (Newcastle Local Section).—Monday, January 18th. At 730 p.m. At the Mining Institute. Paper on "Automatic Protective Switchgear for Alternating-Current Systems," by Mr. E. B. Wedmore.

Powal Society of Arts.—Monday, January 18th. At 8 p.m. At John Street,

Royal Society of Arts.—Monday, January 18th. At 8 p.m. At John Street, Adelphi, W.C. Cantor Lecture on "Olisi their Production and Manufacture," by Dr. F. Mollwo Perkin.

Illuminating Engineering Society.—Tuesday, January 19th. At 8 p.m. At Boyal Society of Arts. John Street. Adelphi. Discussion on "Some Points in connection with the Scientific Development and Practical Application of Searchlights."

Nottingham Society of Engineers.—Wednesday, January 20th. At 7.30 p m. At Welbeck Hotel, Milson Street. Ten-minute papers by members.

At Welbeck Hotel, Milton Street. Ten-minute papers by members.

Institute of Marine Engineers.—Wednesday, January 20th. At 7.30 p.m.

At Tower Hill, Minordes, E.O., Extraordinary General meeting.

At 8 p.m. Inaugural address by Sir A. Denny, Bart., LL.D.

Greenock Electrical Society.—Thursday, January 21st. At 7.45 p m. At 21, West Stewart Street.

Paper on "Electricity in a Shipbuilding Yard," by Mr. D. Angus.

Institution of Mechanical Engineers—Friday, January 22nd. At 8 p.m.
At Storey's Gate, S.W. Paper on "Standardisation of Pipe Flanges and
Flanged Fittings," by Mr. J. Dewrance.

Physical Society of London.—Friday, January 22nd. At 5 p.m. At Imperial
College of Science, South Kensington. Paper on "Practical Harmonic
Analysis," by Dr. A. Russell.

Analysis," by Dr. A. Russell.

Royal Institution of Great Britain.—Saturday, January 28rd. At 8 p.m. At Albemarle Street, W. Lecture on "Aerial Navigation—Scientific Principles," by Dr. R. T. Glazebrook, F.R.S.

Association of Mining Electrical Engineers (West of Scotland Branch).—

Saturday, January 28rd. At 4.30 p.m. At Royal Technical College, Glazgow. Joint Meeting with National Association of Colliery Managers. Paper on "Electricity at the Coal Face," by Mr. J. Bowman. After the meeting several Visual Signal Indicators will be exhibited.

NOTES.

Parliamentary.—South Shields Corporation Bill. —A town's meeting of South Shields ratepayers has defeated the Corporation Bill, under which tramways estimated to cost £16,711 were proposed.

were proposed.

DONCASTER CORPORATION BILL.—The ratepayers of Doncaster at a town's meeting have defeated the clauses in the Corporation Bill for the sale and hire of electrical fittings. A poll was subsequently demanded, but it was stated that if the Corporation persisted in including the clauses, the Bill would be opposed in Parliament by the Chamber of Commerce.

STANDING ORDERS.—The County Council of the West Riding of Yorkshire has presented memorials against the Botherham Corporation Bill and the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board Bill, alleging no 1-compliance with standing orders. In each case the allegation is that the promoters have not obtained the consent of the Council, who are the road authority for the construction of certain tramways. the road authority for the construction of certain tramways.

Preferential Terms.—In a letter to the Municipal Journal Mr. H. Faraday Proctor, hon. secretary of the I.M.E.A., deals with the question of power rate and photo printing, as follows:—In the issue of the Municipal Journal of December 25th, follows:—In the issue of the Municipal Journal of December 25th, 1914 (Ref. 101), is published an inquiry from the chairman of an Electricity Committee, asking whether it is illegal to supply current at power rate for photo printing. The town clerk of the undertaking in question and the Municipal Journal express the opinion that such a practice is illegal, as it is lighting, and not power. I should like, most emphatically, to protest against such a provided that the such a process of the such as the such

ruling.

It must be remembered that electrical undertakers do not sell either light, heat or power. Their commodity is electrical energy, and when such energy is used for photo printing it is not used as an illuminant, but for its actinic properties—a purely commercial use; and may certainly, therefore, be sold as power.

If the argument held good that electricity used for photo printing must be considered lighting and sold as such, then all luminous radiators would come under a similar ruling.

The ultimate purpose for which energy is used must be taken.

radiators would come under a similar ruling.

The ultimate purpose for which energy is used must be taken into consideration in determining whether such use is lighting, power or heating, and a moment's consideration will make this clear. In all electric lighting the energy is used primarily to heat the carbons or filaments in the lamps to such a temperature that they produce light, but would any one suggest that all such energy must be sold at the heating rate? The natural corollary would be the abolition of all lighting rates.

Appointments Vacant.—Two shift engineers (£2); fitter for County Asylum, Whalley, near Blackburn; power station superintendent (£175) for Maidenhead Electricity Works; engineer-in-charge (£2 15s.) for Sunderland Electricity Works; engineer-in-charge (£2 15s.) for Sunderland Electricity Department; junior engineers (25s.) for Cleveland and Durham Electric Power, Ltd., Middlesbrough; electrician-in-charge for the Callan Electric Lighting Society, Ltd., Callan; electrician (35s.), for Croydon Mental Hospital; meter tester (35s.), for Salford electricity works; assistant electrical engineer (£300), for Government of Nigeria. Particulars are given ino ur advertisement pager

Institution and Lecture Notes.—Institution of Electrical Engineers.—The following items appear on the programme of the BIRMINGHAM LOCAL SECTION for the second half of the session :-

January 29th.—"Lord Kelvin's Work on Gyrostatics," by Prof. A. Gray.
February 10th.—"Polyphase Commutator Machines," by Mr. N. Shuttleworth.

March 3rd.—"Electricity Applied to Mining," by Mr. C. P. Syarks.
March 17th.—"Electric Cooking, mainly from the Consumers' Point of
View," by Mr. W. R. Cooper.

April 14th.—"The Bombay Hydro-Electric Scheme," by Mr. A. Dickinson.

April 28th.—"The Power Supply to the Rand Mines," by Mr. J. H. Rider.
May 12th.—Annual meeting.

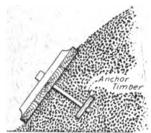

MANCHESTEE LOCAL SECTION.—At the meeting on Tuesday last a paper was read by Dr. S. P. Smith and Mr. R. S. H. Boulding, B.Sc., on "The Shape of the Pressure Wave in Electrical Machinery." The discussion was closed. The same paper was to

Be read in London last night.

Scottish Local Section.—At the meeting on Tuesday, Mr C. J. Beaver read his paper on "Cables." The meeting was held in Edinburgh, and there was a large muster of East of Scotland delegater.

Rugby Engineering Society.—On Tuesday last, a paper on "Modern Electric Lighting" was read by Mr. H. C. Wheat.

Anchor Boards for Cal Pile.—The accompanying aketch shows a method of preventing coal piles from spreading at the base, by enclosing the lower parts of the pile in courses of timbers anchored from within the pile itself. As the coal is filled in over the anchor timbers the weight of the coal serves to

ANCHOR CONSTRUCTION TO PREVENT COAL PILE FROM SPREADING.

keep the outer portions of the pile from spreading. This construction is especially convenient where it is desirable to keep clear a pathway which would otherwise be engulfed by the flow of the lumps of coal. Unless some such protection is used, the jarring and sweeping of passing teams and persons will ordinarily cause the coal to run down a grade very much less than its ordinary angle of repose.—Electrical World.

The Electrically-Propelled Super-Dreadnought "California."—Particulars now to hand show what important reinforcements and modifications have been made possible in the design of the United States first-class battleship California by the adoption of electric propulsion. Like her sister ships the Nevada and Oklahomah, the California is to rely exclusively on oil fuel, but the further saving in weight of bunkers, boilers, piping and condensers and in space occupied by these has made possible important additions to the armouring and armament of the vessel, besides improving conditions within her by less heating and less crowding of equipment. The California is to carry 12 14-in. guns (in four triple turrets) besides four submerged 21-in. torpedo tubes and a secondary armament of 22 5-in. guns. Her armouring is said to be the heaviest yet carried by any battleship. Besides a main belt 14-in. in thickness, special horizontal and vertical internal armouring is provided to guard against fatal injury The Electrically-Propelled Super-Dreadnought vertical internal armouring is provided to guard against fatal injury by submarine attack. The concentration of power equipment low down in the hull greatly increases the stability of the vessel (notwithstanding the reduced total weight of the equipment) and permits the secondary armament to be placed higher, the main armament to be increased materially and the armouring to be increased particularly by the use of 15 in conversion to the armament to be increased materially and the armouring to be increased, particularly by the use of 16-in. armour in the conning tower and communication tube and the provision of a truncated cone of 14 in. armour round the base of the funnel. The total boiler capacity being reduced about 50 per cent. by the use of electric propulsion, all the boilers can be placed beneath a single notate and by armouring the base of the latter the risk of

The total boiler capacity being reduced about of per cent. By the use of electric propulsion, all the boilers can be placed beneath a single uptake, and by armouring the base of the latter, the risk of damage in this vital spot is greatly reduced.

With a length of 625 ft., beam 97 ft. 3 in., and draught of 29 ft., the California displaces 32,000 tons. At 21 knots her power plant is designed to provide 32,000 shaft horse-power, probably by the use of four motors on two propeller shafts, though the final decision on this point has not yet been made public. The claims made in respect of the capital and working economies obtainable by electric marine propulsion have been justified completely by the performance of the U.S. collier Jupiter, the first large vessel to be propelled electrically, and one which has been tried by U.S. Navy experts against sister vessels fitted with triple-expansion engines and geared turbines respectively. The conditions of these tests and the subsequent voyage of the Jupiter from Mare Island Navy Yard to Hampton Roads leave no possibility of doubt concerning the superior efficiency and complete reliability of the electric system. The Jupiter being a vessel of 20,000 tons displacement, there is no reason to doubt that the advantages definitely established for electric propulsion in her case will be equally secured in the Cali-

formia. Supposing only four polyphase induction motors to be employed, each must be of 8,000 H.P., and motors already at work in rolling mills and other heavy industrial services show that there is no difficulty in building compact and reliable machines of such power to run at 200 H.P.M. or so, the terminal P.D. being, say, 2,500 volts. Due to the main turbo-generators continuing to run shead at full speed (and that the speed of maximum turbine efficiency) under all circumstances while the propeller shaft is driven electrically at the (and that the speed of maximum turbine efficiency) under all circumstances while the propeller shaft is driven electrically at the low speed giving maximum propulsive efficiency, from 25 to 30 per cent. fuel economy is secured, the weight of propelling maximum propulsive efficiency, from 25 to 30 per cent. fuel economy is secured, the weight of propelling machinery is halved, and a net capital saving of 40 to 50 per cent. is effected. Saving in weight and space can be applied to armament in war vessels and to cargo capacity in merchant vessels. In all cases full power is available for max œuvring or reversal without altering the conditions of operation of the turbo-generators; and at reduced, or "cruising" speeds, very considerable economy is effected by shutting down part of the generating plant and running the remainder still under conditions of maximum efficiency. In a rough seaway the tendency of one propeller to race while another

remainder still under conditions of maximum efficiency. In a rough seaway the tendency of one propeller to race while another slows down is compensated automatically, since the speed of an induction-motor is practically independent of load; the output of the turbo-generator remains constant, but its distribution between the propeller-motors varies automatically.

It is a matter for congratulation that electrical engineering has provided the means whereby there has been effected, in a single step, far greater improvement in the overall efficiency of mechanically-propelled vessels, than had previously been effected during the past quarter of a century. Equally important is it, to shipowners, naval authorities and electrical manufacturers alike, that the magnitude of the economies due to electric ship propulsion has been established incidentally by the Navy Department of a first-class Power, to which reliability and technical efficiency are primary considerations.

primary considerations.

The Coolidge X-Ray Tube.—We have received from The Coolidge A-Hay Tube.—We have received from the British Thomson-Houston Co., Ltd., of Mazda House, Upper Thames Street, E.C., a price list and particulars of the Coolidge X-ray tube, for which they own the British patents. The tube, which was described in our issue of October 16th last, represents an enormous advance over previously existing patterns—as great a step as from the hand-regulated are lamp of 50 years ago to the automatic flame are of to-day—for it does away with the variability and delicacy of handling of the old type, and raises the X-ray generator to the rank of an instrument of precision, which can be readily adjusted to any desired intensity, over a range far can be readily adjusted to any desired intensity, over a range far beyond that of its predecessors, and enables the quality of the rays to be exactly reproduced as often as desired; the tube can be used continuously without change in "hardness," the focal spot is fixed, the same tube can be used for all kinds of work, and it has a life of at least 1,000 hours. The rapidity of work is also greatly increased, a matter of immense importance to the surgeon, and as rays can be emitted resembling the gamma rays of radium, and the latter can be to a great extent replaced by the Coolidge tube. We understand that a large number of the new tubes are in use and giving excellent service in the military hospitals both at the front and in this country, a most fortunate circumstance for both surgeons and patients.

A Railway Levitated.—A writer on science in the Evening Standard includes in the list of scientific discoveries of 1914 the "levitated railway" of M. Bachelet. Apart from the 1914 the "levitated railway" of M. Bachelet. Apart from the fact that the railway was not at the time supposed to be "levitated," but only the cars, we may point out that its demonstration in New York in 1912 rather weakens its standing as "the second discovery that came during the year" 1914. We are told that "the idea of it was splendid, but, like all other ideas, it was entirely upset by the outbreak of war." But it was in May, months before the outbreak of war, that the idea was upset, and we did our share in exposing the fallacies upon which it was based; when the prospectus was issued in the first week of June, it fell flat. To credit the war with the failure of this fantastic scheme is ridiculous; but we believe that lapse of time has rendered the title much more appropriate now.

Relief Measures taken by Berlin Electrical Engineers.—The American Electrical Raview states that the Electrical Engineers Society of Berlin, Germany, has made the following appropriations: For the Berlin Red Cross Society, 1,000 marks; for the fund to assist Germans in foreign countries, 1,000 marks; for the fund to assist families of those fallen in battle, 1,000 marks; for families dependent upon enlisted men, 500 marks; for the Society for Children's Kitchens, 100 marks; for the National Service to Women, 200 marks. The Society is further subscribing 500 marks monthly to a fund to be loaned without interest to electrical engineers in temporary need. An employment bureau has been organised by the Society in conjunction with the Verband Deutscher Electroteckniker and the Verein Deutscher Ingenieure to enable engineers out of employment to find positions vacated by those who have entered the military and naval service.

West Sussex.—The Light Railway Commissioners have granted an order for the construction of a light railway from Hunston to West Itchenor, West Wittering and East Wittering, and for the reconstruction and working as a light railway of the Hundred of Manhood and Selsey Tramway.

Australian Action Settled.—Reuter dispatches from Melbourne state that the Vacuum Oil Co. issued a writ against the Melbourne Age, claiming £23,000 damages for an alleged libel contained in an article entitled "Trading with the Enemy," and that the paper has withdrawn its statements and apologised.

Foreign Trade.—The December Figures.—The following are the electrical and machinery figures given in the official returns for December:—

Month Inc. IMPORTS. Twelve Inc. Electrical goods and of months. apparatus, excluding December. dec. 1914. dec. machinery and un-insulated wire £ 2 £ £ 89,916 — 65,631 1,241,933 544,236 — 78,648 6,704,389 -345,361 Machinery 578,582

EXPORTS. Electrical goods and apparatus, excluding machinery and un-insulated wire

... 184,363 — 162,101 3,017,693 — 2,368,580 ...1,456,281 — 1,501,175 31,385,218 — 5,677,417

Auxiliary Steel Trolley Wire. - According to the AUXIMARY Size I Trolley wire. — According to the Electric Railway Journal, excessive wear on the No. 0000 copper trolley wire on the 6,600-volt single-phase lines of the Chicago, Lake Shore, and South Bend Railway made it necessary to install a No. 0000 steel auxiliary contact wire last year, which is suspended 1½ in. below the copper line on 2-in. duplex clips. About 103 miles of steel wire is in use exclusively on mast arm construction, although it is to be tried on span-wire suspension. The change transferred the wear to the galvanised iron sliding pantoatraction, although it is to be tried on span-wire suspension. The change transferred the wear to the galvanised iron sliding pantograph shoes, which gave only 2,500 miles per shoe between renewals. To overcome this trouble two pieces of half-oval mild steel, \(\frac{3}{2} \) in. \times 1\(\frac{1}{2} \) in. section, were substituted for the 12-gauge galvanised iron sliding pantograph shoes, raising the useful life of the shoe to 9,000 miles. The average cost of the new shoes is 15 cents for material and 30 cents for labour.

Fatality.—Harry Dalton (51), a tranguard in the employ of the Manchester Corporation tramways department, died on Saturday in the Stockport Infirmary from injuries received on the previous day through being crushed between the fenders of two tramcars. He was attending to his trolley at the time, and was trapped between the two cars, his thigh being fractured.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—At last week's meeting of the Swansea Electric Lighting and Tramways Committee, Mr. W. J. Burr, the new borough electrical engineer, reported that he had been very loyally received by the staff at the station. The Committee expressed appreciation of the services of the staff, and especially of Mr. Rees, who had acted as the borough electrical engineer for some months during a period of extreme difficulty.

Mr. W. N. Pritchard is no longer assistant engineer at Market Drayton electricity works, having taken up a similar position at the Newport (I of W.) electricity works.

Mr. A. C. North, switchboard attendant at Middleton electricity works, has resigned upon receiving another post, and Mr. W. Bower has been appointed in his place.

BOWER has been appointed in his place.

We regret to learn from Mr. A. J. BECKETT, of Bridlington that our last week's reference to him was not quite correct. He was offered a commission by the colonel commanding, and had accepted it, but his papers had not been passed. The latter part of the paragraph is accurate in the event of Mr. Beckett

receiving a commission.

MR. S. WHITEHOUSE, sub-station superintendent at the Walsall electricity works, has resigned his appointment. MR. J. D. SPARK,

MR. P. HUGHES has been appointed mains engineer at Walsall, and MR. P. HUGHES has been appointed meter inspector.

MR. PENFOLD, second chief engineer at the Dover Corporation electricity works, has enlisted in the London Engineers, and the T.C. has appointed MR. WILSON to fill his place.

T.C. has appointed MR. WILSON to fill his place.

MR. HITCHCOCK, shift engineer at the Tonbridge electricity works, having joined the East London Engineers, the U.D.C. has appointed as his successor MR. O. CANTLE, of the staff of the Kent E.P. Co., who was formerly at the Tonbridge works.

MR. JOSEPHS, shift engineer at the Gillingham (Kent) electricity works, having left to join the Army, MR. ALFRED E. HARDY, of Larbert, N.B., shift engineer with the Scottish Central E.P. Co., has been appointed to succeed him.

has been appointed to succeed him.

MR. T. ARNOLD TAYLOR has resigned the post of mains super intendent, which he has held since February last, with the Corporation of Sunderland, and has accepted the post of assistant engineer with the Burmah Electric Tramways and Lighting Co.

Tramway Officials.—The Reading T.C. has increased the salary of MR. J. MCLENNAN CALDER, chief assistant tramway engineer, to £220 a year, rising by two further annual increments of £15 to £250.

MB. JOSHUA BRIEBLEY, who has held the position of traffic superintendent on probation in the Oldham tramway department, has now been appointed permanently to the position.

General.—Messrs. Preece, Cardew & Snell inform us that they are taking into partnership Me. JOHN HALL RIDER (who will join them in April), on his retirement from the position of consulting electrical and mechanical engineer to the Central Mining and Investment Corporation, Ltd., and Rand Mines, Ltd., Johannesburg. Mr. Rider was, previously to his going to South Africa in 1910, electrical engineer to the London County Council tramways for nine years. The partners will be Mr. A. H. Preece, M.Inst.C.E., &c., Sir John Snell, M.Inst.C.E., M.I.E.E., &c., Mr. Llewellyn Preece, M.Inst.C.E., &c., Mr. J. H. Rider, M.Inst.C.E., &c., Mr. J. H. Woodward, A.M.I.C.E., &c., and Mr. S. Moore Ede, A.M.I.C.E. The designation of the firm after March will be Preece, Cardew, Snell & Rider, and the offices will be as heretofore at 8. Oneen Anne's Gate, Westminster. at 8, Queen Anne's Gate, Westminster.

The Manchester Courier states that the directors of the British

The Manchester Courier states that the directors of the British Engine, Boiler and Electrical Insurance Co., Ltd., have appointed Mr. Harry M. Longridge, B.A. (Cantab.) to be manager of the company. He has been in the service of the company for 10½ years. His grandfather, Mr. R. B. Longridge, who recently died at the advanced age of 93, was the pioneer of boiler inspection and insurance. Mr. H. M. Longridge is a son of Mr. R. Charles Longridge, the present managing director of the company, and a nephew of Mr. Michael Longridge, the chief engineer. Both of these gentleman will now partly relinquish active work.

Mr. James Banks, one of the superintendents of the telegraph department in the Edinburgh Post Office, has retired under the Civil Service regulations as to the age limit, after nearly 50 years' service. Mr. Banks received from the members of the staff serviceled by Mr. Banks received from the members of the staff succeeded by Mr. T. Warden, whose place is taken by Mr. J. N. Prescott.

Obituary.-Mr. J. Wright.-The death occurred on January 3rd of Mr. John Wright, sen., for many years a member of the firm of John Wright & Son, electrical engineers, Dover. Doceased, who was in his seventy-third year, was a Past Master of the Corinthian Lodge of Freemasons, and a prominent Conservative. The business will be carried on by his sons, Messrs. John and Edward Wright the latter of whom has managed the John and Edward Wright, the latter of whom has managed the electrical branch.

MR. MOSES STOKES, superintendent of Darwen tramways, died on Sunday night. Deceased went from Liverpool to the tramways

department at Darwen 30 years ago.

NEW COMPANIES REGISTERED.

D. & M. Synd (Hollister's Patents), Ltd. (138,898).—This company was registered on January 6th, with a capital of £2,500 ft £1 shares, to carry on the business of electricians, electrical and mechanical engineers, manufacturers and workers of and dealers in electricity, motive power and light, etc., and to enter into an agreement with F. L. Hollister. The subscribers are: F. L. Hollister, 8, Upper John Street, Golden Square, W., engineer, 25 shares; G. R. Taylor, 6, Sauth Square, Gray's Inn, W.C., managing clerk, one share. Private company. The number of directors is not to be less than three or more than five; the first are not named. Qualification, £25. Solicitor: A. W. Osmond, 6, South Square, Gray's Inn, W.C.

Osmond, 6, South Square, Gray's Inn, W.C.

Perfection Light Co., Ltd. (138,901).—This company was registered on January 6th, with a capital of £2,000 in 40 founders' and 1,000 pref. shares of £1 each, and 3,840 ordinary shares of 5s. each, to take over the business carried on at 5, Victoria Street, Westminster, and at 39a, Lower Kennington Lane, S.E., as the "Perfection Light Co.," to carry on the business of mechanical, gas, electrical and domestic engineers, manufacturers of and dealers in engines, machines, dynamos, lamps, wire, pipes, mantles, burners, insulating materials, accumulators, petrol and other oils, etc., and to enter into certain agreements, the parties to which are not named. The subscribers (with one share each) are: L. J. D. Gibson, Thicket Side, Maidenhead Thicket, Berks, civil engineer; F. Bradley, 60, Braxted Park, Streatham, S.W., civil engineer. Private company. The number of directors is not to be less than two or more than five; the first are L. J. D. Gibson and F. Bradley (joint managing directors). Registered office: 5, Victoria Street, S.W.

M44hurest and District Flectric Sunnly Co. J. Ltd. (138,886)

managing directors). Registered office: 5, Victoria Street, S.W.

Midhurst and District Electric Supply Co., Ltd. (138,886).

This company was registered on January 5th, with a capital of £7,500 in £1 shares, to carry on the business indicated by the title, and to adopt an agreement with B. E. G. Bailey, Hon. W. H. M. Pearson, and T. Stallibrass. The subscribers are: B. E. G. Bailey, The Old House, Midhurst, medical practitioner, 50 shares; A. Farley, Beachey House, Midhurst, merchant, 50 shares; J. Gwillim, North Road, Midhurst, 50 shares; W. H. M. Pearson, M.P., Capron House, Midhurst, 50 shares; T. Stallibrass, Rumbolds Hill, Midhurst, railway agent, 50 shares; Sir Stephen G. Sale, K.C.I.E., Heather Wood, Midhurst, 2,000 shares; R. P. Brousson, 47, Parliament Street, S.W., electrical engineer, 50 shares. Minimum cash subscription, 20 per cent. of the shares offered to the public. The number of directors is not to be less than three or more than seven; the first are B. E. G. Bailey, W. H. M. Pearson, M.P., and R. P. Brousson, Qualification, 50 shares. Remuneration as fixed by the company. Solicitor: G. C. Clarence, Market Place, Midhurst, Sussex.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Abingdon Electric Supply Co., Ltd.—Particulars of £3,000 debs., created December 31st, 1914, and secured by trust deed of even date, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital, and leasehold hereditaments at Abingdon. Trustees: J. H. Edwards, Haresfield, near Stonehouse, Glos., and A. A. Douglas, Brendon, Queen's Drive, Colwyn Bay, Denbigh.

Suffolk Electricity Supply Co., Ltd.—Issue on December 4th, 1914, of £750 debs., part of a series of which particulars have already een filed.

Royce, Ltd.—Capital, £170,000 in £1 shares (7,000 pref.).

—Return dated July 13th, 1914. 34,955 pref. and 72,487 ord. shares taken up;
£1 per share called up on 4,955 pref. and 6 ord. and 15s. per share on 30,000 pref. shares. £27,461 paid; £79,981 considered as paid, being £1 per share on 72,481 ord. and 5s. per share on 30,000 pref. shares. Mortgages and charges, nil.

Maxim Lamp Works, Ltd.—A memorandum of satisfaction in full on December 30th, 1914, of charge dated September 29th, 1910, securing £1,060 3s. 10d., has been filed.

Ely Valley Lighting Co., Ltd.—Capital, £5,000 in £1 shares. Return dated September 24th, 1914. 3.471 shares taken up; £3,468 5s. paid; leaving £2 15s. in arrears. Mortgages and charges, £890.

Wardle Engineering Co., Ltd.—Capital, £5,000 in £1 shares (2,000 pref.). Return dated July 29th, 1914. 2,885 ord. and 1,330 pref. shares taken up. £4,015 paid; £200 considered as paid. Mortgages and charges, nil.

Maud & Turner, Ltd.—Particulars of \$24,000 debs., created December 30th, 1914, and secured by trust deed dated January 1st, 1915, filed pursuant to Section 93 (3) of the Companies (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital and land with Perseverance Works, at Half Mile, Thorn, Halifax. Trustees: Harriet Maud and E. Broth

General Accessories Co., Ltd. (104,464).—Capital, £3,000 in 1,580 six per cent. pref., 820 five per cent. pref., and 500 ord. shares. Return dated August 28th, 1914 (filed Nov. 12th). All shares taken up. £1,580 paid; £1,420 considered as paid. Mortgages and charges, nil.

Electro-Mechanical Brake Co., Ltd. (98,276).—Capital, £20,000 in 2.500 six per cent. cum. pref. and 17,500 prd. shares of £1 each. Return dated October 9th, 1914. 987 pref. and 16,317 ord. shares taken up; £1 per share called up on 987 pref. and 10,282 ord.; £11,269 paid; £6,035 considered as paid on 6,035 ord. Mortgages and charges, nil.

Frinton-on-Sea and District Electric Light and Power Co., Ltd. (70,689).—Capital, £10,000 in 2,700 ord. and 73,000 pref. shares of £1 each. Return dated October 8th, 1914. 1,376 ord. and 5,125 pref. shares taken up; £6,501 paid. Mortgages and charges, £6,000.

CITY NOTES.

Tata Hydro-Electric Power Supply Co., Ltd.

THE Englishman states that Sir D. J. TATA presided at the annual meeting on December 3rd. He referred to the doubts and fears about the scheme in the form of bazar rumours, and fears about the scheme in the form of bazar rumours, and in order to remove them read a report by Mr. Joyner, the Company's Hydraulic expert. Mr. Joyner states that the dams are twice as strong as Kharakwashla dam, ten miles from Poona, which was built forty-six years ago and which is still absolutely sound and has never shown any tendency to be otherwise. The water supply too is expected to be better than was originally anticipated for whereas the estimate was that 62 per cent. of the rainfall would be collected during the past two monsoons, it has been found that the proportion running off the catchments is 80 per cent. in addition to which the cool surface of the lakes condensing damp air has caused heavier rain to fall on them. The ducts and forebay are described as "eminently suitable for their purpose in every respect" and the ducts will carry sufficient water to give 100,000 e.h.p.

100,000 e.h.p.
Sir Dorab, referring to the future of the company, roughly Sir Dorab, referring to the future of the company, roughly estimated that 160,000 H.P. would be required to meet the demand of Bombay, but as the full capacity of the present lakes could not possibly meet such demand it was resolved to find out a suitable site near Bombay, possessing advantages similar to those of the present scheme. Mr. Gibbs, general manager, has been successful in discovering other valleys in the Ghauts. With the sanction of Government survey parties have been at work. The whole problem is being considered by expert advisers.

Llandudno and Colwyn Bay Electric Railway, Ltd.

THE directors' report for the year to November 30th, 1914, The directors' report for the year to November 30th, 1914, states that the profit after providing for operating and administration expenses and interest on debenture stock, amounts to £5,144, plus £919 brought forward. There has been applied in providing for sinking fund instalment, due January, 1915, £1,475, and in writing off discount on debenture stock issued during year £50, leaving £4,538. The directors recommend a dividend at the rate of 4 per cent.

per annum (payable, less income tax, on January 30th, 1915), absorbing £3,976, carrying forward £562.

The traffic receipts show a decrease of £2,039, which is entirely due to the interruption of the holiday season consequent upon the outbreak of war, the receipts up to that period slightly exceeding those of the previous year. The receipts since the close of the financial year have been fully maintained.

The sinking fund in connection with the debenture stock has again been provided out of the revenue for the year, and the directors consider that this provision is sufficient to meet depreciation. The extension to Old Colwyn is now being carried out and will be completed in a few weeks. The doubling of the track from the end of Mostyn Avenue to St. John's Chapel in Linduduno was carried out during the year, and it is satisfactory to record that this work was carried out without seriously handicapping the working of the system.

Reduction of Capital.—TURNERS & MANVILLE, LTD. (AND REDUCED).—A petition for confirming the reduction of the capital from £50,000 to £39,994 has been presented and is now pending. List of creditors of the company is to be made out as for February 17th.

Companies Struck off the Register.—The following companies have been struck off the Register, and are accordingly dissolved :-

Automatic Glass Blowing Patents Syndicate.
Automatic Weldless Chain Co.
Auxiliary Power Co.
Bishop's Stortford and Stansted Electric Lighting Co.
British Electric Light Wiring Co.
British Electric Light Wiring Co.
British Ever-Ready" Electrical Co.
Burkel Tram Bail Syndicate.
Cauricedale Anti-Friction Metal Syndicate.
Concentric Condensers.
Cumberland Power Syndicate.
Economic Furnaces.
Metals Finance.
National Automatic Fire Alarm Co.
Penmachno, Corwen and Bestws-y-Coed Light Railway Co.
Positive Rotary Pumps.
Technical Advertising.
Traction and Power Agency.
Wolfram (Tungsten) Syndicate.

Sydney Electric Light and Power Supply Corporation.—According to an Australian paper just to hand, this company is reporting on the four months ending October 31st last, states that the new business continues satisfactory, and that during the period mentioned there has been an increase of 325 consumers. The profits for the four months amounted to £8,122, which, after paying a dividend at the rate of 7 per cent. for the period, and deducting £468 as portion of debenture flotation expenses, left a balance of £3,667 to be carried forward. Consumers have increased at the rate of nearly 40 per cent. per annum. After allowing for the interest payable on the first and second debentures, the balance of profit would be sufficient to pay roughly about 2 the balance of profit would be sufficient to pay roughly about 2 per cent. on the shares issued, but the directors have adopted a conservative policy, and are only paying the usual rate of 7 per cent. per annum.

Victoria Falls and Transvaal Power Co.—The Victoria Falls and Transvaal Power Co.—The Financial Times states that a circular has been issued to the shareholders of this company, stating that business since the last report has continued to make satisfactory progress, the war not having interfered with the undertaking in South Africa. The amount of power now being delivered shows an increase over that of June last. That is reflected in profits, which show a steady increase since the beginning of last year. In connection with the erection of new plant at Brakpan, the first extension set will be in commission within a month, and the second set will be available for service two months later. Fresh demands for power requirements are being received. ments are being received.

Electric and General Investment Co., Ltd.—The directors announce, says the Financial Times, that as they consider it advisable during the continuance of the war to conserve cash resources they do no propose to pay any interim dividend on the preference or ordinary shares.

Direct United States Cable Co., Ltd.—Interim dividend 2s. per share, less income-tax at 2s. 1d. in the £, (being at the rate of 4 per cent. per annum for the quarter ended December 31st, 1914), is payable on and after 31st inst.

Stock Exchange Notice. — The Committee has been asked to allow the following to be quoted in the Official List:-London and Suburban Traction Co., Ltd.—£350,000 5 per cent. "A" Debenture stock,

Kaministiquia Power Co., Ltd.—Dividend $1\frac{1}{2}$ per cent. on the common stock for the quarter ending January 31st.

Rio de Janeiro Tramway, Light and Power Co., Ltd.—A dividend of 11 per cent. is announced.

Sao Paulo Tramway, Light and Power Co., Ltd.-A dividend of 24 per cent. is snnounced.

Westinghouse Brake Co.. Ltd.—A dividend at the rate of 20 per cent. per annum for the half-year ended December 31st is announced.

STOCKS AND SHARES.

Stock Exchange fears, which assumed so bulky a shape when the Treasury requirements for reopening the House became known, have already begun to fade away now that the actual conditions of working show them to be less terrifying than they appeared in prospect. In spite of the fact that all speculation is stopped and that business is confined purely to investment orders, markets find a fair amount to do; while the advantage of being able to deal under shelter, and with dry feet, is certainly one that appeals in the wet weather that is not unknown in London these days.

What the papers call the release of the January dividends

What the papers call the release of the January dividends brought a certain amount of money to the stock markets. The most popular security of the moment is the War Loan, and, this apart, interest continues to centre mainly upon gilt-edged securities. It is a matter of no little astonishment to find how keen is the demand still for all kinds of electrical debenture stocks. Shares fluctuate: they have their weeks of favour and disfavour with the public, but for the higher-grade issues the

demand is constant and insistent. Buyers of course think that they ought to get stock a great deal cheaper than the prices at which it is offered, and disappointment still lingers that the war should have produced so few opportunities for bargain-hunting. Remains, however, the fact that most shares—and our list of electricity supply descriptions illustrates this—can be bought considerably cheaper than before the outbreak of war, when, it must be remembered, quotations had already suffered a severe shrinkage because of the abnormal financial conditions that prevailed for weeks before the storm actually burst uron Europe.

· 14.

of war, when, it must be remembered, quotations had already suffered a severe shrinkage because of the abnormal financial conditions that prevailed for weeks before the storm actually burst upon Europe.

The last few days have been noticeable mainly for further advances in Home Railway stocks. With dividend declarations so near at hand, and with all dealings for cash only, the bears have had an uncomfortable time, their anxiety not being lessened by the readiness with which small investors are buying odd lots of the best-known stocks. Why the electrical railway issues should have been overlooked it is difficult to say. They are likely to have their turn before long; and a recovery in Underground Electric income bonds and shares is an indication that this group is not without friends.

London and South Western 5 per cent. preference stock, issued to pay for partial electrification of the system, is well held at 103; but Metropolitan preference continues at a small discount. Work on the London and North Western electrification scheme seems to have been largely checked, no doubt in consequence of the war. There was great activity to get the new station at Chalk Farm finished before the autumn, but present operations are being carried out on a much smaller scale, the Company's men no doubt being required for handling the troop-traffic, and being denuded, of course, by the hundreds who have joined the colours.

The St. James' Electric Supply is usually the first of the electrical companies to declare its dividend, though chased very closely by the Westminster, and followed shortly after by the Brompton and the others in the London group. The question before directors at present probably is whether they shall deplete reserves and pay the same dividends as a year ago, or whether they shall distribute smaller payments and keep up the appropriations. Last August, it may be recalled, the tendency was in the former direction; and the boards will now have to shape their policy according to their views with regard to the du

It will be noticed that Edison & Swan shares have given way a little after their drive up, when the price went to nearly 15s. The reaction is due to the disclaimer issued in semi-official manner as to the company being largely engaged in work for submarines. The fully-paid shares are unchanged at 24. Electric Constructions are better at 11s., standing now higher than they did when war broke out. The manufacturing shares of the Talegraph group are very firm higher than they did when war broke out. The manufacturing shares of the Telegraph group are very firm.

Telegraph securities themselves are remarkably quiet. There

has been more demand for Eastern ordinary, while Eastern Extensions, at 12t, are the fraction higher on the week. The Anglo-American group is steady, and the reception accorded to Sir Edward Grey's reply to the United States' protest on the subject of contraband has been sufficiently favourable to cause general satisfaction. Marconia after being 14 hovers cause general satisfaction. Marconis, after being 1st buyers, developed a slightly duller tone. American Marconis rose to 1ls., but reacted to half-a-guinea; Canadians remain in the neighbourhood of 4s. 6d.

Brazil Tractions are half.

Brazil Tractions are better at 58, regaining their previous ll. A number of enquiries have reached the market as to

Brazil Tractions are better at 58, regaining their previous fall. A number of enquiries have reached the market as to whether there is any premium to be obtained on the new Calcutta Electric Supply ordinary and preference; but in view of the very slight difference which exists between the old and new, taking the two together, there is no profit at present for the applicant. The rubber market is better, thanks to Sir Edward Grey's promise to raise partially the embargo placed upon exports to the United States. The armament group has no feature to render it conspicuous.

Last Sunday, by the way, the special constables of Wimbledon, Fulham, Barnes and other places received peremptory orders, as they were finishing their dinners, to proceed at once to their points of duty; and power stations, being regarded as amongst the most vulnerable points, received rapid reinforcements from those whose afternoon nap was thus rudely disturbed. The occasion for this call was, of course, the appearance of German aircraft on the French coast; and the R.N.V.R. men, who are in charge of searchlights and guns, spent several exciting hours in watching for the enemy from the high points round London. Reservists and Special Constables were happily disappointed, but the false alarm has revived the previous anticipation of visits from alien air-craft.

NOTES ON SWITCHBOARD ARRANGEMENT AND EQUIPMENT.

[COMMUNICATED.]

AT one time it was customary to regard switchboards and their equipment as a nuisance—necessary but distinctly parasitic, and quite fitly to be placed in any odd corner, too small, or otherwise unsuitable, for any other equipment. Often the boards were much whited sepulchres, architecturally ornate and resplendent in marble and brass, but covering a multitude of faulty points in construction or design. Some of the defects involved only inefficiency; others actual danger to life and property. Painful experience, more frequent in its occurrence as working pressures increased, compelled attention to this matter and brought home the fact that the switchboard is the vital link connecting the generating and distributing systems, so that comparatively trivial switchboard defects may easily suspend supply over a more or less extensive area. Recently switchboards and gear have been accorded respect befitting their importance, but even in modern installations defects in design and arrangement are found which are particularly objectionable and dangerous when, as often happens in industrial service, the board is under the control of a more o: less unskilled attendant.

Frequently one finds a switchboard placed in a gallery "affording a clear view over the engine room" (as the textbooks have it) when there is really no justification for this costly construction. In small stations of the one-man type the switchboard attendant (who probably enjoys the title of "engineer-in-charge," in recognition of the fact that he does everything that needs doing) is near enough to the engines to tell by sound what is happening to them, and that much more easily and certainly than he could tell by eye when in a gallery; and should he have cause to leave the board hurriedly to attend to the engines, it is a distinct advantage to have no steps to descend. In larger works, actual supervision of the engines from the switchboard is necessarily very super-Separate engines and switchboard staffs are required, and intercommunication by signals can be effected as easily from a floor board as from a gallery. In stations of either of the above clas es a lofty gallery is an unnecessary and inconvenient expense, but the switchboard may well be mounted on a platform not more than two or three steps high; this arrangement improves the look of the station, permits the board to be conveniently railed off, and undoubtedly exercises some occult effect in emphasising the importance and sanctity of the board. In large modern stations of the high-tension type, a switch gallery is almost compulsory, owing to the depth required beneath the operating platform for cable races, transformers, and oil switches, &c.

In such stations remote control of engine or turbine valves is usually provided on the switchboard; the switchboard attendants work only on the board itself and find full employment there, and by the switchboard gallery overhanging the turbine aisles, space can be frequently saved as compared with the space required for ground level boards. Some of the low-tension boards controlling local and auxiliary circuits can still be placed advantageously on the walls of the engine room at ground level. The prevailing tendency is to separate generator, feeder, and section panels (to limit the scope of damage), while providing central remote control for all.

In the latest and largest power schemes there is an increasing tendency to locate the main switchgear in a building distinct from the power house itself, even going the length of providing a separate switch house for each generating unit in a large overland scheme. By such isolation the risk of wholesale interruption of supply due to cable and switch fire is much reduced, and the task of isolating and extinguishing a fire is greatly simplified. All pretence at direct engine room supervision from the switchboard is abandoned, and a complete system of signal telegraphs and remote control apparatus is arranged.

Simplicity in any switch installation is an invaluable aid to security, for the risk of trouble increases far more rapidly than the number of pieces of apparatus and component parts on the board. High-tension boards and switchgear

can and must be interlocked very completely, but there is a tendency to overdo the automatic features and "fool-proofing" of industrial switchgear. In some directions foolproofing engenders or encourages carelessness, and even deliberate misuse of apparatus in order to see the automatic features work. Broadly speaking, safety and reliability are best assured by a minimum number of automatic features, all the expenditure permissible being devoted to making these and the fundamental components of the switchgear of the best material and design. The use, on metal parts behind boards, of insulation which might be inadequate under any circumstances, is inviting trouble; the metal concerned had far better be left bare and protected by a mechanical screen, or left obviously dangerous, or earthed, according to circumstances. Bare conductors behind the board reduce the risk of fire to a minimum. Asbestos is a flame-proof covering, but one which is apt to form a good "wick" for burning oil. Bare conductors must be so supported that they cannot be deflected dangerously by the enormous mechanical forces set up by short-circuit in a modern station. Portable electrostatic live wire indicators of the electroscope type should be used regularly by men handling high-tension switchgear and leads; naturally, the instrument should be of first-class design and construction, or it will introduce more risks than it will Doors in the side or back of the enclosure behind the board should be on permanent hinges or slideways wherever possible, and should be interlocked with the main switches in the section to which they give access. doors be of the hang-on panel type, they should be entirely of insulating material with completely insulated reinforcement, if any, otherwise they are likely to cause disaster by coming in contact with live parts.

Low-tension, no less than high-tension, switches should be mounted with all live parts behind the board, and only the insulated handles in front; safety and good appearance are thus alike secured. In the past, on many boards, particularly of Continental origin, live parts on the front of the board have been covered by shields of fibre or papier maché composition, easily damaged mechanically, and subject to rapid deterioration by damp. Such construction is unsightly, unsafe, and altogether false economy. In multipolar switchgear, with mechanically coupled phases or poles, the coupling-piece should be exclusively of insulating material: if it has a metal core, damage to the insulation will probably cause a dead short.

The design of oil-immersed switchgear can hardly be said to have kept pace with the revolutionary increase in power of generating sets and pressures of generation and distribution; the distance between live parts is often insufficient, and the total volume of oil in the box inadequate to prevent overheating. Switch parts should be as light as is consistent with strength, so that acceleration is a maximum for a given operating force, and there is advantage in using a mechanism which gets into motion before the actual break occurs. The containing case should be very strong and fitted with a relief valve, and the cell within which the switch is placed should be of fireproof construction and provided with a drain carrying away oil in case of fracture of the switchbox. Generator switches should usually be non-automatic, but have overload alarms operated by a current transformer; also alarms operating in case of abnormal oil heating. important lines it is not extravagant to provide two switches in series, particularly if fitted with automatic gear, or if used very often or very seldom. Each switch is fitted with a bridging isolating switch, the latter being closed across the main switch which is held in reserve at the moment. Wherever oil switch or other oil fires are liable to occur, plenty of sand should be kept handy, and smoke helmets should be provided, for without the latter it is often impossible to reach the seat of conflagration.

The large generating sets now employed, and the low reactance of generators and transformers commonly adopted for the sake of good regulation, result in enormous short-circuit energy. It is doubtful whether any practicable oil switch can deal unaided with the conditions which may arise in a large modern station, and the alternative to sectionalising, so as to limit the short-circuit energy available behind any one switch, is to use two switches in series, or one special switch, so that supplementary reactance is

inserted automatically before the main switch opens. Earthing the neutral of three-phase systems is desirable so long as steps are taken to limit circulating currents during normal operation and to provide low-resistance earthing when really required. The use of switching-in or charging resistances is now common in all high tension installations, and is particularly desirable when connecting circuits of high inductance or capacity. Without this precaution dangerous resonant cable surges may occur, and special insulation of motor and transformer end coils becomes necessary. The practice of running up a machine with its cables connected is of limited applicability, is crude, and by no means free from Periodic testing of network insulation is a necessary and universal practice, but any method or instrument which gives graduated warning of the imminence and aggravation of faults is specially valuable. The telephone of a phasaphone, for instance, enables one to listen to the charge and discharge of a condenser connected between line and earth through a suitable resistance; irregular or incipient defects cause variations in the telephone note. Any measures leading to the prevention of faults are particularly valuable, since they not only prevent the first interruption of service, but save a further whole crop of trouble. Most central station statistics show that breakdowns occur in groups. The first serious breakdown causes surges which strain or even puncture insulation in other parts of the system; static discharges occur when working is recommenced, and a power discharge soon follows. Once started, there is often quite a long train of serious breakdowns at short intervals.

Instruments of the flange type with body sunk in the board are neat in appearance, easily cleaned and easily read—all advantages of special importance on large boards, and more than compensating for the extra cost involved, Classification of instruments by case diameter is obviously illogical, since the scale is quite likely to be smaller and less clear though the case diameter be larger. It is much safer and more definite to specify either the scale length or, what amounts to the same thing, the pointer length and maximum angular deflection. Such a basis is equally applicable to face Any instrument to be and sector instruments of all types. mounted above eye level should have at least 6½-in. scale length (or, say, 90° deflection of a 4½-in pointer); the advantages of modern long-scale instruments are well known. The merits of induction type instruments for alternating-current working include long-scale and all-glass front showing full pointer length. These instruments are simple and strong, and can be repaired by an ordinary meter adjuster. Their frequency error is high, but this is of no importance in a turbine station; the temperature error, which would be a more serious matter, is capable of close compensation.

The elementary precaution of placing all series and regulating resistances so that convected heat does not reach neighbouring instruments is often neglected, naturally to the prejudice of instrument accuracy. Errors due to this cause cannot always be detected even by in situ tests, for the offending resistances may be cool at the time of testing. Irregular operation of fuses is often traceable to their being mounted with similar disregard for the neighbourhood of regulating resistances; if the fuse is proportioned to carry a certain current when the resistance is hot, the circuit is inadequately protected when the resistance is cold. Induction from heavy current cables six or seven inches away often causes quite serious instrument error.

Instrument change-over switches placing instruments in various circuits or across various shunts are often built so lightly that they give trouble by imperfect contact or, what is more serious, cause short circuit by mechanical fracture. The back contacts of these and other switches should be fully accessible and not covered in by bus-bars or other apparatus. For calibrating purposes it is often desirable to connect standard instruments temporarily in circuit without interrupting operation, and to permit this with minimum trouble and risk, special terminals should be provided on isolating switch or fuse blocks in the first place so that, the current winding being connected, it remains only to open the bridging switch or fuse.

The frequency in modern turbine stations is practically constant, but not infrequently is lower than standard, owing to weakening of the control in the tachometer or other

instrument used. A frequency meter switched in circuit only at intervals to check the regularly employed tachometer is a useful precaution. There is rarely need for a registering frequency meter, but the use of recording volt and wattmeters is in the interests of efficient working and supervision. It is a small matter to planimeter wattmeter records to save the use of watt-hour meters if both are not desirable for any reason; and the wattmeter record is very useful in distributing generator and feeder connections and settling tariff problems. Volt and wattmeter records are useful, too, in detecting and discriminating faulty conditions; for example, branches touching overhead lines cause smaller fluctuations than fallen wires or insulator defects, and imperfect contacts such as often occur in open-air hightension isolating switches, cause violent fluctuations on voltmeter records but little on wattmeter records.

The design of good instrument transformers is now generally understood but not always practised. For trip coils and relays, accuracy of transformer ratio and phase are of minor importance, but for use with measuring instruments very light portable transformers are generally unsuitable. In large systems, transformers with small primary capacity may be destroyed by the mechanical forces set up during short circuit; specially heavy design is essential, and the secondary load should be as light and constant as possible, to secure highest accuracy. Often an installation can be cheapened and simplified by using one transformer for several instruments; the transformer should be designed liberally, so that an extra instrument can be connected to it at any time (the possibility of so doing will often be of great practical value). A single current transformer may supply a number of watt-hour meters, but should not be connected to other apparatus as well. Not infrequently it is neglected to earth the secondary measuring circuit, or otherwise make it impossible for the low-tension circuit to become "live" with high-tension current. A danger equally fatal and more serious in that it exists under ordinary working conditions if not safeguarded, is that of generators and leads being kept alive after the main switch is opened, by induction through synchronising transformers. The obvious remedy is to place an isolating switch ahead of all potential transformers, interlock ng this switch with the main circuit switches. Besides fusing the primary side of voltage transformers, low-tension fuses should be placed in the secondary circuit to protect against incorrect connection, incorrect earthing, or short circuit, in leads or instrument. instruments connected directly to bus-bars or mains should be fused, for the same reason.

AUTOMATIC PROTECTIVE SWITCHGEAR FOR AUTOMATIC CURRENT SYSTEMS.

By E. B. WEDMORE, M.I.E.E.

(For abstract of paper read before the Institution of Electrical Engineers, see Elec. Rev., p. 37.)

Discussion in London.

Mr. C. H. Merz said that all these devices had been developed as the result of experience, which had shown the need of them. On the North-east Coast they were deeply interested in the matter as a commercial question. They had many long transmissions, and the system had naturally developed into a series of interconnected ring mains, supplied from substations with attendants; in order to maintain continuity of supply in the event of a fault occurring, they had to have automatic apparatus that would cut out the faulty cable, no matter which way the current flowed. The result was the development of systems of protection. The conditions were different in the United States, where the distribution was largely by direct current through rotary-converter sub-stations; radial feeders were laid with each sub-station, and attendants were employed, so that ordinary overload devices were sufficient. In this country the tendency was to supply important consumers with three-phase current through static transformer sub-stations, hence the necessity for selective devices. The real question was not the cost of a particular piece of apparatus, but whether it was possible to improve the lay-out by using it and thus save perhaps 100 times its cost.

Mr. H. W. CLOTHIER said that the paper contained the condensed results of twenty years' work. It was difficult to induce the users of cables to think out the problems involved and to become themselves "selective." It was important to consider the case of T mains, as at J in fig. 1. Mr. C. H. MERZ said that all these devices had been deve-

Core-balancing on switchgear had been adopted extensively four years ago, and at least 100 circuits, to his knowledge, were protected with it to-day. Messrs. Merz and Price themselves did not fully realise the value of the system at first. He did not like the balanced relay system as applied to the case of parallel feeders; with regard to interlocked reverse-relays, he agreed with the author, and was surprised that they were still specified. Systems of protection of parallel feeders had a tendency to open the wrong switch in the event of a fault on open circuit, and they were useless where there were T mains; the situation might be saved by the split-conductor system. He agreed with the author's conclusions regarding the split-conductor system for feeders; it was new to the public, but over 100 miles of cables and overhead mains were protected by it. On a system of some 50 miles of cable, it operated 40 times in the year, and only once had it failed; on that occasion the system was not to blame, the failure being due to a fault in the mechanical construction.

had it failed; on that occasion the system was not to blame, the failure being due to a fault in the mechanical construction.

Mr. A. M. Taylor regarded the subject from the point of view of the switch-gear engineer in a municipal undertaking. Referring to the author's conclusions, under (a), the remedy which the author gave for the protection of all closed feeder circuits was a split-conductor system, but unfortunately in municipal work that was of no assistance in regard to existing feeders. They had to deal with feeders running from a generating station to numerous sub-stations, in many of which were rotary converters. These feeders were mostly run which were rotary converters. These feeders were mostly run which were rotary converters. These feeders were mostly run in triplets, but occasionally in pairs, and sometimes in sets of four, throughout the city, and the author's suggestions in regard to closed feeder circuits, which these were in some cases, did not help them because they could not rip up these feeders and put down split-conductor arrangements. Neither could they throw two existing feeders together under Neither could they throw two existing feeders together under one switch and call them a split-conductor arrangement, because that would have the disadvantage that both feeders would be thrown out of gear for a fault on either of them, and they would be worse off than at present. With reference to the author's arrangement of overload relays, in which the relays operated with the load current plus the fault current, or rather a sub-multiple of it, the author did not mention, except incidentally, the fact that it was not necessary in the case of every fault, say for instance one three-quarters of the way along one of the feeders to the sub-station; that the current to the fault should return from the sub-station. In fact it was purely a question of the relation between the load current and the fault current and the potential of the feeder at the point where the earth occurred that determined whether the current should flow back from the substation bus-bars to the fault or whether the faulty feeder should carry the load current past the fault on to the substation. The author had impressed upon them the desirability station. The author had impressed upon them the desirability of cutting down the amount of fault current by the insertion of a high earthing resistance in order to reduce the shock to the system. To whatever extent they reduced the fault current, to that same extent they made the apparatus unreliable and introduced the possibility of the wrong feeder being pulled out. In fact the system would be the more reliable the bigger the fault current which was allowed to flow. On the other hand, one great virtue of the author's overload interlocked arrangement was the fact that if a short circuit developed between phases on any feeder (or apparatus connected with any feeder) the faulty feeder was instantaneously nected with any feeder) the faulty feeder was instantaneously cut off without waiting for any overload relay to operate. In a case where four parallel trunks ran between two generating stations, that was practically an interconnector consisting of four parallel trunks, he did not see why an arrangement consisting of a core-balancing transformer at each end of the four trunks operating in each case on an independent relay, supplemented by overload relays on each phase of each feeder in the ordinary way as a stand-by, should not be a quite satisfactory solution; it would be very simple because the feeders were already equipped with overload relays and the core-balancing transformers could be added round the feeders without introducing any further element of weakness. It appeared to him that where there were four feeders in parallel, no matter on what part of any of these feeders the fault might occur, there must always be three times the fault current through the sub-station relay on the faulty feeder that there was through the relays on any of the other three, that there was through the relays on any of the other three, which should sufficiently discriminate between them, the sub-station end of the faulty feeder only being pulled out. Directly this was done the generating station end would follow. Since the arrangement was absolutely reversible it did not matter which was the generating end and which was the sub-station end, the generating end at any instant being always understood to be the one from which energy was most likely to flow to the fault.

Mr. WATERS described a new balancing relay system which permitted T connections to be made off one of two cables; he also described an automatic reverse-current device, with the aid of diagrams.

he also described an automatic reverse-current device, with the aid of diagrams.

Mr. A. G. Collis said that the author used the term "ing stantaneous." but actually a relay took 0.4 second to operate, and the switch 0.6 second to open, making a total of one second; hence the circuit was not interrupted until an appreciable rise in the current took place. The author's reverse-current was 180 degrees out of phase; what would be the effect of a current 90 degrees out of phase? It was stated that fuses had no discriminating value, yet they were shown in one of the figures.

Mr. H. Brazil inquired as to the cost of the split-conductor cable, and the method of jointing such cables, and referred to the thickness of insulation between the two cores, which might the thickness of insulation between the two cores, which might be subjected to a pressure of 6,000-volts in the case of a fault on an 11,000-volt cable. He said it would be difficult to find a fault thus caused between the cores. Referring to overload devices on earthed feeders, which would require an earthing resistance to carry, say, 800 amperes, if a resistance with a negative characteristic were used it could be set at 300 amperes; if the cut-out did not act at once, the current would increase until it attained a sufficient value

a negative characteristic were used it could be set at 300 amperes; if the cut-out did not act at once, the current would increase until it attained a sufficient value.

Mr. Murphy said that reverse-relays had been greatly improved and could be relied upon nowadays; the relay was pretty sure to act before the voltage dropped to zero. The use of reactances in the line gave reverse-relays a better chance to act satisfactorily. The circulating-current system was more complicated than the reverse-current relay, and introduced the risk of shut-down due to breakage of the instrument connections, a matter which was as serious as failure to operate. He described a device for protecting parallel feeders or ring mains in existing networks by using the combined effects of excess current and drop of voltage.

The Author, replying to the discussion, said that many engineers in the United States were beginning to pay attention to the design of relay systems. The balanced relay was not included in his summary of ideal systems, but had its uses. Where the Merz-Price system could not be employed, the systems described in the paper for protecting parallel feeders afforded the best protection. The system described by Mr. Waters only dealt with faults to earth. In reply to a question put by Mr. Collis, the core-balancing system cleared cable faults with the minimum risk of the arc coming outside the cable. The insulation between conductors was only "light" compared with the full insulation; Mr. Brazil was correct regarding the full star voltage occurring between the cores for a moment. His suggestion of an earthing resistance with a negative coefficient was interesting, but a few seconds was too long to wait. Mr. Murphy's device would require adjustment on site, and re-adjustment after any change in the circuits. in the circuits.

DISCUSSION AT BIRMINGHAM.

The discussion was opened by Mr. A. M. TAYLOR, who dwelt upon the advantages of the split-conductor system as compared with core-balancing systems. In continuing the discussion, Dr. GARRARD pointed out that the Merz-Price system did not protect against bad synchronising but only safeguarded a system against faults to earth. The balanced relay

was superior in this particular.

Mr. S. T. Allen said that the system under his management was not fitted with any other protective device except the usual inverse time characteristic overload devices. The system contained about twelve miles of E.H.T. feeders, and had operated without any failure or trouble for some years.

Mr. CLOUGH said that he did not think it desirable to have contrained devices on generators.

Mr. CLOUGH said that he did not think it desirable to have overload devices on generators.

Mr., Orsettich objected to the tendency to elaborate protective devices. It was better to work in the direction of so simplifying the systems and machinery that they were robust enough to withstand the consequences of minor faults.

Mr. Hollis did not agree with the abuse showered on pilot cables, but thought they were quite satisfactory for many

purposes.

Mr. Groves advocated that more attention should be given to the protection of bus-bars. The devices described in the paper looked after the cables, but left out the bus-bars.

In a written communication Mr. WITCHER thought it desirable to emphasize the distinction between systems which operated on faults to earth and those which operated on faults between phases. He also expressed regret that the author of the paper had not developed the discussion of the split-conductor principle more along the lines of unequal splits.

DISCUSSION AT MANCHESTER.

MR. WELBOURN agreed with the author's conclusions with the exception of (b), which was open to argument because, as stated by the author, the core-balancing system appeared to depend on the gamble that the fault would be a fault to earth and not between phases. The recommendations of the author were based on technical grounds, and no comparison of costs were the statement of contractions. of the author were based on technical grounds, and no comparison of costs was given; this was an element which could not be disregarded. The split-conductor system had some undoubted advantages over the Merz-Price system when dealing with overhead line protection. It was free from the difficulties inseparable from slinging up an insulated cable all along the route, also it was free from having the equivalent of an earthed conductor below the line which could be fouled in the event of a line breakdown. Moreover the split-conductor system had the advantage that on breaking a conductor, the relays would operate and render the overhead wires "dead" long before they could come within reach of the ground.

Mr. S. Ferguson said that there were certain systems where overload devices were used together with a 3-pole high-

overload devices were used together with a 3-pole high-

resistance earth, and if a fault occurred to earth the overload device was useless; for this reason the two things should be considered jointly. The time limit on leakage devices would appear to destroy some very important advantages of the balanced system, as it had always been said that one important feature of the system was its instantaneous action. Further, the balanced system of protection dealt with a current much less than on overload protection, and if a time limit were introduced, the fault current would be reduced. A remarkable thing about the author's conclusions was that overload did not figure at all, whereas for many years everybody had pinned their faith to overload devices. The system seemed good, but it depended upon the two conductors body had pinned their faith to overload devices. The system seemed good, but it depended upon the two conductors carrying equal current; if a fault occurred in a sub-station, the inequality was very small. Regarding the protection of open-ended feeder circuits, the balanced system was almost useless if the neutral was not earthed, except in very large systems such as Manchester with a considerable capacity current. Overload protection seemed absolutely necessary in addition to core-balancing. A useful combination which had proved satisfactory was to provide overload protection on two phases to protect against shorts, the remaining phase taking care of the out-of-balance current. The Merz-Price system was unquestionably the best for generators and transformers. was unquestionably the best for generators and transformers, although trouble might occur in lock-up sub-stations due to the relays operating on resuming supply after a shut-down. Mr. A. E. McKenzie said that in Manchester ten sets of

balanced protection gear had been installed without an earthed neutral, and as stated by Mr. Ferguson, the capacity current was quite sufficient to ensure the necessary operation. Unfortunately most stations had their high-tension feeders already laid with no provision for pilot wires for operating Merz-Price gear; in such cases the author's recommendations Merz-Price gear; in such cases the author's recommendations were to be thoroughly endorsed. He agreed with Mr. Ferguson in condemning time-limit devices on balanced protection, and cited a case where tremendous damage occurred on a feeder protected by overload protective gear with a one-second time limit. Balanced protective devices in series were unnecessary, as the number of faults on a properly-laid cable system did not warrant the expenditure. The Manchester Corporation system had over 150 miles of extra-high tension cable, and the number of faults per annum was about six. The turbo-alternators and large generators at Stuart ix. The turbo-alternators and large generators at Stuart Street, Manchester, were protected by Merz-Price gear, fuses being placed in the secondary circuit so that these devices would blow only if a machine was kept on sustained short-circuit or if a fault developed on the machine windings causing current in excess of the normal short-circuit of the machine to be sent in from the other generators. It was therefore quite possible to protect machines against faults on windings or on the machine entitle based on the machine state. on the main switchboard. Regarding the interlocking of parallel feeders, he had not yet found a satisfactory reverse relay, and consequently where a number of feeders fed a sub-station, it had always been considered advisable to separate the high-tension bus-bars and run as many different sections as possible. The interlocking devices described in the paper were worthy of a trial. In the speaker's experience it had always been found advisable to have a small switch in the secondary circuit of the balanced protective gear, which could be opened temporarily whilst parallelling two feeders going to the same sub-station. No matter how quickly or accurately the switching was done, one phase made contact before the other, and the capacity current caused the relays to operate. His ideal protective gear for generators was Merz-Price balanced protection, with fuses in the secondary, and a device to cut off automatically the field immediately the main switch was opened. Referring to alternator protection, whilst the author's idea of a transformer in one phase was theoretically all right, it seemed more simple to place it on the neutral end of the winding which would probably be outside the casing. This arrangement had been decided upon for the protection of generators in the new Barton. Station Manchester, and consequently the result. place it on the neutral end of the winding which would probably be outside the casing. This arrangement had been decided upon for the protection of generators in the new Barton Station, Manchester, and consequently there would be no switch-gear between transformers and machines. The machine would generate at 6,500-volts and the transformers step up to 33,000 volts which would go directly through the switch to the main busbars. Merz-Price gear would be installed between the neutral of the outgoing switch and the extra-high-tension transformer. In the event of a fault occurring on either transformer or generator winding, the protective gear would onen the main switch and cut the field off the generator. Transformers would be in duplicate so that in case of breakdown, a generating unit would not necessarily go out of commission. The split-conductor system scened ideal for overhead construction. The speaker thoroughly endorsed the author's recommendations in paragraph (b) of his conclusions.

Mr. K. M. Faye Hansen said the core-balancing principle was excellent, but should be used in conjunction with an overload device. The biased protective relay was a thoroughly sound practical idea. The author's arrangement of protecting transformers and alternators in series by having two parallel circuits was interesting, and took care of the case where breakdown occurred between different parts of the same machine, which the ordinary Merz-Price arrangement would not protect against. Merz-Price gear should not be used alone for the protection of alternators. Regarding the split-conductor system, since the introduction of concentric cable, the risk of both conductors breaking down to earth was minimised, and the system should have a wide field.

Prof. E. Marchant said a very sound maxim was laid down some years ago by Mr. Merz to the effect that no protective device was worth putting in if it led to an increase of risk to the plant which it was designed to protect. The split-conductor system did not lend itself to any criticism from this point of view. If the insulation between the inner and outer conductors was very slight, and a breakdown to earth took place on the outer, it seemed probable that the inner conductor would earth and the split-conductor system would fail to protect. The same applied when two overhead lines were earthed simultaneously.

MR. S. L. PEARCE said that Manchester had an extensive experience of protective systems which could be summarised under four headings. First, any consumer's fault, however severe, should be cleared without upsetting the system. The severe, should be cleared without upsetting the system. The same remark applied to the regular public supply sub-stations. Thirdly, the feeder at the main generating station should not be brought out except in the event of a fault to earth on any one of the three phases. Lastly, the main generators ought not to be brought off the main bus-bars through any fault on a feeder or on consuming devices, but only in the event of a fault on their own windings. Coupled with this last point was the precaution rightly emphasized by Mr. McKenzie. It was no use taking care to have the generator switched off the main bus-bars if the field was not cut off as quickly as possible. This applied particularly to the present type of machine with forced ventilation. Unless the field was cut off almost instantaneously, the destruction of the genetype of machine with forced ventilation. Unless the field was cut off almost instantaneously, the destruction of the generator, whether on the bars or not, was bound to follow. Regarding the Merz-Price and the Merz-Hunter split-conductor systems, the speaker had no experience of the latter, but believed the initial difficulties had been overcome, and it should be the cheaper proposition of the two. The only question was that of jointing, and cable-makers would say that it was not applicable to all voltages and every size of cable decided upon. The only alternative was the Merz-Price. Having regard to the magnitude of the stake, be did not that it was not applicable to all voltages and every size or cable decided upon. The only alternative was the Merz-Price. Having regard to the magnitude of the stake, he did not think the relative cost of protective systems ought to be considered. Regarding the protection of duplicate feeders, a new system known as the Ferranti-Waters system seemed to be making headway and was possibly a coming rival to the split-conductor system or the Merz-Price system.

THE AUTHOR in reply said that contrary to the impression of certain speakers, he had stated that he recommended core-balancing devices with overload devices. Regarding instantaneous operation, it was quite practicable to make core-balancing apparatus work in 1/20th second including the time taken by the relay. The cost of the split-conductor system was at present comparable with the Merz-Price, and was bound to come down. Inherently the system was system was at present comparable with the Merz-Price, and was bound to come down. Inherently the system was cheaper than the Merz-Price apparatus. Only in the case of the core-balancing leakage device had a time-limit been recommended. The leakage current on a system with the middle point earthed through resistance would represent only a temporary overload on the machine, and did not subject the system to severe shocks. If it was desired to discriminate between individual feeders and consumers' premises, the time-limit core-balancing device on the feeder in conjunction with instantaneous core-balancing devices on the consumers' premises would give the desired result. The split-contact switch was an innovation on purely commercial lines, the net cost of the switch, plus the relatively small transformers required, being much less than in the case of the solid control switch with relatively large transformers. The split-contact switch was not a necessity, but used a much simpler transswitch with relatively large transformers. The spin-contacts witch was not a necessity, but used a much simpler transformer with bar primary. The split-conductor system represented a considerable advance on the results obtainable with the Merz-Price system. It was generally recognised that with the latter on a large system, it was impossible to use settings below normal load current. The methods of attaining the hallower in the child conductor system were first that it settings below normal load current. The methods of attaining the balance in the split-conductor system were so fine that it would trip out on a few amperes and yet be balanced against dead short circuits on a very large system. There were many miles of overhead wire and cable operating on the split conductor system, and for forty faults successfully cleared there was only one failure, which was due to a bad joint and not to any deficiency in design. The automatic field switch referred to by Mr. McKenzie should be made dependent upon the combined action of the device which tripped the switch itself, that is to say, the field switch should not come out immediately the relay operated. On the other hand it should not come out immediately the switch opened, as in that case a machine could not be got off without opened, as in that case a machine could not be got off without shutting down. The operating current for core-balancing relays was about 10-amperes, and where a much smaller setting was required the current transformer was of very moderate dimensions. It was quite safe to employ very much less insulation between the two halves of the core than the general insulation of the core than the less insulation between the two halves of the core than the general insulation of the conductor. At least one case had occurred where both cores were damaged by a pick and the operation of the protective device had not been hindered. The Ferranti-Waters system had introduced some novel and interesting features in relay design. The system actually appeared in the paper under the head of interlocked relays, overload and reverse-current relays and leakage relays. In the author's opinion, interlocked systems were the best methods of dealing with existing cables. In such cases conductors could not be split and frequently Merz-Price pilot wires could not be inserted.

NEW ELECTRICAL DEVICES. FITTINGS AND PLANT.

G.E.C. Ironclad House-Service Set.

It has been the practice in the past in connecting up house service cables to the fuses, to provide a separate scaling trough and pair of ironclad fuses. The GENERAL ELECTRIC Co., LTD., of Witton, Birmingham, have now introduced a self-contained ironclad out-out set, consisting of a pair of 10-ampere porcelain clad Home Office type out-outs mounted in a cast-iron case which forms part of the main casting of the sealing trough, this latter being split. Care has been taken to provide every facility for wiring up and fixing; no parts have to be removed for screwing to the board

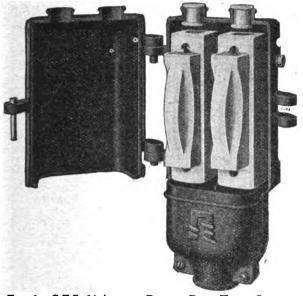

Fig. 1.—G.E.C. 10-AMPERE DOUBLE POLE HOUSE-SERVICE CUT-OUT SET, OPEN.

on which it is mounted, and the cable is taken straight from the sealing trough into the bottom terminals of the porcelain clad fuses. With the cover open it is impossible accidentally to touch any live part. Weighing 5 lb., and having overall dimensions of 9½ in. long × 5½ in. wide × 3½ in. deep, the set is far more compact than the usual arrangement, and should find considerable use among supply authorities, especially as it is less costly than the older arrangement. It is available in both side and bottom entry natterns.

Indirect Lighting.

The British Thomson-Houston Co., Ltd., of Mazda House, 77, Upper Thames Street, E.C., have sent us their new "Eye-Rest" list No. 10550, from which we note that the system has made such progrees, that 40 pages are now required to hold particulars of the many new patterns and adaptations of this system of indirect lighting; whereas the list issued in 1912 described two types of fittings only, the new list contains particulars of about 50 different types. The system depends for its efficiency

FIG. 2 .- "EYE-REST" FOUR-LIGHT FITTING.

on X-ray reflectors, which are claimed to be the most efficient reflectors made; the coming of the Mazda "Half-Watt" lamp has naturally had a big effect on the use of "Eye-Rest" lighting, and the new list illustrates and prices a complete range of fittings to accommodate these new lamps. A number of reproductions of "Eye-Rest" installations are shown, taken by the unaided light of

the Mazda lamps. To meet the objection held by some people, the Mazda lamps. To meet the objection held by some people, that the light source cannot be seen, new types have been introduced with the lower half of the bowl made luminous by means of an auxiliary lamp of low candle power; this translucent part of the bowl can be supplied in a number of pleasing colours. There is also a dining-room pendant type which is supplied to meet the need for the conventional silk shade fitting, with a small lamp and reflector to illuminate the table and silk shade.

A special hospital fitting has been designed, with a glass cover, to keep out dust and reduce cleaning to a minimum. Another adaptation of the "Eye-Rest" system is its application in flambeau form, with from two to six flambeaux; an ingenious connection box for wiring forms part of the decoration.

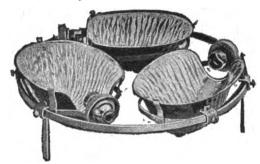

FIG. 3.—ARRANGEMENT OF THREE X-RAY REFLECTORS.

The system has been applied to portable standards, for floor or table use. There is also illustrated a very clever pull switch for fixing to "Eye-Rest" bowls containing a number of lamps, operated by a ball chain hanging from the centre. In some cases the fitting has to be lowered for cleaning, and a two-contact gear with a pulley is shown for this purpose. Illumination data with regard to "Eye-Rest" lighting are given, and there are tables showing the watts per sq. ft. for different classes of installations, and the length of drop required for various sizes of rooms, according to which particular type of X-ray reflector is used.

We illustrate, in fig. 2, a four-light fitting, and in fig. 3 the internal arrangement of the reflectors of a three-light fitting.

The County Lantern.

We have received from the GENERAL ELECTRIC CO., LTD., of 67. Queen Victoria Street, E.C., particulars of the County half-watt street lighting lantern. This is provided with a Holophane globe and the distribution curve, fig. 4, taken with a 200-watt Osram half-watt lamp, gives a remarkably wide angle of illumination.

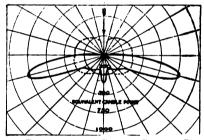

FIG. 4.-DISTRIBUTION CURVE, COUNTY LANTERN,

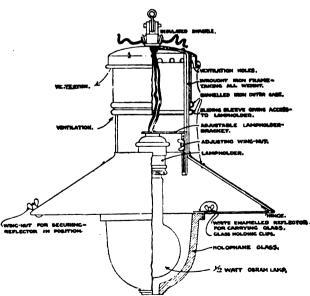

FIG. 5.—SECTIONAL VIEW, COUNTY LANTERN.

Two interesting features are a sliding sleeve, giving free access to the lampholder, and an adjustable bracket to which the holder is attached, enabling perfect accuracy of focusing to be obtained these points are clearly shown in fig. 5.

The lantern is finished in either vitreous enamelled or stove

Japanned iron.

We may remind our readers that the company has an illuminating engineering department, specially to advise on the carrying out of illumination schemes of all kinds.

LEGAL.

WORKMEN'S COMPENSATION.

On January 6th, in the West London County Court, application was made to his Honour, Sir W. Lucius Selfe, sitting with the was made to his Honour, Sir W. Lucius Selfe, sitting with the Medical Referee, for an award under the Workmen's Compensation Act in favour of W. H. Daniell, living with his parents at 21, Glenrose Street, Fulham, an apprentice with Messrs. Marryatt and Macnaught, Ltd., electrical engineers, Askew Works, Shepherd's Bush, who were respondents. On behalf of the latter, Mr. W. Shakespeare, barrister, submitted that the injury on which the applicant relied did not arise out of his employment.

The facts stated were that on the 18th May last, Daniells went into the employ of the company at 4s. 6d. a week. He worked on till June 6th, when one of the other apprentices was showing him what a lathe was used for. To illustrate this he fastened a spanner in the chuck and then turned the belt on to the driving pulley.

in the chuck and then turned the belt on to the driving pulley This was running at 1,400 revolutions per minute, and the result was that the spanner flaw out and struck Daniells in the left eye, which was completely destroyed. Applicant gave evidence to this effect, and in cross-examination stated that he was not aware of the rule in the works that he should not speak to others while at work, and that when he wanted to know anything he should ask the manager or the foreman. Brooks, an apprentice working on a lathe next to Daniells, said that he frequently showed applicant the working of the lathe. To show him that only round articles could be turned in the lathe, he put in a spanner and fixed it in the clutch. Then he switched on the belt, which he thought was on the slow pulley, but it was in fact at top speed—1,400 revolutions a minute. The spanner flew out and caught Daniells in the left eye. His Honour held that the boy had been hurt while in the course of his employment, and seeing that the medical referee stated that he was again fit for work, awarded him 4s. 4d. per week from Jane 6th till date, with costs.

PLUTTE, SCHEELE & Co., LTD., r. HUDSON, SHEED & TOWELL, LTD. In the City of London Court, on Friday, Messrs Plutte, Scheele and Co., Ltd., electrical accessories manufacturers, 18-19, Queenhithe, sought to recover £4 13s. 4d. for electrical accessories supplied to ers. Hudson, Sheed & Towell, Ltd., art metal workers, 9, Newman

Mesers. Hudson, Sheed & Towell, Ltd., art metal workers, 9, Newman Street, Oxford Street.

Mr. Pearce, plaintiffs' solicitor, said that the defendants admitted owing the debt; but they would not pay it on the ground that plaintiffs were alien enemies. Plaintiff company was registered in England and carried on business in London. That was sufficient to enable the plaintiffs to recover.

Defendants' representative told the Court that the plaintiffs

ere alien enemies, and for that reason they did not want to pay

the money to anyone who was fighting the country.

JUDGE RENTOUL: That is most patriotic.

MR. PEARCE observed that the money would be paid to English-The majority of the shareholders were naturalised English-

MB. JONES, plaintiffs' sales manager, said there were four or five shareholders. The plaintiffs were before the Court in August, when the Court ordered money to be released in their favour in other litigation.

Other litigation.

Defendants' representative added that the goods were supplied in June and July. At Somerset House they found that Alexander Plutte and his wife held £4,765 shares and F. Plutte held £845. Both the Pluttes had gone to Germany to fight England.

MR. JONES said that E. Plutte had left the country, but F. Plutte, the founder of the company, was a naturalised British subject and was in London.

JUDGE RENTOUL: Naturalised!

MR. Pearce said that the plaintiffs would undertake not to part with the money to Germans.

Defendants' representative said that the two Germans who had field the country were both directors of the company as well as shareholders.

JUDGE RENTOUL: They will do no harm now that they are away.

Defendants' representative: But they remain shareholders,
JUDGE RENTOUL: His Majesty has a first cousin, and we do not
know how things are mixed up. There must be judgment for the plaintiffs with costs.

A MOTOR-CYCLIST'S CLAIM.

INTIMATION has been made in the Court of Session of the settlement of the action by a Glasgow manufacturer, against the British Thomson-Houston Co., Ltd, Glasgow, and the District Committee of the Middle Ward of Lynarkshire, for £500. Pureuer, while riding a motor-cycle, ran into a heap of road metal and tarmacadam and sustained serious injuries. The British Thomson-Houston Co., Ltd., were laying a tramway in the neighbourhood.

Pursuer has accepted a tender of £300 and expenses.

DOUGLAS v. PELICAN.

In the Shoreditch County Court, last week, before his Honour Judge Cluer, Benjamin Douglas, of Hackney, an electrician and decorator, sued Harry Pelican, of Stratford, to recover £6 for work done and wages. Plaintiff's case was that he had electrical work, &c., to do, to the amount of £1, and had received £9. He claimed the belenge of £1 and £2 for a week's work at Stratford. claimed the balance of £4 and £3 for a week's work at Stratford. claimed the balance of £4 and £3 for a week's work at Stratford. When he asked for his money, he got a complaint that the work at Stratford was not carried out properly, but that was untrue. He was laid up for a week after working at Stratford, and when he returned he was refused employment. It was the electric light wiring that he was told was complained of. It was untrue, he said, that a Borough Council inspector came to the place and condemned the work, because it was not covered with insulated tubing in accordance with the Board of Trade regulations. Plaintiff said he had asked the defendant for more tubing, but was refused it on the ground ance with the Board of Trade regulations. Plaintiff said he had asked the defendant for more tubing, but was refused it on the ground that he had sufficient. It was true that an account was opened in his name with a firm for the supply of tubing by the defendant, but he denied that he could have ordered what he liked. Plaintiff positively denied that he saw the officer of the West Ham Council more than once, and then no complaint was made as to the work. Since that time he had done other work which had been passed by the Council officer. The officer never said anything about it being dangerous to life and limb, or that it would have to be covered with Simplex tubing. The defence was that the work had not been carried out properly, and would cost a lot to put right. Judge Cluer upheld that view, and gave a verdict for the defendant with costs. defendant with costs.

NEW PATENTS APPLIED FOR, 1915.

(NOT YET PUBLISHED).

Compiled expressly for this journal by MESSRS. W. P. THOMPSON & Co. Electrical Patent Agents, 285, High Holborn, London, W.C., and a Liverpool and Bradford, to whom all inquiries should be addressed.

IN PREPARATION.

H. Alabaster, Gatehouse & Co., 4, Ludgate Hill, London, E.C.

CAB-SIGNALLING AT THE "MECHANICALS."

THE strongest impression brought away by one visitor to the discussion on "Cab-Signalling" at the Institution of Mechanical Engineers on the 18th of last month, was regret at what seemed to be the missing of a great opportunity in what is, undoubtedly, a crisis in the agitation for the provision of this method of signalling as an additional safeguard to railway operation; and candour forces the confession that this regret is justified by a perusal of the discussion as it appears in the pages of the Journal.

It is well known that the Board of Trade Inspectors recently recommended the Board of Trade to call upon the railway companies to carry out experiments with different systems of cab-signalling and automatic control, with a view to the selection of some such method suitable for universal adoption, and they added that they held "that some system of this description should be generally adopted in the It is also an open secret that a Committee is now considering the question of cab-signalling, together with other matters relating to railway operation.

This being the case, it might have been thought that the opportunity provided by the Institution of Mechanical Engineers would have been seized upon to thrash out the requirements of such systems. Five papers were presented, which were divided by one of the speakers into three divisions-two dealing with the subject theoretically, two dealing with practical systems, and one outside the scope of cab-signalling proper. Leaving the last paper out of account, the two theoretical papers may be dismissed by saying that they put forward nothing that was new or useful, and that they smelled more of the lamp than the footplate.

The papers described as practical dealt with two well-known systems—practically the only two designs which have any chance of adoption in this country—the differences between which are such as to indicate clearly two distinct schools. Moreover, this was the first occasion on which they had been put forward for consideration together. In the one system the designers seem to say: We will advise the driver of the position of the distant signal as he approaches it, and, further, if the signal is "on" we will apply the brake, to a certain extent, for him; we will not give him any further information whilst he is passing forward under the control of signals, and we will leave him in complete control of the indications he receives and of the brake after its automatic application. In the other system the designer seems to say: I will provide an automatic indication at some point before the driver reaches the distant signal, so that the driver may have his attention drawn to the fact that he is passing into a signal-controlled area, and give him an opportunity to look specially for the line signal if the conditions are such as to obscure it; at the distant I will further advise him of the positions (collectively) of the "stop" signals, and if they are "off," and their position is at a diverging junction, I will advise him which road, at the junction, is prepared. I will further arrange to keep control of the train throughout the signal-controlled area, so that he shall not be compelled to rely only upon his vision for further necessary indications after passing the distant. The apparents sary indications after passing the distant. The apparatus shall be capable of giving a "line clear" indication between the distant and the home (combined with route indications), and emergency "danger" indications at that point and at all the "stop" signals. The apparatus shall show a danger indication when the engine is standing at a "stop signal at danger and will be capable of receiving an "off" or a "calling-on" signal, as the case may be, at the home signal, and the latter indication shall continue to show its cautionary character after passing the home and up to the advance. Both the "off" and "calling-on" indications at the home will be combined with the appropriate route indications at a diverging junction. Lastly, I will give an "off" indication at the advance, and this indication shall be independent of any indications given behind the home signal. In the indications thus provided for there is not more than is now provided by accurate interpretation of the line

Such, roughly, is a comparison of the results apparently aimed at under the two schools of thought, and which might have been expected to furnish the basis of a useful and instructive discussion which would have given a much needed lead to the Committee considering the subject with a view to legislation, or the issue of directive orders to the railway companies. Notwithstanding the memorandum to which reference has already been made, it is not likely that the Board of Trade will endorse the "selecting of some such method suitable for universal It is not likely that a selection of any system will be made. That would be for the Government to depart from all tradition, and English Governments are largely guided by precedent. To select a system for "universal adoption" is to discount all future invention, and the Government has wisely, in the past, left railways free to use whatever apparatus they please provided that they achieve the results demanded. This is shown conclusively by the many types of block telegraph apparatus in use. But a many types of block telegraph apparatus in use. Government can say what results must be obtained; how the results are obtained is not material except to those who have to produce them. It was the opportunity to give the Government the considered reasonings of those who favoured one set of results or the other which was missed during the discussion.

Instead of a useful discussion on lines such as are here suggested, one found that individualism and the desire to score were rampant, and for the most part, the remarks made seemed to have no reference whatever to the effects desired for the guidance of the man on the footplate. Instead, there was a good deal of "fencing," a good deal of hesitation and a good deal of what is too difficult to describe in writing. One gentleman, whilst avowing himself an advocate of cab-signalling, was chiefly concerned to find objections to it. Another gentleman had been until recently of the opinion that only one system—the Great Westernwas worth looking at, but whilst he now seemed deeply impressed with an inductive signalling method, his remarks did not disclose any whole-hearted belief in its entire effectiveness, and he went on to suggest that the present outdoor visual signals, "the very first thing devised," were really the best. Another thought the driver might be tempted improperly to use a switch, and on that point the author of one of the papers agreed with him, forgetting, apparently, that the same thing could be done with the apparatus he had described. The question was asked whether cab-signalling enabled trains to run to time in foggy weather (in a discu-sion dealing with safety of running). One of the authors described the "astonishment" at Paddington when several trains arrived to time during a fog, after the apparatus had been installed (the installation covered a distance of about 30 miles.) Another gentleman was Another gentleman was anxious to tell the meeting that the railway with which he was connected was experimenting with audible cab-signals, and had actually been able to -dispense with a battery on the engine.

And so the discussion went on. Visual signals were ina lmissible, because they took the attention of the driver off the line, which might be encumbered with platelayers' trolleys, cattle and other wild fowl which are so plainly visible to a driver at night time: cab-signalling would not prevent mistakes by signalmen: with the -- system the driver was not told that the signal was at danger when it was at "all right." Consider the criticism and answer in connection with the Great Western Co.'s system :-"....

he noticed from the description of the apparatus that the signal was held up at 'line clear' by the local battery situated on the engine. When the engine passed over the ramp, the circuit was broken and the signal dropped to danger. If the ramp were energised it picked up another current and received the 'line clear' signal again. It would be seen that the armature must be rather light, otherwise a very big battery was required or the armature would drop off through the shaking of the train. He concluded that the construction was of a rather light character. If that was so, the parts might stick either through corrosion or the presence of oil, or something similar. In that case, the switch would not give the danger signal. Another point was that, although brass pegs were probably provided to hold the armature off, there was such a thing as residual magnetism, and that might hold it up." (The italics are ours.) This is a criticism made after eight or nine years' use. The answer to this criticism is short. had referred to the power of the accumulator on the engine to lift the heavy armature. It was a 4-volt accumulator, and it would be seen from Plate 1 that the armature was, at any rate, robust enough to do its work." And, after all, the armature is replaced by hand.

Much more of the same character might be brought forward to show in what way so important a privilege as that given by the Institution of Mechanical Engineers for the discussion of a "live" subject has been misused, but enough is as good as more. Will any other institution provide a similar opportunity where the essentials may be

thrashed out?

THE lead market has had a more sub-Lead. dued appearance during the last week or so owing to a certain extent to the lessened activity of buying on behalf of Russia, but also in some degree to a more accommodating attitude on the part of the larger producers in the United States. There is not the smallest doubt that the publication of the official returns of United States output took the market across the Atlantic completely by surprise, showing as they did an increase of about 100,000 tons in 1914 compared with 1913. Nothing like this had been expected by even the most bearishly-inclined people, and the issuing of the figures gave an almost immediate stimulus to the selling movement. Prices have not really weakened very much, but the tone has suffered to a minor extent. The future depends to an unusual degree upon the attitude to be taken up and maintained by the Americans.

If production in the United States is to be kept up to anything like the recent level, then certainly for a pretty long time to come the trade can do without the Mexican supply, the cutting off of which owing to revolution upon revolution has from time to time given rise to the greatest Under all the conditions ruling now it is at least probable that we shall continue to receive a fairly liberal quantum of lead from the United States, while according to the indications we should be receiving more and more metal from Australia as the months roll by. Things at Broken Hill should tend to settle down by degrees, and the necessity of keeping labour employed cannot be overlooked. As it is, we can do without any lead from Mexico for the present, any deficiency being made up fully from other quarters.

An encouraging feature is the way in which demands have been kept up in spite of the war. A good deal of metal is naturally demanded for war purposes, but apart from this there is a steady demand from all branches of the consuming trades, and this shows no sign of relaxing. Indeed, the makers of oxide and carbonate have of late been talking in quite encouraging fashion of the rate at which they were meeting with inquiries, and these look like going on.

The activity in the shipbuilding yards is a highly important consideration in this respect, and the possibilities are worth considering. The consensus of opinion regarding the outlook is that there will not be any great alteration in current prices. These are quite high enough at present to encourage producers to keep a full working staff busy, while, on the other hand, lead, compared with some other

of the commercial metals, appears to stand at a comparatively attractive level.

The following statistics are interesting at this juncture, showing as they do the imports of lead into the United Kingdom over a series of years:—

Preferential Terms. MR. H. FARADAY PROCTOR'S statement regarding the use of arc lamps for photo-printing, published in our last issue,

and Mr. Frank Broadbent's comment thereon in our "Correspondence" columns to-day, both touch upon a very interesting question, but both are open to criticism. In the first place, Mr. Proctor deals with the legality of charging for this class of lighting as if it were power. But we submit that the question of legality does not come in at all. So long as the same terms are offered to all consumers of the same class, no illegal preference is given. Even if electricity for photo-printing were sold at lighting rates, it would not follow in the least that luminous radiators would have to be classed as lighting also.

Again, Mr. Broadbent considers it to be generally understood that "electricity used for trade purposes," and not for illumination, should get preferential treatment. But no consumer, of whatever class, should get preferential treatment. Special rates may properly be given for specified classes of

use —but not preferential rates.

Mr. Proctor says that the ultimate purpose for which energy is used must be taken into consideration; Mr. Broadbent traverses this statement, and in his last paragraph gets very near to the true root of the matter—namely, the fact that the whole thing depends upon whether the demand occurs during the "peak-load" period or not. Nothing else matters.

Whether the electrical energy is used for lighting, heating, motive power, photo-printing, charging batteries, or driving motor-generators is absolutely no concern of the supply engineer's; all that he need consider is whether the demand under consideration necessitates, or is likely to necessitate, an addition to his capital costs by increasing the maximum load upon his plant, and he should regulate his charges accordingly. Granted that it is impossible in practice to carry out this principle absolutely—just as it is impossible to achieve perfection in any pursuit whatever—the aim of the supply engineer is to approach the ideal as closely as is commercially and practically feasible.

Some day the peak will become of relatively little importance—progress is constantly tending in that direction, with the increased efficiency of lighting appliances and the multiplication of off-peak demands; and when that day comes an all-round flat rate will be in order. May it be soon!

THE question whether Russia can Russia and dispense with the assistance of foreign German Firms. firms is engaging the attention of the leading newspapers in Petrograd, with special reference to German optical glasses, aniline dyes, and electrical engineering work. According to a communication obviously made by a German to a Frankfort newspaper, electrical engineering was introduced into Russia by Teutonic firms, although the part played by Belgium and one United States company is naturally overlooked. But when the correspondent asserts that the Russian authorities have closed the electricity supply works in Petrograd, Moscow and Warsaw, and that these cities are almost enshrouded in darkness, he is certainly taxing the credulity of his readers, especially Swiss Ambassador had no such complaint to make when having an interview, almost simultaneously with the date of the communication, with the Russian Minister for Foreign Affairs in connection with the extensive Swiss holding of capital in the Russian Electric Lighting Co. of 1886, which owns the leading supply works in the three cities concerned. Not only so, but the general interests of the three towns would be opposed to the closing of the stations, which are merely to be, or have been, placed under compulsory administration, as in the case of the German electrical manufacturing works, unless the documents to be produced by the Swiss Minister prove conclusively that the majority control of the capital in question is now held by Swiss financiers and French capitalists, the latter of whom are said to have acquired their interests from German holders some time ago. The correspondent of the Frankfort newspaper proceeds to quote a Petrograd professor as having declared that the electrical manufactures now procured from Sweden by Russia are not of Swedish origin, but of German construction, and that their purchase consequently only serves to enrich the enemy which has hitherto exported to Russia electrical manufactures of the value of £2,000,000 per annum, and has received from Russia a further sum of £3,000,000 per annum as the earnings of supply works in Russia. The first-mentioned amount may be correct, but the latter appears to be an exaggeration, unless it also includes the income derived likewise by Belgian and French interests, and the earnings of the Teutonic manufacturing companies in Russia. At any rate, the fact that the Russians are discussing the situation so as to become, if possible, independent of Germany in the future, affords confirmation of our recent remarks on the subject, and it should assist in the development of business relations between Russia and her

Syndication Methods in Germany. A RECENTLY issued report by Sír Francis Oppenheimer, H.M. Commercial Attaché in Germany, contains a store of information relative to the organisaton

and methods adopted by German manufacturers in their quest for world trade. A study of this report, to which we shall refer more fully in a later issue, will indicate which of these methods might be emulated generally and, in particular,

turned to advantage in our own electrical trade.

A striking picture is drawn of the height to which concentration of interests has attained. Not merely do we find a combination of manufacturers of certain finished articles gathering into the fold all the concerns who supply them with their partly-finished or raw products, but we also find producers of raw materials acquiring the factories which It is admitted that the control of production utilise them. and sales by this syndication method has prospered more in connection with unfinished products than in connection with finished products. Sir Francis Oppenheimer suggests that such elaborate concentration as obtains in Germany could not succeed save under a system of tariff protection Surely, however, a sufficient for the home market. measure of success has attended various combines—e.g., salt, soap and chemicals - to warrant our engineering trades in trying more co-operative methods. In Germany syndication has made the home trade predominantly lucrative; it is true that the resultant over-production has forced the finding of export outlets even at poorly remunerative prices; but the fact remains that a big export trade has been secured. Without syndication it is doubtful whether preferential export rates could have been obtained from railways and shipping companies, and whether support for commerce could have been enlisted so freely from diplomatic and financial circles. Sir F. Oppenheimer mentions that a big Rhenish-Westphalian combination came to the assistance of the actual banks to which it had originally owed its own Such intimate relationship between phenomenal rise. manufacturers and financiers seems very far from fruition in this country.

Granted that there are various lines of electrical manufacture which can be profitably extended here now that Germany is otherwise occupied, little advantage will be gained by individual British concerns spending money on investigation, perhaps laying down fresh plant, and then engaging in as much price-cutting amongst themselves as used to take place between the nations. But if a joint investigation could be carried out, existing selling organisations utilised co-operatively, and the resulting orders allotted, according to their nature, to those manufacturers best laid out for executing them, then the venture would stand an excellent chance of developing profitably and permanently.

LABOUR PROBLEMS: PAST, PRESENT AND FUTURE.

As we have already stated in some of our comments on industrial questions as affected by the state of war, what we are accustomed to describe as Labour Problems are being considered in an entirely different atmosphere—indeed, some of them are problems no longer, they have automatically solved themselves under the stress of circumstances, and in presence of a noble spirit of patriotism. In all likelihood some of the old controversies and differences which, but a short time ago, loomed so largely in the industrial outlook, and seemed to employer and to social reformer alike matters of prime concern, will not be reproduced, at any rate in the near future and under similar conditions. Politicians all would be well advised to adopt the advice given to the Liberal Party by Lord Rosebery in a famous Chesterfield speech, and start again as far as practicable with a "clean slate." We are far from suggesting that all the old grievances are going to be swept away by this terrible war, but we do suggest that they may be relegated to a position of minor importance in presence of the subjects of far greater national consequence which must inevitably occupy all of our minds for many years to come, and that they will come nearer to a common-interest basis of settlement in presence of the more sympathetic and united spirit which is fairly

generally prevalent in these days. While it is perfectly true, however, that some matters are in a state of suspense, and will remain so, it must also be recognised that the war has itself, by its simultaneous demands upon Labour, calling men to arms, and upon industry, clamouring for material of all kinds from thousands of factories, brought certain problems of the familiar class very urgently before our minds, and has created a number of new ones of an engrossing character. The best illustration of this is to be found in the most interesting report which was recently issued by the Departmental Committee which, at the instigation of the Local Government Board, investigated the new and unprecedented question of what employment could be found for the Belgian refugees who had sought shelter in these islands. All the civilised world was placed under an everlasting debt of gratitude to our Belgian Allies for their heroic defence of their country in presence of overwhelming and barbarous forces. All that has been done, and all the gifts that have poured in, could not adequately meet the necessities of their terrible condition. To find money, food and shelter has occasioned much difficulty, calling for scheming and contriving, but all of this has been done in a large-hearted way, and, we believe, to the best of our ability, without infringing any of our formerly accepted internal policies. It is when we get down to the problem of giving employment to our distressed Allies that we are perhaps likely to encounter the greater difficulty, for the permanent interests of the workers of the United Kingdom must not be adversely affected by the measures taken to cope with a particular and temporary emergency. The State has called workers to the Colours, employers have made either them or their families generous allowances, other employes are required to take their places. Under what conditions and at what wage shall Belgian refugees be permitted to take these situations? Everybody will agree that it is a thing not to be thought of that workers now with the forces shall find when they return to resume their avocations that wages have been reduced or the conditions worsened, or that their places at the bench and so forth have been filled by others not of British nationality. With this necessity for affording Protection to British Labour prominently in view the Departmental Committee has considered the whole question of Belgian employment. Happily at the present time there is such a feverish activity at the majority of the factories that there should be little difficulty in absorbing all suitable classes of Belgian Labour available at the same rates of pay as British workers are receiving. It may happen at a later stage, when we lay ourselves out to deal with the requirements of specialised industries established to supersede German imports, that other considerations on this skilled labour question will have to enter into our deliberations, but now we have

to deal with immediate needs and with immediately available Allied labour. We believe that wherever Belgians have been at work in English factories latterly, the same spirit of sympathy and co-operation observed in Flanders has been present—each Englishman recognises that he owes to some extent the present security of his own family and home to the kith and kin of those beside whom he works. Under such circumstances the British workman shows that at heart he is not such a bad fellow, and no one desires that old industrial disputes shall be reopened, if they can be avoided, because of the conditions consequent upon the present emergency.

As the President of the Local Government Board has appointed a Commission to put into execution the recommendations of the Departmental Committee, some reference to those recommendations is called for. It goes without saying that no fit and unmarried Belgian between the ages of 18 and 30 should be given employment, their Government having expressed the desire that they should render military service. The Committee lays down two main principles:—

(1) That no Belgian labour should be employed until every reasonable effort had been made to find British labour through the agency of the Labour Exchanges.

(2) That no Belgian should be employed at rates of wages lower, or on conditions less favourable, than those

generally observed in the district.

The refugees have been c'assified in three main groups as to their occupations, the first comprising workers qualified to fill vacancies in industries in which a shortage of British labour exists, such as armament workers, glassblowers, miners, motor mechanics, &c. It is believed that the majority of those in this group have already found employment, or will find little difficulty in so doing. For professional men, clerks, musicians, lawyers, &c., there are no openings, though for tillers of the soil and other workers in agriculture opportunities will be numerous in the coming months. In the case of qualified workers for whom there is no employment offering, it is proposed that they shall make clothes, furniture, and household goods to take back to Belgium when the invader has effectively been driven out and the land is at rest again. The Committee expresses the fear that in some instances refugees have been employed on unsatisfactory terms and conditions, which circumstance is not calculated to engender good relations with Trade Unions which have subscribed towards the Belgian relief measures. It is proposed that in all Government contracts it shall be made a condition that Belgian labour shall only be employed through the Labour Exchanges, and that a like principle shall be followed both by the railways and mining authorities of 'the United Kingdom.

Further, Government Inspectors are to impress upon employers the fact that the employment of Belgian refugees at rates of wages and under conditions other than those prevailing for British labour, is contrary to the Committee's regulations.

We believe that the Committee has handled a matter of great difficulty with considerable ability, showing full sympathy for our distressed Allies, and appropriate foresight in regard to British interests.

From various sources we learn of the shortage of general labour. The congestion at the docks in London is in part due to this circumstance, but early relief is very necessary, and it is a pity that we cannot commandeer the services of the loafer, carrying into practice the healthy principle that if a man will not labour, neither shall he eat—or drink. It is also deplorable that the Port of London Authority should have such poor facilities for transferring labour from point to point as it becomes available.

In the matter of skilled labour, however, the difficulty is far greater, and the necessities of the situation in engineering works engaged upon Government orders have, according to an article by the *Times* Sheffield correspondent, led the Ama'gamated Society of Engineers, "perhaps the most exclusive among Trade Unions," to "relax its guard and permit untrained, or partially untrained, labour to be employed upon semi-skilled work." The writer states that "of 17,500 Trade Unionists engaged in the construction of steam engines, there are at present only 10 drawing out-of-work pay." We read in another contemporary that

an official report shows that employment could be found for over 15,000 workers of various grades in the engineering industry of the country. It is most gratifying to read of the co-operative spirit that prevails between the A.S.E. and the Federation of Engineering Trades Employers in face of our common danger, and if in more peaceful times they can only be brought to regard labour disaffection as an enemy common to both sides, which should be tackled in a reasonable spirit, the hopes for the future of engineering industry and employment may be allowed to run high. Conferences have been held between the A.S.E. and the Employers' Federation, under which the agreement between them relating to unskilled labour shall be waived, in order to assist in the speedy execution of Government contracts for war material. The men have stipulated that several conditions shall attach to the use of unskilled labour for semi-skilled work, and they demand that wages proportionate to the work shall be paid, and that the arrangement shall end when the pressure ceases, their intention being to adopt every means in their power to preserve the province of the skilled man. We believe that the reasonableness of these stipulations will be conceded by the employers, and though perhaps the spirit of the old Trade Union Adam seems to show itself just a little bit, this is no more than is to be expected. Nobody will desire labour, especially skilled labour, which is rendering such magnificent service to the country at this time of crisis, to be placed at a disadvantage after the war. But if there is partly skilled labour available, it would appear ridiculous for requirements to be delayed because Unionists, in the interests of their confreres, imposed antinational restrictions.

We cannot but deplore the trouble that has broken out among the miners of West Yorkshire at a time when their number is seriously depleted by the war, and when the textile factories are utilising fuel and power practically continuously. The peacemakers are at work, and we wish them speedy success. Without attempting to enter into the details of this latest development of minimum-wage controversy, we hope that both sides will fully recognise that the times are not normal, and that national needs demand concessions or compromise, so that peace at home may remain unbroken, allowing everybody to continue to help the Allies in their struggle with the enemy.

The whole question of labour will probably take on an altogether new aspect after the war is finished. In some respects the position of Labour may be strengthened, but we believe also that lessons have been learned by the rank-and-file. We do not want "cheap" labour in England, but somehow the cost of production has got to be lessened in respect of many manufactures by the time when German competition resumes. In absence of information as to when that may be; not knowing how many more men may yet have to be called away from their accustomed occupations; with some uncertainty as to the outlook for industry and trade, and with an almost certain depletion of the resources of skilled labour now in uniform, one can only hint at the prospect of the approach of new problems of labour in place of the old.

RUSSIAN ELECTRICAL AFFAIRS: GERMAN INFLUENCE IN THE PAST.

WE learn from a Petrograd paper that at a recent meeting of electrical engineers held in the Electrotechnical Institute of Alexander III, a discussion took place in the course of which M. Dmitrieff spoke at length on the foreign element in Russia's electrical industries. He said that Russia had a total of 137 central stations. Of these 80 belonged to municipalities and served 5,000,000 citizens, and 57 were concessions and served 9,488,000 citizens; that was to say, that although the concession stations were so many less than the municipal stations they served twice the number of The concessionaires had become the rulers of the citizens. most industrial and most densely-populated districts. The district stations in Russia controlled great industrial areas. For example, the 1886 Electrical Co., with its station at Moscow, controlled the Bogorod industrial region; with its

Petrograd station it controlled the Petrograd district, and with the Lodz station the town of Lodz. The speaker pointed out the industrial, economic, and even political dangers of such control, and advocated co-operation as the proper basis for such enterprises, particularly on behalf of the groups of small capitalists who cannot afford to install

M. A. A. Kuznetz off, referring to the importation of electrical materials from abroad, said that for some weeks after the outbreak of the war there was a great shortage of small electrical goods, whilst large goods could not be had at all. Stations the construction of which had been begun remained without machines. Only a few parts were to be had; the remainder were to be found somewhere, say Nurnberg, &c. All had become dearer in price. It had become necessary to apply to England and Sweden for what must be had. It appeared that Sweden, taking advantage of the products of German industry, had established, after two months of the war, a large electrotechnical industry. On a detailed and a careful examination of the goods imported from Sweden, judged by their type and construction, they are all from Germany, only without German marks. Thus, complained the speaker, "we are supporting Germany with our money." Two-thirds or three-quarters of the total importations must be ascribed to Germany.

All imported goods may be divided into three groups:—
(1) Goods the importation of which fluctuates for various reasons, e.g., wire. (2) Goods that have to stand a fair protective duty, or that are protected by the telegraphs or telephones; the importation of such goods into Russia is small. (3) Goods the importation of which into Russia is

continuously growing, e.g., electric lamps.

In the main, the production of electrical goods has been concentrated in large specialised factories. These are the following: The Russian General Electrical Co., original capital 12,000,000 roubles; the Russian Electrical Factories Co., Siemens & Halske, 5,600,000 roubles; Russian-Siemens-Schuckert, 15,000,000 roubles; the United Cable Factories, 6,000,000 roubles; the Siemens Polish Factories, 1,000,000 roubles; the Volta Co., 1,050,000 roubles.

Respecting the Tudor and the Dynamo Companies, reliable particulars of their original capital are not available. The Russian A.E.G. is no more than a branch of the corresponding house in Berlin. The chief office is in Petrograd, and the factories are in Riga. There are branches all over Russia; but they are governed by orders from Berlin. The chief shareholders in this company are Germans as can be seen from the minutes of the general meeting of shareholders held on May 7th-20th, 1914. This showed that the largest were the Allgemeine Electricitäts Gesellschaft, the Bank für Handel und Industrie, and representatives of various other Berlin banking houses.

The speaker proceeded to show by specific references that Siemens & Halske and the Siemens Schuckert Companies likewise derived all their financial and controlling strength from Germany. After these detailed references to the principal Russian electrical concerns, he went on to say that the measures to be taken in the struggle with the Germans were as follows:—(1) To cease giving concessions to foreigners in Russia; (2) orders by the Government and public associations should be executed in Russia by Russian workmen and with Russian material—it is well known that in Russia the machines are only assembled; (3) the imposition of sufficiently high Customs dues; (4) the granting of credit by the Russian Imperial Bank to electrical concerns; (5) restriction of patent rights held by German subjects in Russia. The speaker concluded with these words:—"Our electrical power is abundant. We have served German capital long enough. We must now serve ourselves."

M. P. M. Avaieff having spoken in a similar way, observed that the following electrochemical and metallurgical products were made in Russia in 1913. Electrolytic copper, 1,300,000 poods, value 18,200,000 roubles; electrosteel, 250,000 poods, value 625,000 roubles; aluminium, 80,000 poods, value 1,600,000 roubles; chlorate of potash, 150,000 poods, value 1,200,000 roubles; nitric acid, 3,500,000 poods, value 6,000,000 roubles; calcium carbide, 90,000 poods, value 400,000 roubles; electric accumulators, 210,000 poods, value 1,700,000 roubles. The capital

invested in the electrochemical industry yields up to 100 per cent. net profit. Unfortunately, it is nearly all foreign—German.

From the discussion that followed, it would seem that the capital in Russia in the savings banks, and what is used in the organisation of small credits, is practically all under the control of banks that receive their orders from Germany. Hitherto it has been impossible for an independent electrical industry to grow up in Russia, for the Germans used large capital in order to snuff out any such efforts!

ELECTRIC LIGHTING AUTHORITIES AND THE LAW OF RATING.

[FROM OUR LEGAL CONTRIBUTOR.]

Most of our readers will have received ere now a copy of a species of summons requiring such of them as be ratepayers to supply certain particulars to the overseers of the poor. This is a document which is served upon metropolitan ratepayers once in every five years, and it is one which should receive very careful attention.

To ascertain the rateable value of an ordinary dwelling-house is a comparatively simple matter. The overseers in one of the metropolitan boroughs make the following

statement:-

"It may be mentioned for your information that the Council's Valuation Committee are required, in making the New Valuation List, to fix the gross value of all properties in the borough at an amount corresponding to the annual rent which the tenant might reasonably be expected, taking one year with another, to pay for the premises, if the same were let on an annual tenancy, and the landlord undertook to

bear the cost of repairs."

When, however, we come to consider a highly complicated piece of property like an electric lighting undertaking, the ascertainment of the hypothetical rent is by no means a simple matter. Those who pay rates may be prejudiced either (1) by a rise in rates, or (2) by a rise in rateable value. As the corporate body has no say in the election of guardians who control the rates, its one means of protecting itself against anything in the nature of extortion is to prevent an exaggerated valuation. In these circumstances, it may be found useful if we discuss some of the principles upon which the property of electric lighting companies is rated, with a view to enabling interested persons to ascertain whether, in the light of events during the last five years, their valuation is likely to go up or down.

The law of rating is by no means simple. This is partly due to the fact that Parliament does not define rateable value, and has never attempted to do so. All the Legislature has ever done is to prescribe the means by which rateable value may be estimated. Seeing that the last Act dealing with the subject was passed so long ago as 1862, it is not surprising that it contains no reference to electricity or

electric lighting undertakings.

We must, indeed, go back to first principles in order to ascertain the law of rating. The Parochial Assessments Act, 1836, provides that a rate must be "made upon an estimate of the net annual value of the several hereditaments rated thereunto; that is to say, of the rent at which the same might reasonably be expected to let from year to year, free of all usual tenants' rates and taxes . . . if any, and deducting therefrom the probable average annual cost of the repairs, insurance and other expenses, if any, necessary to maintain them in a state to command such rent."

As such a person as an actual "tenant" of an electric lighting undertaking is a creature unknown, it has long been the practice, in rating gas companies and similar undertakings, to have regard to the profits which such a concern would bring in. Three leading principles of law are as follows:—

(a) In valuing the works, pipes, &c., of an electric lighting company for the purposes of rating, the profits earned by the company are taken into account.

(b) The exercise of the right to lay down wires and send electricity through them, amounts to an occupation in law, so as to be rateable.

(c) If the electric lighting works belong to a municipal corporation or other local authority, that body is rateable, although the profits earned are devoted to public purposes.

Let us now examine the method by which the rating authorities endeavour to ascertain the hypothetical rent.

The first step is to ascertain the net receipts. is done by taking the receipts of the company from every source, and subtracting therefrom the ordinary working expenses (other than the cost of repairs, insurance, &c., which come in later on). Having ascertained the net receipts, it is necessary to inquire how much of them a tenant will be willing to pay as rent to a hypothetical landlord. He would not, of course, pay the whole receipts as rent, as he would not then have any incentive to embark on the undertaking. There must be a deduction for on the undertaking. "tenant's profit," sometimes called "tenant's share." It is worked out as a percentage on the tenant's capital. tenant's capital is the value of his loose stock-in-trade, and a sufficient capital sum to enable him to provide for working expenses. It would not, of course, include the value of the boilers, engines, dynamos or other fixed machinery at the central station, but it would include the meters on consumers' premises, and all the loose tools, &c. A percentage is then taken on the tenant's capital, and considerable difficulty is often experienced in deciding what this should be. At the London Quarter Sessions the usual practice in rating the property of a gas company is to take 5 per cent. for interest, 10 per cent. for trade profits, and $2\frac{1}{2}$ per cent. for risks and casualties, making $17\frac{1}{2}$ per cent. in all.

Having deducted the tenant's profit, we arrive at the

Having deducted the tenant's profit, we arrive at the gross value of the undertaking. According to the rule laid down in the Statute (supra), the cost of repairs, renewals and insurance sufficient to maintain the hereditament in a state to command the rent must be deducted from this, inasmuch as these charges fall on the hypothetical landlord. Making a final reduction of the rates, which the tenant has to pay, we arrive at the rateable value of the whole

undertaking.

The above principles of rating can be best understood by looking at the following figures, which were given by Mr. Harold Eve in the course of the case of Charing Cross Electricity Supply Co., Ltd., v. Lambeth and Westminster Assessment Committee in 1906:—

ASCERTAINMENT OF RATEABLE VALUE.

			•	•••	£125,194
Working expenses	•••	••	••	•••	50,281
Net receipts				•••	£74,913
Tenants' share, 171	per cent	on £	51,000	•••	8,925
Gross value, plus rat	es .			•••	£65,988
Repairs and renewal			•	•••	27,341
Rateable value, plus	rates		•	•••	£88,647
Rates, at 7s. in the	€ .		•	•••	10,020
Rateable value of w	hole un	dertaki	ng	•••	£28,627

In London, as the rates are only revised once in five years, it is necessary to consider what year is to be looked at for

the purposes of rating.

In Charing Cross, City and West End Electricity Supply Co., Ltd., v. City of London Union (1906, Konstam 31), the company appealed against a valuation made in 1905. The question arose as to what year was to be considered. The company published their accounts yearly—not half-yearly. It was held that the case must proceed on the basis of the company's accounts for the year 1904, but counsel for the Union were to be allowed to put questions as to the general working of the company in 1905. The Deputy-Chairman of the Quarter Sessions said:—"Sir E. Boyle (counsel for the Union) must refer only to the general results of 1905, and not to the precise figures. An electric supply undertaking is not like an ordinary business; some other light may spring up immediately and take the place of electric light."

Hitherto we have proceeded upon the assumption that the entire undertaking of the company is situated in one parish or rating area. In such a case there is no necessity to consider whether the profits, upon which the rateable value is founded, are earned at the generating station or at the premises of the various consumers. But where, as nearly always happens, the undertaking is distributed over many

parishes, difficult questions arise. For instance, the generating station, which is only indirectly productive, may be in one parish, while the directly productive part of the works may be distributed over the company's whole area. How are the profits to be apportioned? The difficulty is got over by considering the claims of all the different rating areas together.

In dealing with this question, rating authorities have recognised the fact that the undertaking of a gas or a water company is very similar to that of an electric lighting company. The principle adopted in the case of a water company was laid down in 1847 in the case of R. v. Overseers of Mile End Old Town, 1847, 10 Q.B., 208. There the works of a water company extended into several parishes. The rateable value for the purposes of poor rate, of the entire works, was £30,800. The rateable value of the reservoirs, buildings, &c., valued as land and buildings deriving value from their capacity of being applied to the objects of a water company, was £6,500. It was to the objects of a water company, was £6,500. It was held that the rateable value ought to be apportioned among the several parishes in the following manner:-"The rateable value of the reservoirs, buildings, &c., valued as above, to be first deducted from the total rateable value, and distributed among the parishes in which this portion of the works was situate, according to the extent of such works in each parish; and the residue of the rateable value to be apportioned among the parishes containing the service pipes, in the ratio of the net profits produced in each of those parishes." (To be concluded.)

THE N.S.W. GOVERNMENT POWER STATION.

A recent issue of the Commonwealth Engineer contained a description of the new White Bay traction power station of the N.S.W. Government Railways and Tramways Department at Balmain. The first section of this station is nearly complete and three 7,500 kW. turbine units will shortly be available to supplier the transport of the second section.

plete and three 7,500 kW. turbine units will shortly be available to supplement the tramway service.

The station is close to White and Rozelle Bays, giving an almost unlimited supply of circulating water; it is convenient to overseas wharfage and to railway and tramway connections. The complete block of buildings to be erected will be 465 ft. long by 242 ft. wide, and will accommodate ten turbo-alternators, eight for normal use, one under repair, and one standby. At present only half the station has been erected, to

The boiler house—which will be divided into sections when complete—contains three floors, i.e., ash basement, firing floor, economiser and fan floor, and coal bunkers are provided over each firing aisle giving approximately 1,000 tons of coal per unit, or about eight days' supply. Fuel is brought in on two elevated railway tracks, equipped with electric capstans, and the trucks, after emptying into hoppers, run down a decline and up a short incline where they strike spring buffers, causing a rebound which is sufficient to send them over automatic routes on to an empty truck siding.

points on to an empty truck siding.

A fuel hopper, bucket elevator and belt conveyor (50 tons per hour) is provided to each unit; a Denison coal weigher A fuel hopper, bucket elevator and belt conveyor (50 tons per hour) is provided to each unit; a Denison coal weigher is provided to each boiler, and the ashes from the latter are collected and discharged into a 40-ton tank over the railway, by means of a pneumatic suction ash plant. The boilers, each of 27,000 lb. evaporation, normal rating, and 40,000 lb. under forced rating, supply steam at 180 lb. pressure, 200° F. superheat. Inclined chain-grate stokers, specially designed for burning coals which are low in volatile hydrocarbons, are fitted. A 288-tube Green economiser is provided to each boiler and one Prat ejector type chimney to each pair of boilers. The boiler, coal, ash and draught plants were all supplied by Messrs. Babcock & Wilcox, Ltd.

A narrow bay between the boiler house and engine room forms the pump room, containing a 360-gallon per minute service feed pump for each unit, of the Mather & Platt six-stage centrifugal type; an emergency steam-turbine driven two-stage pump by Messrs. Mather & Platt is also provided, together with Venturi meters in the pump deliveries and Precision meters in the air-pump discharges to the-hot wells.

Three Willans-Dick Kerr 7,500 kw. turbo-alternators have been ordered for the plant, one, however, owing to the conditions at the time, being installed in the Ultimo power house; a fourth 7,500 kw. turbine set was obtained from the General Electric Co., U.S.A., owing to unsettled labour conditions in Great Britain.

The Willans turbines are of the disc and drum type with a guaranteed steam consumption of 13.9 lb. per kw. hour, full load, vacuum 28.3 in. The speed is 750 r.p.m. The American turbine is a six-stage horizontal Curtis plant, running at 1,500 r.p.m.

1,500 r.p.m.

The generators supply three-phase current at 6,600 volts, 25 cycles; the Dick Kerr machines are ventilated by independent 30-H.P. fans, and the American machine has ventilating fans attached to the rotor; a 125-volt exciter is coupled to each

alternator.

Messrs. Willans supplied their own surface condensing plants, while Messrs. W. H. Allen & Son supplied the plant for the American turbine. The circulating water is drawn from White Bay and discharged into Rozelle Bay; two concrete ducts, side by side, connect the two bays passing under the turbine house from end to end. Settling chambers and revolving screens are provided in the ducts, and valves at the power house allow the direction of the flow in the ducts to be reversed and the hot discharge to kill any marine growths.

The condensers are mounted over the circulating water ducts, and owing to the syphon action between the inflowing

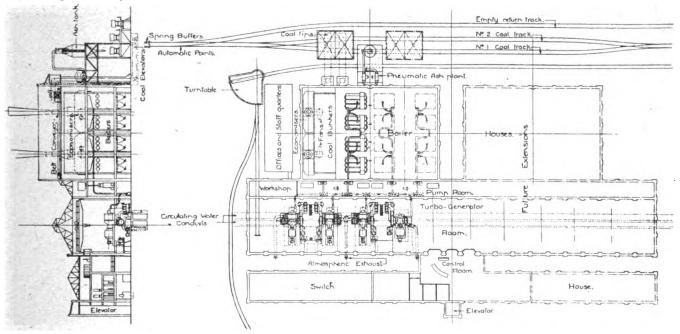

FIG. 1.—GENERAL ARRANGEMENT, WHITE BAY POWER STATION, BALMAIN, N.S.W.

accommodate four 7,500 kw. turbine units each supplied with steam from four water-tube boilers.

The four batteries of boilers comprising the first installation are arranged on either side of two firing aisles at right angles to the engine room in which the turbine units are placed cross-wise, in pairs, with the auxiliary plant between them. Each turbine, with its boilers, condenser, auxiliary plant and switchgear, forms a complete power unit independent of the others. others.

and outflowing ducts below, the circulating pump—having once started the water flow—has merely to operate against the difference in level between the two ducts. Except for the 600-volt D.C. motors for the 50-ton engine room crane, the whole of the auxiliary motors are of the three-phase 440-volt type, mostly open squirrel cage machines, although totally enclosed and pipe ventilated motors are used in exposed situations. The H.T. switchgear, supplied by the G.E. Co. (U.S.A.), is situated in a switch house adjoining the engine room.

The main oil switches are all of the motor operated type, while the auxiliary circuits, supplied through six 350 kw. Brush transformers are controlled by solenoid operated switches. Current limiting reactances are provided in the generator circuits, designed to give a 6 per cent. drop at normal load, but

In conjunction with the transformers an oil circulating system is in use by means of which the oil can be passed through a filter and dryer to a reservoir, from which it flows back by gravity to the required transformer.

The switchgear is operated by remote control, a bench

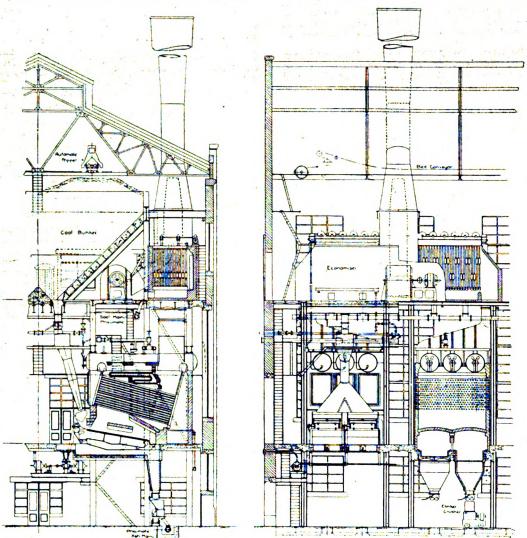

Fig. 2.--SECTIONAL VIEWS THROUGH BOILER HOUSE.

capable of carrying 150 per cent. lead continuously with a larger drop.

Aluminium lightning arresters have been installed on each outgoing feeder with a view to surge protection from this end.

board—for the generators—and feeder control board being located centrally on the switch house side of the engine room; eight sub-station feeders are allotted to each generator. A complete electric signalling system with illuminated dials is

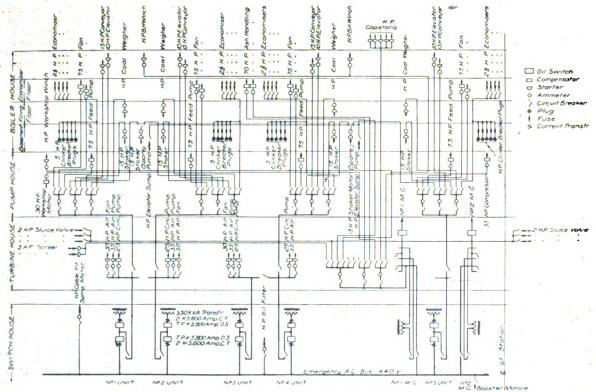

FIG. 3.—DIAGRAM OF AUXILIARY MOTOR CIRCUITS FOR HALF STATION.

provided between the control room and operating staff, while

telephones, electric clocks, etc., are also installed.
The alternator leads run through fibre ducts underground to the switch house basement, to reactance coils giving a 6 per cent. reactance drop at normal load; the leads then pass through glazed brick chases to the oil switches. A ring 'bus system has been adopted; the H.T. leads are all carried in separate chases and conduits, the chases being continued on the ceilings. the ceilings.

A complete workshop and general store, offices and staff quarters, equipped with shower and plunge baths, are also features, while a reserve coal storage yard with crushing and loading facilities is provided at Leichhardt to safeguard the operation of the plant, from all of which it will be gathered that the Railways Department has provided for a modern installation

installation

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUBBDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

A.C. v. D.C. for Lighting.

Referring to the letter in your issue of the 8th inst., signed "X-Gas," under the above heading, your correspondent can set his mind at rest as regards the suitability of low periodicity alternating current for lighting. Current at 40 cycles is used in a great part of Cardiff, and as a matter of fact this letter is being written by its aid. Quite a number of small towns and villages in South Wales are lit by current at 25 cycles, supplied by the South Wales Power Co., and my own house is so lit. Personally, I have not experienced the least inconvenience. venience

More than this, a very large number of the collieries and works are being supplied by the South Wales Power Co., and I know that where this current is used for the lighting of machine shops, it is found to be entirely satisfactory. Occasionally one comes across a metal-filament lamp with rather lose filaments, and these vibrate in synchronism to the periodicity, but even in such cases, where a Holophane or other shade of similar type is used, the vibration effect is entirely lost.

entirely lost.

Theodore Stretton.

Cardiff, January 12th, 1915.

Garage Heating.

With reference to "Interested Inquirer's" letter in your issue of January 8th re above, in my opinion your correspondent has been ill-advised to install a radiator of the redhot element type. While it is true that the normal temperature attained by these elements may not be sufficient to ignite an explosive mixture of petrol vapour and air, there is always present in a garage some dust in the form of particles of lint, say from brushing the upholstery down, or straw, etc., which will almost assuredly incandesce in contact with the red-hot elements, and be sufficient to ignite the mixture or petrol vapour.

elements, and be sumcient to ignite the mixture or petrol vapour.

I have seen a motor-cycle set on fire by a smoker drawing at his cigarette when the carburettor was flooding, the incandescence from the edges of the paper doing the trick.

The safest possible heater to use is the electric convector or air warmer. Several types are to be had of small dimensions, notably the circular tube type with perforated case, 500 or 1,000 watts.

A plug should not be fitted on the heater, or if one is fitted on a standard it should be fixed up so that it cannot be removed, as the flaming sometimes caused when putting the plug on might be fatal to spare petrol, not to speak of the car. If it is desired only to keep the water from freezing, one of the small immersion heaters dropped in the radiator tank through the filler can and suspended by a store of some kind

through the filler cap and suspended by a stop of some kind to prevent its total immersion over the terminals is a good plan. An electric flat-iron has been used for this purpose by placing it against the bottom face of the car radiator, but this is not fair to the flat iron.

Chas. H. Archer, Electric Heating Specialist.

King's Norton, January 11th, 1915.

Wireless in Warfare.

I have the honour to inform you that the following notice in your periodical of October 2nd, 1914, on page 470, has attracted my attention:—
"Wireless in Warfare.—It is suggested that the German cruiser Emden, which has been so successful in capturing British ships in the Bay of Bengal, has been receiving information regarding the movements of shipping from the Telefunken stations in the Dutch East Indies; these are, of course, on neutral territory, but are probably worked by German officials."

With respect to this notice I am obliged to give the following rectification:—The wireless stations in Netherlands East-India are owned by the Government and are operated by Netherlands officials only, who during the whole war time have got and strictly followed the most positive orders with regard to maintaining our neutrality. No German or any other stranger has been on the stations or is allowed even to enter the grounds, as the stations are under constant watch of the military department. Moreover, I am able to contradict most positively that the German cruiser Emden received any telegrams or any information from the operators regarding the movements of shipping.

I should esteem it a favour if you would be kind enough to publish as soon as possible a rectification in that way.

Batavia, December 4th, 1915.

G. R. C. Plop,

The Chief of General Direction of Posts, Telegraphs and Telephones in Netherlands, India.

[We are very pleased to publish this letter, and regret that

[We are very pleased to publish this letter, and regret that the Dutch stations were unjustly accused of a breach of neutrality.—EDS. ELEC. REV.]

Wonderful Accumulator Cells.

Wonderful Accumulator Cells.

It is not necessary for me to answer Mr. Faraday Hawdon's questions, because he answers them himself. I am sorry that he cannot "follow the inference suggested by the statement," "The positive plate is now of normal size"; perhaps others can. I am quite well aware of the behaviour of separators, made of unsuitable celluloid, in storage batteries, both large and small. Troubles too numerous to mention were experienced through these twenty years ago in large 61-plate cells. One large firm used asbestos cloth, and kaolin separators were used by Niblett & Sutherland, in their Umpire cell; they are still used for small cells to-day by two firms, differing only in design. Their disadvantages, under certain conditions, are quite obvious, especially when packed tightly between the plates, and very little room left for acid.

Corrugated and perforated ebonite separators are used in

plates, and very little room left for acid.

Corrugated and perforated ebonite separators are used in many first-class small batteries, and these give no trouble; for large batteries where an efficient separator is required, nothing beats the standard wood diaphragms, properly treated in order to free them from pyroligneous acid, and vasculose, and placed mid-way between the plates so as to allow free access of acid, and to permit free movement of the ions, escaped gas and perfect diffusion.

Newcastle-on-Tyne, January 16th, 1915.

Salaries of Junior Engineers.

Salaries of Junior Engineers.

A senior assistant of my acquaintance employed in a neighbouring sub-station of 3,000-kw. capacity has recently been "on the carpet" twice, owing to trouble caused by the incapability, negligence and lack of knowledge on the part of the junior assistant under him. The senior had long service with his employers and, previous to the trouble, a clean sheet. The junior, on joining the supply company, was quite "raw" in regard to central station work and plant, and, moreover, too young to undertake the responsible duties assigned to him. The senior has, in consequence of the trouble, been reduced in status and position. All the facts are known to the employers—they holding that, no matter what happens, the senior is to blame and the junior is in no way responsible for any mishap due to his actions. The company also add that, owing to the shortage of unskilled labour, they are obliged to take who they can get.

Ought the skilled men to suffer because the employers are experimenting with unskilled labour? If this is the general attitude of employers, I pity those having raw youths under their charge during the present crisis. Mr. Ebben's remarks are only too true. Employers can afford to be reasonable without being half as hard hit by present conditions as are the poor devils grinding out 56 hours a week, year in and year out, for a paltry 30s. or so.

Manchester, January 16th, 1915.

Manchester, January 16th, 1915.

J. Kav.

Our old friend, Mr. Ebben, has again cropped up and, judging from the tone of the paragraph last but one in his effusion published in your current issue, it would appear that he is rapidly qualifying as a "Hyde Park Orator," and I wonder that he wastes his time in the comparatively tame occupation of airing his and a few of his colleagues' grievances through the columns of your valuable journal. Of course it is admitted that in a few cases shift engineers and others are badly paid, but on the other hand it must be realised that the smarter of these men are qualifying for better positions. Those with brains and who like work will, undoubtedly, obtain promotion while the remainder cannot expect high wages for subordinate positions. Nowadays, central-station work, so far as it affects shift engineers, switchboard attendants and others, is largely a matter of "Rule of thumb" methods and really very little skill is required, all processes, from stoking the boilers to regulating the pressure, being caried out by automatic apparatus, and the real work devolves upon the station superintendent and his assistants who are responsible for the efficient work-

Digitized by Google

ing of this automatic apparatus. In my humble opinion the day of the "collar and cuff" shift engineer has gone, and I would infinitely prefer to have the services of a good, steady experienced engine driver in charge of his shift rather than those of a young inexperienced college man who, when trouble occurs, has necessarily to rely upon the above-mentioned driver to put him right. When things are going well our young college-trained gentleman usually spends his time in playing cards with his switchboard colleague or in some other amusement, while the driver does the work.

If Mr. Ebben himself is a shift engineer he will probably know that my judgment is correct, but as he has always maintained that these gentlemen are overworked I doubt whether he occupies such a position, as if so he could scarcely find time to adopt the rôle of a "Trade Union Agitator" in addition to his multifarious duties. I should strongly advise him to form his Association into a recognised Trade Union when in addition to being able to air his views without restraint, he, as Organising Secretary, would have a very much better job than he is ever likely to get in a supply undertaking.

Preferential Terms for Arc Lights for Photo Printing.

Referring to your note on Mr. H. Faraday Proctor's letter on this subject on page 86 of the current issue, one is a little surprised to see a point of this kind raised, because it appears surprised to see a point of this kind raised, because it appears to be generally understood that electricity used for trade purposes, and not for illumination, should get preferential treatment. On several installations which come under my supervision electricity is supplied at special rates not only for the arc lights used for photo-printing, but also for the red and yellow lamps used in the dark rooms for delevoping. In both cases the lamps are used for trade purposes, and not for illumination; in fact, the rooms are artificially darkened to keep out daylight so that the processes may be carried on during daylight hours. For the same reason that this class of work is supplied at special rates, so also is battery charging when carried on during day time, although the stored energy is afterwards used solely for lighting purposes; a motor generator, however, would not be entitled to motor rates if used for lighting purposes.

Preferential terms are given not because the electricity is used for lighting, or power, or heating, but principally because it is used during the hours of daylight, when the demand for lighting is small

London E.C., January 15th, 1915.

Frank Broadbent.

Experienced.

I notice that the legal correspondent of the Municipal Journal, in the issue of January 15th, states that "he is unable to change his opinion," but by his own words he admits that my contention is right, viz.: That the ultimate purpose for which electrical energy is used is to be taken into consideration in determining whether such use is lighting, power or heating. In the issue referred to he says:—"But in law and in fact such undertakings do charge according to whether the energy is for lighting or power. A reference to the analytical tables in the 'Municipal Year Book' shows this beyond dispute." I may only add that it is equally beyond dispute that electrical energy used for photo printing is not "energy for lighting," or to employ the more correct term, "for illumination purposes."

H. Faraday Proctor, Hon. Sec., I.M.E.A.

Bristol, January 18th, 1915.

[We refer to this matter in our leading columns.—Eds. Elec. Rev.]

Advertising and Character.

Advertising and Character.

I do not agree with your correspondent, who states that "an advertisement does or should reflect the character of the firm issuing the announcement." Very artistic and clever advertisements have before now been employed to advertise comparatively worthless productions, and one need not go outside the confines of electricity to add "notorious swindles." On the other hand, I hold that advertisements should be designed to attract the character of the individual whose enquiries are solicited. This is a very different proposition, and calls for a recognition of the diversity factor in the human mind. None of the theories put forward up to now in this correspondence is wholly confirmed by my experience as an advertiser. While each of the suggestions put forward may be sound, they would, in my opinion, only be separately effective, and in a limited sense, and each would fail by repetition. Were I a professional advertiser, I should deem it necessary to appeal in turn to the diverse personalities we know to exist; in other words, to "ring the changes." One only needs to peruse your correspondence columns on this subject to realise the variety of taste there is to cater for. There is the man with æsthetic taste and the man without; there is the man who appreciates detail and the man who, having no time for who appreciates detail and the man who, having no time for it, turns the page over quickly. There is "Consultant," who objects to be reminded of a special brand of whisky during his comic intervals, and his antithesis who would welcome such a reminder under any circumstances. There is the man (Mr. E. I. Hill reminds us) who always reads his technical coursels during their read have the sight free. journals during business hours, and is not in the right frame

of mind to be amused, and there are the men, myself included, who never read those journals during office hours, and therefore welcome a little mental relaxation by way of humour

in the advertising and editorial columns.

Then there is the British reader in the Colonial market who plumps for British solidarity; the Canadian in the same market who finds British methods leave him with "cold feet," and who searches for the latest American "stunt"—and, finally, a large community who object to advertisement in any and every form. Obviously, it is impossible to attract avery

finally, a large community who object to advertisement in any and every form. Obviously it is impossible to attract everybody at once, so again I say, "ring the changes."

I have advertised in technical journals for many years and with varying success, and it may interest the votaries of publicity to know that the advertisement to which "Consultant" referred in his "critique" is the only one I have ever caused to be inserted which has brought letters of congratulation from all directions, many of them enclosing valuable and lengthy enquiries. Truly, its complete success was married by a regrettable oversight. Owing to my enforced absence from the office when giving written instructions, I completely overlooked the fact that our mailing list includes the names of a few people who probably do not read the ELECTRICAL REVIEW. Such people only received one-half of my message, and the Such people only received one-half of my message, and the other half revealing my identity, being in the advertising columns of the journal, I fully realise that it must have been columns of the journal, I fully realise that it must have been extremely annoying to the Electrical Review to be asked for a copy or to be bothered in any way in connection with a matter in which they had no concern whatever. Undoubtedly the postcards should have borne my company's address; it would have improved the value of the advertisement without duminishing its exceptional effectiveness. As I have remarked, that was an oversight for which, the circumstances being known, I hope I am forgiven. But here again is a strange anomaly. Some of the most complimentary replies were received from people who stated that they had quite a difficulty in obtaining a copy of the magazine, and this appears to have given them quite an added interest in the advertisement.

In conclusion, if any of your correspondents are sufficiently interested to care to see some of the original remarks the advertisement evoked, I shall be most happy to show them.

tisement evoked, I shall be most happy to show them.

Herbert Berry.

Hove, January 19th, 1915.

With further reference to the above and to Mr. E. J. Reed's remarks in your current issue to the effect that "Technical Advertisements have special consideration," I would like to add that I consider that to be a thorough advertising man a sound acquaintance with technical terms, and buyers' and users' requirements is essential in at least 90 per cent. of the trades which employ publicity. That this is so may be either known from sufficient regrently experience are and users' requirements is essential in at least 90 per cent. of the trades which employ publicity. That this is so may be either known from sufficient personal experience or clearly seen in many rubber, electrical, petrol, motor and general engineering journals where publicity work is turned over by manufacturers to general advertising agencies who place the copy and designs. The inevitable results are always very flat, sometimes pitiful. In the case of commodities which appeal to the crowd, the general "fluent" professional advertisement writer is good & and a sufficient and cure-all balms.

In stating that his reason for prefering British to Andrew the sufficient and cure-all balms.

and cure-all balms.

In stating that his reason for prefering British to American advertisements is the same as that which prompts him to prefer a gentleman to a costermonger, Mr. Reed leaves himself open to be caught in his own trap, as the average costermonger is far superior to the average gentleman in business instincts and aptitude. As an American by instinct I thank your correspondent for his somewhat subtle, though unintentional generalizement. tentional compliment.

Arthur Mallord Turner.

London, S.W., January 18th, 1915.

Jowers Protective Leakage Device.

Although I have not seen this device and can only go by the description recently given, it would seem that the remedy may easily be worse than the disease.

In the first place the device only operates on one pole. Should an earth occur on the opposite pole, and the starter arm return to the "off" position, current will still continue to flow through the fault and probably bring the breaker out. In the event of the earth being on the same pole as the starter and the device operating the whole of the current through the fault, at practically the line voltage (less of course in a three-wire system), would be broken on the starter arm and first contact. This would be bad for the starter. Again, take the case of the "heedless operator" making persistent attempts to start up the motor with the fault on it. To energise the trip coil it is necessary, according to the diagram, to get the starter arm on the first contact. If the "heedless operator" held the arm there for any length of time he would in all probability burn out the resistance, while if he let go of the handle he would stand a good chance of getting burnt by the resulting arc. In conclusion, if it is seriously intended to place this device on the market. I would suggest that the insulated wire be taken to the trip coil via the frame of the starter or control panel as this is quite as liable to trouble as the motor.

Ernest F. Butler.

London, W.C., January 18th, 1915.

Stray Magnetism from Tramway Feeders.

A jeweller in this town complains that owing to one of our tramway feeders being within 10 ft. of his shop window the watches in his shop become magnetised, and an ordinary compass fixed in the window certainly shows considerable movement. I should be very much obliged if any of your readers would explain this, and, if possible, suggest a remedy. Our cables and insulation are in good order, and so far as I know there is no leakage from the tramways overhead equipment. The jeweller's shop has been in its present position for about six years, and it is only within the last few years that the watches have become magnetised, and within the last six months more than usual. If you, or any of your readers, could give me a solution I should be extremely obliged.

Magnet.

[At the distance stated, a current of 1,000 amperes would produce a field of less than 1 c.o.s. unit.—Eds. Elec. Rev.]

WAR ITEMS.

Australians and Electrical Contracts.—According to a report in the "Sydney Morning Herald," the Sydney Council Electric Lighting Committee on October 26th affirmed the principle of British preference. We quote our contemporary's statement without alteration in order that the reader at home may observe how these matters are viewed in Australia. "Several tenders for electrical supplies had been tralia. "Several tenders for electrical supplies nad been received, including one from an American firm and another from a German firm. Alderman Meagher said he did not intend to make a spread-eagle display of patriotism, but, taking a cold common-sense view, he thought they would all see the wisdom of giving preference every time to Empiremade articles. He moved that a recommendation be made to the Council that during the currency of the war a preall see the wisdom of giving preference every time to Empiremade articles. He moved that a recommendation be made to the Council that, during the currency of the war, a preference to the extent of 10 per cent. be given. He was inclined to make the margin still bigger, but the Federal tariff, he believed, already gave a slight preference. Alderman Lindsay Thompson considered that they should not only give preference during the war, but for all time. He hoped that the Council would set an example to the public, and not go crawling back to the cheapest market, irrespective of what market it was, as soon as the war clouds rolled away. Alderman Hagon stated that he had been informed that no less than 90 per cent. of the firms trading in electrical goods in England were actually German firms, although they did not all bear German names. Some of these companies had an English director holding a few shares, but the great bulk of the profits went to Germany. these companies had an English director holding a few shares, but the great bulk of the profits went to Germany. The Council, therefore, needed to be very careful how it acted. Alderman W. P. M'Elhone remarked that, in view of this statement, they might actually give an advantage to a German concern under a British name if they failed to make the fullest investigation. He was in full sympathy with the motion. Alderman Meagher suggested that each tenderer be requested to furnish a certificate containing certain data. Ultimately the matter was left in the hands of a sub-committee, consisting of Aldermen Stephen and Meagher, the Town Clerk (Mr. Nesbitt), and the City Electrical Engineer (Mr. Mackay)."

The War and Factory Premises.—In their report for 1914

neer (Mr. Mackay)."

The War and Factory Premises.—In their report for 1914 Messrs. Leopold, Farmer & Sons, of Gresham Street, E.C., state that the year was far better than 1913 in respect of sales and letting of factory property, wharves, land, etc. This result is in a large measure due to the war, which has produced a demand for factories and commercial property, partly to war equipment, and secondly for the manufacture in this country of goods previously imported. The firm report that an unprecedented demand still exists for properties of all kinds, and they have disposed of a large number of factories with and without plant and machinery at figures running into many thousands of pounds. Premises that previous to the war had failed to find tenants for years have been rapidly taken up, owners in many cases having obtained increased prices through competition. The firm add:

""The Declaration of Peace should mean the opening up tained increased prices through competition. The firm add:

—"The Declaration of Peace should mean the opening up
by our manufacturers of an enormous overseas trade both
with our colonies, new possessions, and the world's markets
in general, and then will come the time for us to 'capture
the trade' hitherto to a large extent held by Germany. We
can safely say the outlook for further deals in factory property is good, and think we are justified in hoping to report
a continuance of the demand and supply of commercial properties of all descriptions in the present year."

Capturing 6 maps. Trade—Referring to the note in "War

Capturing German Trade.—Referring to the note in "War Capturing German Trade.—Referring to the note in "War Items" in our last issue concerning the Board of Trade Electrical Exchange Meeting, the Walsall Electrical Co., Ltd., inform us that they are manufacturing milli-ampere meters similar to those on exhibition, and are also making various pocket type meters which were illustrated. They have every confidence in stating that as soon as the labour and material markets resume their normal conditions they will be able to supply these various items at the same price as the Germans and Austrians have hitherto sold them at. They have on their books at present orders for over 800 They have on their books at present orders for over 800

milli-ampere meters, the greater portion of which are for use in connection with telegraph and telephone work, and about one-third for use in connection with medical work. The company state that they are laying themselves out "to manufacture certain items in large quantities, and thereby departing from the usual practice of British manufacturers of making everything but making nothing well." It is only by receiving support from the wholesale houses and exporters that they will be able to do so, and they look with every that they will be able to do so, and they look with every confidence for this support. We congratulate the company on the enterprise exhibited, and hope that the results will be all that they could wish.

The Industrial' Situation in Denmark.—The director of the Northern Cable & Wire Works, of Copenhagen, is reported to have stated in a communication to a local newsported to have stated in a communication to a local newspaper that great difficulties are experienced in connection with the procuring of the requisite stocks of lead, copper and rubber, and that, in his opinion, the export veto of the Danish Government ought to be sufficient security to the British Government against any re-export of these materials to Germany. Nevertheless, the British Government prevents the export of such materials which have been purchased by Danes in England, and also hinders the obtaining of supplies from America. As a consequence, it is said that the Danish copper and lead rolling mills and the lead cable works have been compelled to suspend their activity, whilst the electrical firms and other industries keenly feel the effects of the prevailing scarcity of raw materials.

Sydney Municipal Council and its Contracts.—Our contemporary "Tenders" states that the following recommendations have been made by the Sydney electric lighting committee:—That in connection with contracts which have been affected by the war; the following be approved and adopted:—

(a) That the Council allow to a contractor, as an extra on his contract price.

adopted:—

(a) That the Council allow to a contractor, as an extra on his contract price, in respect of contracts entered into before the outbreak of the war, not exceeding freight and insurance paid by him in consequence of the war, not exceeding the actual amount of his actual loss. That the contractor be asked to satisfy the Council's general auditor upon this question is any case where a contribution is sought.

(b) With regard to contracts, tenders for which were received before the outbreak of war, but acceptances of which were not sent out by the Council until after the outbreak of war, the Council's acceptance be of the tender at the price mentioned in the tender, with the extra freight and insurance (if any) which the contractor can show to the satisfaction of the general auditor he has been compelled to pay ever the ordinary rates, the extra amount being due to the abnormal conditions caused by the war.

Board of Trade Assistance.—In connection with their campaign to assist British manufacturers and merchants to secure trade formerly in the hands of German or Austro-Hungarian firms, the Board continue to receive a very large number of inquiries for the names of sellers or buyers of articles of which the sources of supply or market have been

number of inquiries for the names of sellers or buyers of articles of which the sources of supply or market have been interfered with by the war. The seventh list of articles which inquirers desire. (a) to purchase and (b) to sell, is now ready and may be obtained, together with copies of the previous lists, on application to the Branch.

Telephones Wanted.—With reference to the appeal of the National Service League for telephones which appeared in our issue of January 1st (page 17), we learn that generous and greatly appreciated assistance has been rendered by Messrs. J. B. Saunders, Ltd. (railway telephones), General Acoustics & Dictaphone Co. (loud speaking telephones), and the Western Electric Co., Ltd., who are sending two of their Lister portable telephone sets of the regular military pattern. Probably there are others who have such apparatus that they Probably there are others who have such apparatus that they will be willing to place at the disposal of the League.

Prices of Installation Materials in Germany.—It was reported about the middle of December that the prices of installation materials had been advanced by the Bergmann Co. by 10 per cent: in consequence of the increased cost of all raw materials, and partly finished manufactures, particularly in the case of metals, and that other firms would probably follow the example. It is now announced that the syndicate of makers of installation materials has raised prices by from 10 to 25 per cent. Awing specially to the greater cost of 10 to 25 per cent., owing specially to the greater cost of copper and rubber.

The R.A.C. and X.Ray Apparatus. → The "Auto-Cycle Journal" states that a subscription has been started at the Royal Automobile Club with the idea of presenting a full X-ray apparatus with a petrol-electric set to supply the necessary current to the Officers' Base Hospital at Havre.

Blackpool Lights.—The arc lamps on the Blackpool

Promenade are being blackened on the seaward side, in anticipation of an order by General Adam, commanding the Territorial Division in Blackpool.

Manchester Roll of Honour.-A roll of honour has been prepared by the Manchester Tramways Department on which the names of 1,232 employes of the tramway department who are serving with the colours' have been inscribed.

Personal.—Mr. Edward S. Carling, who has represented the Electrical Co., Ltd., in the South of England for the past ten years, has been called up under the householders' return, and has joined the Royal Engineers.

Mr. C. I. Oake, second engineer-in-charge at the Bermondsev Electricity Works, has obtained a commission in

the Army.

Roll of Honour.—Sergt. Wm. Deakin, of the 1st Manchester Regt., for five years a car-driver in the Salford Corporation Tramways Department, has been killed in action. He was 32 years of age, and had served in South Africa.

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

Adapter for Small Cooking Apparatus.

When an electric kettle, say, is connected to the circuit by plugging into a lampholder, the lamp is necessarily put out of use for the time, and is liable to be broken in repeated handling. To do away with this inconvenience, the GENERAL ELECTRIC CO., LTD., of 67, Queen Victoria Street, E.C., have patented an adapter, illustrated herewith, which keeps the lamp in use. It will be seen

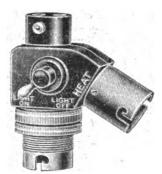

FIG. 1.-G.E.C. TWO-WAY ADAPTER.

that the device consists of a two-was fitting, the lower way receiving the lamp, and the side socket providing for the heating circuit. A little turn switch enables the lamp to be lighted or extinguished, as desired, without interfering with the heating circuit. The latter may take up to about 3 amperes. Small nuts on the pins of the plug enable the adapter to be fixed firmly to the lampholder.

Henley Fuse-Boxes.

MESSES. W. T. HENLEY'S TELEGRAPH WORKS Co., LTD., of Blomfield Street, London Wall, E.O., have for some years specialised in self-contained fuse-boxes and scaling chambers, and we illustrate in fig. 2 one of a number of similar devices contained in their latest list of service fuse-boxes. The figure illustrates a 20-30-ampere DP. fuse-box with hinged cover, and below, and combined with it, is a three-way scaling chamber.

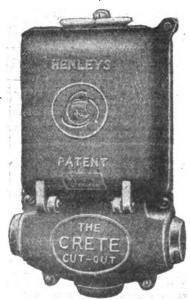

FIG. 2.—HENLEY FUSE-BOX AND SEALING CHAMBER.

This set is very compact, weighing only $4\frac{1}{4}$ lb., and measuring $8\frac{1}{2}$ in, long \times 5 in. wide \times $2\frac{1}{4}$ in deep overall. A particular feature of these out-outs is the separation of the

A particular feature of these cut-outs is the separation of the sealing chamber from the fuse chamber by a horizontal iron diaphragm cast integrally with the box, the holes through which the bare conductors pass to the terminals being insulated with porcelain bushes. The sealing chamber is designed to take either vertical or horizontal service cables.

Veritys' Fixtures.

A new edition of Vol. 3 of their catalogue of electric supplies has been issued by MESSER. VERITYS, LTD., of King Street, Covent Garden, W.C. It is a fine production of more than 500 pages, and in the work of illustration, which is most excellently and lavishly done, a highly glazed art paper lends considerable assistance. The volume is a business-like production, and in style, size, &c., is uniform with Vol. 2, to which we referred several months ago, though, of course, it is bulkier. Introductory notes in the English, Spanish and French languages are followed by serviceable general

codes, including measurements and technical and commercial phrases. By the way, the firm is shortly to publish a schedule of prices and particulars in the language and coinage of various countries, a further effort in the Verity bid for export trade; there is nothing so likely to win the favour of the foreign purchaser as putting before him in his own tongue, and in ways that he can understand, the information

FIG. 3.-VERITYS TWO-LIGHT BRACKET.

of which he is in need. Alphabetical and numerical sections lead us to the descriptive and illustrative part of the catalogue, which is divided up into 18 sections. We might enter into a great deal of comment by way of eulogy, perhaps tempered with only a very small amount of the spice of mild criticism, concerning the hundreds of varieties of designs and types that are illustrated and priced, but seeing that a fittings catalogue is intended for all tastes

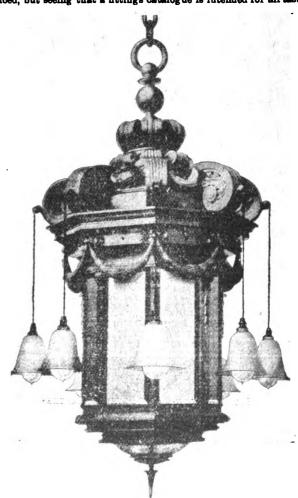

FIG. 4.—LANTERN FOR ENTRANCE HALL.

and all types of men—and women—whatever we might say could not be representative of anybody's thoughts save our own, and in matters of detail such as this that is not called for. Some of the fittings lead us on to thoughts of marble halls and country houses, others into industrial surroundings such as obtain in mills and factories, others into the ships in the North Sea, yet others into hospital life, or into the streets which will be better lighted again someday, and to shops which will light electric signs more brilliantly

when little Willie's Imperial Father sues for peace, but we forbear, and fall back upon the process summary of the contents given in the front of the catalogue in order to show the character and the the front of the extalogue in order to show the character and the wide extent of the fixtures covered in the book. This summary runs thus, and it appears in the three languages already mentioned (as do also the illustrations, of course, though the accompanying matter does not):—One, two and three-light brackets, pendants and indirect and sliding ditto, shade and ceiling lights, electroliers, standards, French brackets, lanterns and electroliers, bronse statuettes, hospital fixtures (a complete selection of designs), radiators, watertight and street lighting fixture, signs, glass shades and bowls (here the firm does not conceal it indules in a forecast that radiators, watertight and street lighting fixtures, signe, glass shades and bowls (here the firm does not conceal its regret that British glass makers have been remiss in the past and it indulges in a forecast that such will be a less pronounced weakness in the future), silk shades, switchplates and accessories. We select a couple of examples of fittings for the purpose of brightening this notice, though we cannot expect thereby to do more than give the reader a taste to see those on the other 400 odd pages. Our fig. 3 is an example of two-light bracket work, and fig. 4 is an impressive lantern form of electrolier suitable for the entrance hall of a large public building. That Veritys is a British house, that it is perhaps the oldest house associated with our electrical industries, that it has long specialised in the design and manufacture of electric light fittings, are matters upon which it is hardly necessary to dwell at this date, but when so much is being said about the constitution, &c., of different firms, it should be made clear here that its capital, directorate, management and staff are "entirely British." It may also be added that large stocks of the manufactures here catalogued are on exhibition at the firm's various showrooms in London and the provinces, that most of the contents of the book are easily adaptable for the requirements of the Canadian, South American and Continental markets, and that the firm will welcome applications for copies of this handsome volume.

Street Lighting Fitting.

THE WARDLE ENGINEERING Co., LTD., of 196, Deansgate, Manchester, have sent us particulars of a fitting designed to eliminate upward rays, and give wide distribution of light on the ground, which should be very suitable for use under the existing lighting régime.

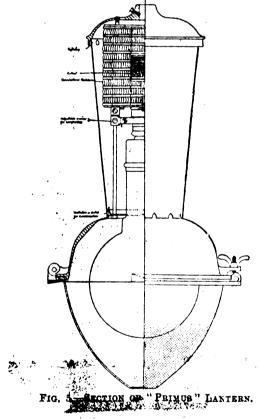

Fig. 5 is an illustration of the No. 515 Primus lantern, from which it will be seen that the filament does not project below the

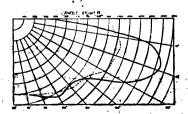

FIG. 6.—POLAR CURVE OF "PRIMUS" LANTERN.

bottom of the internal reflector. The polar curve, fig. 6 (taken by the Manchester Corporation testing department) shows an increase by nearly 50 per cent. of the candle power at 17° below the horisontal; if the height of the lantern is 25 ft., the 17° ray will reach a radius of over 80 ft., whereas a 30° ray will only reach a radius of 44 ft. To obtain even illumination it is, of course, very important to get the maximum candle-power very near to the horizontal, but this is very difficult if upward rays and glare are to be eliminated.

THE MAGNETISATION OF IRON.

By J. S. NICHOLSON, B.Sc., A.M.I.E.E.

(Abstract of paper read before the Institution of Electrical Engineers, at Glasgow, December 8th, 1914.)

In the testing of iron stampings at high flux densities by means of alternating currents, great difficulty is experienced in maintaining an electromotive force of sine-wave form at the terminals of the magnetising winding, and in ensuring that the electromotive force induced in the windings of the tester shall also be of sinewave form.

If the induced electromotive force varies according to a simple

If the induced electromotive force varies according to a simple sine function of the time, then the flux density in the core of the tester will also vary according to a simple sine function of the time, so that B_m the maximum value of the flux density can be obtained in the usual way from the induced electromotive force and the number of turns in the secondary winding, &c.

If, however, the flux and therefore also the induced electromotive force do not vary in this way, it becomes difficult to ascertain, even approximately, the value of the maximum flux density in the core corresponding to a particular value of the induced electromotive force. The author shows how at flux densities with maximum values of 20,000 lines per sq. cm. and upwards in Stalloy the flux in the tester core was approximately maintained as a simple sine function of the time.

simple sine function of the time.

Some idea of the possible divergence of the wave-form of induced electromotive force from the simple harmonic form, and of the electromotive force from the simple harmonic form, and of the magnitude of the error in B_m when calculated, may be obtained by a study of the oscillograms reproduced in fig. 1. These were obtained from a ring tester connected between two lines of a 40-K.V.A. star-connected three-phase alternator giving an electromotive force of simple sine-wave form on open circuit. The induced electromotive force in a search coil corresponded to values of B_m of 17,500 and 20,000 lines per sq. cm. respectively, but the actual values were 16,600 and 18,100 respectively.

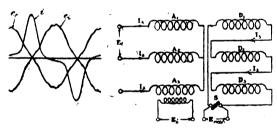

Fig. 1.—Oscillograms of e_i , i and e_i .

2.-THREE SIMILAR RING TESTERS EACH WITH TWO MAGNETISING WINDINGS, A AND D, UNIFORMLY DISTRIBUTED. THE A WINDINGS ARE STAR-CONNECTED, AND THE D WIND-INGS MESH-CONNECTED AND SHORT-CIRCUITED.

The above results are typical of what may be expected when The above results are typical of what may be expected when tests at high flux densities are being carried out with an alternator of medium size, and they illustrate how misleading would be acrive showing the number of watts lost in the iron core of the tester if such a curve were plotted against the induced electromotive force or against B_m (apparent). The correction which must be applied to the apparent value of B_m increases so rapidly that it is probable a point may soon be reached at which, with increasing terminal electromotive force, the maximum value of the flux density in the tester core actually begins to decrease.

The divergence of the terminal electromotive force from the

The divergence of the terminal electromotive force from the simple sine-wave form is mainly due to the presence of higher harmonics in the magnetising current.

In order that each of the harmonics of this current may be maintained in the circuit of the tester and alternator there must be an electromotive force of corresponding frequency acting in the circuit. If we assume that there is no third harmonic in the alternator's induced electromotive force, then the only possible source of this electromotive force is the tester. The tester behaves like a frequency converter, taking in power from the alternator at the fundamental frequency f, and delivering power to the circuit

the fundamental frequency f, and delivering power to the circuit at frequencies 3f, 5f, 7f, &c.

The author has been experimenting for a considerable time with testers having two distinct magnetising windings. One of these windings carries the triple-harmonic component of the magnetising current, I_0 , and multiples thereof, while the other winding carries the fundamental and all other components of the magnetising current.

A simple method of isolating I_3 and of limiting the magnitude of the electromotive force, E_3 , necessary to produce I_3 is illustrated in fig. 2. The magnetising windings, A_3 , are supplied with currents I_4 from a star-connected three-phase alternator, giving a

sine-wave electromotive force on open circuit. The currents, In. will have no third harmerics, but they will include the 5th, 7th, 11th, &c, harmonics. The D windings, being mesh-connected, can only carry currents of triple frequency; or multiples thereof. With switch 8, in mesh windings D, closed, the resultant mesh

With switch 8, in mesh windings D, closed, the resultant mesh voltage, 3 E_8 , sends a current I_8 , of triple frequency round the mesh circuit. This secondary current, I_8 , and the primary current, I_A , combine to give a total magnetising current, $i=i_A+i_8$, this producing a flux which is very approximately of simple harmonic form. The resultant mesh voltage, 3 E_8 , becomes very small, since it is now approximately equal to $I_8 \times 3 r_D$, where r_D is the resistance per phase of the windings D.

Oscillograms of I_A , I_8 , I_8 , I_8 , per phase, and E per line of three-phase alternator, are given in fig. 3.

Instead of allowing the iron cores to generate their own third-

Instead of allowing the iron cores to generate their own third-harmonic electromotive force and current, we may entirely eliminate the triple-harmonic component of the induced electro-motive force, and also avoid the determination of the mesh copper motive force, and also avoid the determination of the mesh copper watts by connecting the terminals of the mesh circuit to a single-phase alternator giving an electromotive force of the required frequency and magnitude. The resulting current, I_a , is then adjusted in magnitude and in phase with reference to the current, I_a , in the star-connected windings until the resultant induced mesh voltage is zero, and, neglecting terms of frequency 5f, 7f, &c., the flux density in the cores varies according to a simple harmonic law. Experiments on these lines have been carried out by the author at intervals during the past 18 months and a number of interesting results have been obtained.

Tests were carried out at 22 5 and 15 cycles per second. The results are given for temperatures of the Stalloy cores of 55° to 65° C. The B-H curve, fig. 4, for the Stalloy cores was obtained by the method of reversals. The core losses have been analysed in the

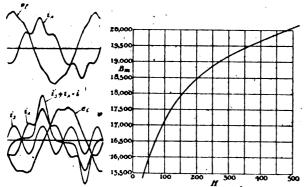

FIG. 3.—OSCILLOGRAMS WHEN $B_m(APPARENT) = 17,500$.

Fig. 4.-B-H CURVE FOR STALLOY CORE.

usual manner into hysteresis and eddy-current losses, and curves of hysteresis losses plotted against B_m are also shown in fig. 5.

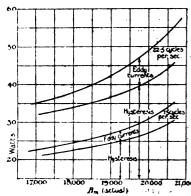

The index of B_m in the hysteresis formula was found to be 1.58,

The index of B_m in the hysteresis formula was found to be 1'58, from 17,500 to 19,500 lines per sq. cm.

For values of B greater than 19,500 lines per sq. cm. the index seems to be greater and the constant, η , smaller. The flux density in the tester cores consisted mainly of a simple sine function of the time with a very small fifth harmonic ripple which did not exceed 3'2 per cent. of the fundamental term. The total corrections at 22'5 cycles per second amounted to 1'6 per cent. at B (apparent) = 18,000, and to 4'15 per cent. at 21,000.

Referring to the use of static transformers as frequency.

Referring to the use of static transformers as frequency changers, the author draws attention to the relations which hold between the various harmonics of the magnetising current

-STALLOY CORE FIG. 5.-LOSSES.

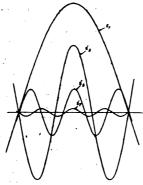

FIG. 6.-ANALYSIS OF MAGNETISING CURRENTS,

for flux densities in the Stalloy cores ranging from 17,000 lines per sq. cm. to 20,500 lines per sq. cm. (actual maximum

Fig. 6 shows the analysis of the current i into its harmonics, and may be taken as typical of all the current waves from the tests. It will be seen that the peak in the magnetising current is due to the approximate coincidence of the peaks of all the various

In the above investigation the aim has been to obtain a flux in the Stalloy cores varying according to a simple harmonic law, this manner of variation being considered ideal. The deviation of the manner of variation being considered ideal. The deviation of the actual flux from the apparent flux is mainly due to the fifth-harmonic component of the flux. This harmonic would practically disappear if the fifth harmonic in the magnetising current could be short-circuited in a manner similar to that of the third harmonic, Is, as in fig. 2 when the switch s is closed. This method being impossible with three-phase currents and three testers, the next best method, probably to insert condensers and variable inductances between the lines of the three-phase circuit and gradually to vary the inductances until resonance with the fifth harmonic is obtained. Considerable success has already been attained by shunting the fifth harmonic in this manner.

DISCUSSION.

Professor Baily (Edinburgh) said that Mr. Nicholson's method was most ingenious—the method of using a three phase system and using the mesh winding to emphasise the triple harmonic and star windings to stamp it out. Twenty years ago he had to use the calorimeter method. They did not in those early days trouble much about the triple harmonic, but what he had done was, as Mr. Nicholson had cointed out to over-estimate the flux

monic, but what he had done was, as Mr. MICHOISON MAD pointed out, to over-estimate the flux.

Mr. Hird (Glasgow) thought the paper appeared more fitted for a society of pure physics than for that Institution. The theory of the paper, however, seemed to him to be a very reliable contribution to the science of the magnetisation of iron. As to the value of such an elaborate method purely from the testing point of view he had some doubt. When from the testing point of view he had some doubt. When they measured the losses in the iron circuit of a dynamo where they had the dimmest notion as to what the flux would actually be, and what the respective densities were in each different part, the nearest approach such as they got in commercial testing was, he thought, quite as useful and as serviceable as the most elaborate methods which could be

evolved.

Mr. W. W. LACKIE (Glasgow) said that the point in the paper about the third harmonic appearing in a star-connected transformer brought to his mind the case of a star-connected choke coil on a static balancer in connection with a continuous-current machine. The simplest form of this was two slip rings and a single choke coil, the middle-wire connection being taken from the middle of the choke coil. This did not give particularly good balancing, and the next step was to have four slip rings and two choke coils, the middle points of each being connected together and the middle-wire connection taken from this. It was suggested that the star-connected choke coil connected to three slip rings might be used, but he was informed by a manufacturer that this had been tried and they had been bothered with a third harmonic giving functuating pressure.

fluctuating pressure.

Mr. A. S. MacWhirter (Glasgow) said that the advantages of using a three-phase tester in preference to a single-phase tester were very striking, viz., the elimination of the third harmonic in the star-connected windings, and the possibility of supplying the required triple harmonic component of the magnetising current in the mesh windings. There was also the advantage that the wattmeters connected as shown were measuring

that the wattmeters connected as shown were measuring the power at a much higher power factor than would be possible with a single-phase tester and the likelihood of errors in the wattmeter readings was thus diminished.

Mr. A. L. Tackley (Glasgow) said the results of the paper showed that within the limits of maximum flux density 17,500-20,000 lines per cm² the shape of the magnetising current wave to provide a sine wave of flux reaching to high flux densities was approximately constant. He had mathematically worked out exactly the conditions necessary in order that the shape of the current wave might be truly constant.

Mr. B. Parker Haigh, in a written communication, stated that in the ordinary Epstein iron testing apparatus the wave of flux deviated very considerably from the sine wave, and

that in the ordinary Epstein iron testing apparatus the wave of flux deviated very considerably from the sine wave, and the iron losses determined in this manner did not truly represent the losses for any particular flux density with simple harmonic variation. Mr. Nicholson had previously shown how several difficulties were overcome when the watts were measured by means of a secondary coil, wound within the primary coil of the Epstein apparatus, and it seemed regretable that such a coil was not more generally employed. It was not easy to appreciate the advantage of using a sine wave flux, for by integrating the oscillogram of induced E.M.F., it was simple to ascertain the maximum value of the flux—upon which alone the hysteresis loss per cycle was believed to depend. But unless the wave form was constant, a difficulty But unless the wave form was constant, a difficulty existed in separating the eddy current and hysteresis losses, and it was there that improvement on ordinary methods was desirable.

desirable.

Dr. ALEXANDER RUSSELL (Faraday House, London), in a written communication, said that Mr. Nicholson's researches proved that it was absolutely necessary to know the law according to which the magnetic flux density in the core of the sample under test varied. On the other hand, those who sent samples of iron to be tested usually specified that they wanted the watts lost per pound at a given maximum induction density and at a given frequency, the wave of potential difference applied to the magnetising coil being sine-shaped. difference applied to the magnetising coil being sine-shaped. From the oscillogram of the induced electromotive force in the secondary coil they could easily find the area A' of the positive

(or negative) half of the E.M.F. wave. From this they found at once that the maximum value of the flux density in the core in this case $Bm = 10^8 A'/(2nA)$ where n was the number of turns in the secondary coil and A was the cross sectional area of the iron. The value of B_m must be found in order to get the Steinmetz coefficient for the hysteresis loss. In order to calculate the eddy-current losses they found from the oscillogram of the E.M.F. wave, in the same way as shown in the paper, the values B_1 , B_3 , B_5 ... for the harmonics of the flux density. Then, making the assumption that the amplitudes of these harmonics were approximately constant over the cross section of the iron strips, the eddy-current loss per cubic centimetre of the iron was given by current loss per cubic centimetre of the iron was given by

1.64 $(t^2/\rho) f^2 (B_1^2 + 9 B_5^2 + 25 B_6^2 + \dots)$

where t was the thickness of the strips in centimetres and ρ equalled the resistivity of the iron in C.C.S. units (about e equalled the resistivity of the iron in C.G.S. units (about 10,000). As the wattmeter reading gave them the sum of the hysteresis and eddy-current losses they could, if they knew the Steinmetz index, easily find the Steinmetz coefficient. Mr. Nicholson's method of getting a sine-shaped flux, whilst most ingenious, was rather too complicated for every-day use. Mr. D. J. MACKELLAR wrote asking Mr. Nicholson whether the magnetic leakage at the high flux densities employed had been found to have any appreciable effect on the flux distribution in the tester cores, and whether it could be reasonably assumed that the flux density was uniform over the whole tester.

tester. Mr. A. M. TAYLOR (Birmingham), in a written communica tion, said that the information contained in the paper, had it appeared a year ago, would probably have saved mistakes in the design of a frequency-changer which proved expensive to rectify. He described his own large-scale experiments, and said that Mr. Nicholson's connections were virtually those of

Mr. Nicholson replied to some of the points raised, and deferred detailed reply to the report in the Journal.

BUSINESS NOTES.

Deed of Assignment.—L. FAWCETT, automobile and electrical engineer, Leeds.—Claims must be sent in by February 13th to the trustee, Mr. C. H. Baker, 1, Albion Street, Leeds.

Edinburgh.—THE NORTH BRITISH RUBBER Co., it is understood, have received large orders from the Admiralty and War Office which, along with their general business, necessitates a considerable addition to their factory.

Book Notices .- High-Speed Telegraphy is the title of BOOK NOTICES.—High-Speed Telegraphy 18 the title of a handsome brochure issued by Messrs. Creed, Bille & Co., Ltd., which describes the Creed system and its progress during the year ending June last. It has been adopted by a number of British Colonial and foreign Governments, cable companies, newspapers, and the British Post Office, and the makers claim that it has solved the problems of high-speed telegraphy. The Marconi Co. has adopted the system for its circuit between London and Towyn, in connection with the trans-Atlantic service, and it has been used largely by submarine cable companies for many years. Nothing could be more satisfactory than the enthusiastic letters from the proprietors of leading newspapers as to their experience with the Creed system. more satisfactory than the entinusiastic letters from the proprietors of leading newspapers as to their experience with the Creed system. The apparatus, which was described in the ELECTBICAL REVIEW in 1907 and 1908, is now capable of working at a maximum line speed of about 200 words per minute, and instances are cited in which it has run for periods up to eight hours without stopping, at 140 words a minute. It is gratifying to note that, as the high-read telegraph was described in this counter so, actill lead the speed telegraph was developed in this country, so we still lead the

speed telegraph was developed in this country, so we still lead the world in this respect.

"Records of Railway Interests in the War." Part I. British, August-December, 1914. London: The Railway News. 1s.—This publication contains portraits of the heads of our great railway systems, and tells much concerning the all-important part that they have been, and are being, called upon to perform in the transport of troops. Most interesting and excellent pictures are given showing the equipment of trains for conveying the wounded.

The Engineering Standards Committee has issued an interim

showing the equipment of trains for conveying the wounded.

The Engineering Standards Committee has issued an interim report on British Standard Sizes of Single-Row Ball Journal Bearings for Automobiles (C.L. 2,582). The Committee is also dealing with the question of specifying suitable tolerances to be allowed, and a complete report will be issued at a later date. The report can be had gratis on receipt of postage 1d, from the Committee, 28 Victoria Street S.W.

"A.E.S.E. Progress" is the title of the official organ of the Association of Electrical Station Engineers, of which the first number, 28, Victoria Surce, "A.E.S.E. Progress dated January 15th, has been received; it will be issued monthly to the members. In a foreword the hon, secretary, Mr. W. J. Ebben, who appears to be the editor, points out that while for the present the active efforts of the Association to remedy the troubles of its members have necessarily ceased, at the close of the war there will be more men than jobs available, and a strong organisation is necessary to prevent the reduction of salaries. The journal is, therefore, intended to maintain interest in the Association, and to increase the membership. The attitude of the I.E.E. towards the A.E.S.E. is discussed by J. W. Thomas, a couple of short stories follow, and about half the journal is devoted to Association affairs and correspondence. It is a neat and creditable production, and should prove a valuable aid to the Association's

"Journal of the Institution of Electrical Engineers," Vol. 53, No. 240; January 15th, 1915.—This issue contains papers on "Automatic Protective Switchgear for Alternating Current Systems," by E. B. Wedmore, and "Coal and its Economical Use," by P. S. Thompson. There is also a "First List" of over 600 Members of the Institution who are serving with the Colours.

Calendars and Diaries.—Mr. P. D. Morris, of 26, High Street, Islington, N., is sending out to his friends a refill pocket notebook on the multi-ring loose-leaf principle.

motor-converter and a list of users, also a comparison of same with rotaries and motor-generators.

THE GENERAL ELECTRIC Co., LTD., 67, Queen Victoria Street, E.C.—Leaflets dealing with the "Geekodust" demon-grip continuity fittings, and electrical novelties in the shape of pocket lamps, torches and portable lamps and refills.

BRITISH THOMSON-HOUSTON Co., LTD., Rugby.— New price leaflet No. 4,501—B giving particulars of B.T.H. lightning arresters for c.c. circuits; also descriptive list No. 3,120 (28 pages) containing full information relating to their A.C. switchboard panels for three-phase systems up to 6,600 volts, more than half of its pages being devoted to dimensional drawings and diagrams of connections.

Private Arrangements.—Felgate Installation Co., Ltd., Broadway Buildings, Station Road, Reading.—Pursuant to the provisions of the Companies' (Consolidation) Act, a meeting of the creditors of the above was held last week at the Reading Gas Co.'s Lecture Hall, Cross Street, Reading. It was stated that the company had passed the usual resolution in favour of voluntary liquidation, and had appointed Mr. A. G. West, C.A., of Market Place, Reading, to act as liquidator. According to the statement of affairs presented, the liabilities amounted to £2,115, of which £1,180 was due to the trade, and £426 to cash creditors, while there was an overdraft at the bank of £509. The assets were estimated to realise £674, and consisted of book debts £230, fixtures and fittings £70, stock as per balance-sheet of September 30th last £333, work in hand £31, rent receivable £5, and shares in an electrical company £5. No deficiency account had been prepared, but it was stated that the present position had been propared, but it was stated that the present position had been brought about through the war. A discussion took place as to the advisability of a joint liquidator being appointed, but eventually it was decided to confirm the voluntary liquidation, with Mr. West as the sole liquidator. rivate Arrangements.—Felgate Installation Co., as the sole liquidator.

Liquidations.—The Helsby Wireless Telegraph Co., LTD.—This company is winding up voluntarily, with Mr. J. B. Edwards, of 25, Victoria Street, S.W., as liquidator. A meeting of creditors is called for January 23rd.

THE ELECTRIC Street, LTD.—A meeting of creditors is called for January 23rd.

THE ELECTRIC STORES, LTD.—A meeting of creditors was held on Friday last (January 15th), at 204, Wolverhampton Street, Dudley (Woros.).

LEITNER ELECTRICAT. Co., LTD., Maybury, Woking.—Mr. G. E. Corfield (with a committee of inspection) was appointed liquidator, December 23rd, 1914.

THE GENERAL ELECTROLYTIC PARENT Co., LTD.—Particulars of claims must be sent by February 10th to the liquidator, Mr. J. Barron, of Middlewich, Chester.

Australia.—A firm already representing several British manufacturers wishes to take up agencies for the whole of the Commonwealth for dynamos and motors, accessories, cables and flexible wire, insulators, &c. The name of the firm can be ascertained at the Board of Trade C.I. Branch in London, and communications should be addressed to H.M. Trade Commissioner for Australia, Commerce House, Melbourne.

-The Stretford U.D.C. invites tenders for the purchase of two 100-kw. engine and dynamo sets, particulars of which are given in our advertisement pages to-day. Trade Announcement.—Mr. F. MARCHANT, electrician, has removed to 2, College Road, Bromley (Kent).

Bankruptcy Proceedings.—F. I. Behrens (F. Burns), electrical engineer, Barnsley.—Trustee (Mr. B. S. Briggs, Official Receiver, 21, King Street, Wakefield) released December 14th, 1914.

ALBERT WHITELEY, electrical and mechanical engineer, Llandudno.—Receiving order made January 14th, on debtor's own petition

J. W. GARSDEN (J. W. Garaden & Co.), electrical engineer, Black-burn.—Debtor's discharge suspended for one month, on July 6th, 1914.

J. SWANISON (J. Swanison & Co.), electrical contractors, Man-nester.—A first and final dividend of 10d, in the £, is payable on January 29th, at 27, Brazennose Street, Manchester.

LIGHTING and POWER NOTES.

Australia.—A scheme is being furthered by the N.S.W. Railway Department for the utilizing of electric current in connatival Department for the utilising of electric different in contion with the Sydney metropolitan tramway system, to provide illuminating power on several of the railway stations within the suburban section. At Petersham, Newtown, Ashfield, and other stations on the main suburban lines the fittings have already been put into position. The department, it is understood, also proposes at a later date to make use of electricity as an illuminant for the stationary distance of the content of the stationary distance.

stignal disks.—Commonwealth Engineer.

The Municipal Council of Manley, a suburb of Sydney, N.S.W., has decided to consider the question of resuming the Manley electricity works and running them for the benefit of the municipality.

The St. Leonards Council (Tas.) has decided to ascertain further the largest from the Leonards Council on the question of extend

The St. Leonards Council (18s.) has decided to ascertain further particulars from the Launceston Council on the question of extending the electric light to St. Leonard's.—Tenders.

The result of the first year's working of the Port Melbourne municipal electricity undertaking with current supplied in bulk from the Melbourne City Council, shows receipts amounting to £2,512, and expenditure to £2,751. The number of private consumers is increasing every month, including several large industrial concerns attracted by the new tariff for power recently adopted.—Melbourne Acc.

The Waverley Municipal Council has entered into an agreement with the Sydney Municipal Council for the supply of energy.

The Nunawding (Vic.) Council is floating a further loan of £5,000 for the extension of the electric lighting system, and a second scheme is to be undertaken as soon as the funds and equip-

ment are available.

At Nuttagong (N.S.W.) a poll of the ratepayers resulted in favour of the proposed electricity supply and pumping scheme for the town. The scheme is estimated to cost £3,600.—Tenders.

Ballater.—E.L. SCHEME INAUGURATED.—On Decem-Ballater.—E.L. SCHEME INAUGURATED.—On December 23rd last, the electric supply system at this Scotch holiday resort was inaugurated by Mr. Duncan, of Tillycorthie, who has taken a prominent part in the inception of the scheme. The cost of the installation, some £6,000 has been borne by Duncan's Electricity Supply Co., which is lunning the system for a period of years. The installation has been carried out by Messrs. T. C. Smith & Co., of Aberdeen, and includes at the generating station, two 68-B H.P. Fielding & Platt suction gas engines driving 42-kw. B.E.P. dynamos, working in conjunction with a Chloride battery. There are about 100 street lamps, 40 of 50 C.P. and 60 of 25 C.P. each, and 120 private consumers, the total lamp connections being each, and 120 private consumers, the total lamp connections being about 1,500. The Great North of Scotland Railway is understood to be going to wire its premises for 220 25-C.P. lamps. The distribution system is by means of overhead wires. Mr. Duncan, at a banquet held in honour of the event, expressed his regret that they should have had to use coal as fuel at their plant, owing to local opposition to the use of the ample water powers which were available in the neighbourhood. The charges for energy are 6d, per unit for lighting and 4d, per power.

Barnes.—The surveyor has informed the B.C. that in Limes Avenue where electric light is installed, the tenants wish to have gas stoves fixed, but the Gas Co.'s charges appear excessive. The electrical engineer was instructed to prepare a report and estimate for providing electric cookers.

Barnsley.-Proposed Loan.-The T.C. has agreed to apply to the L.G.B. for sanction to borrow £4,800 for electric lighting purposes.

Bawnboy (Co. Cavan).—STREET LIGHTING.—The R.D.C. has accepted the Ballyconnell Electric Light and Power Co.'s tender for lighting the town.

Beccles.-Prov. Order.-The Public Lighting Committee of the TC, has recommended that a prov. order he a plied for fratree lighting helectricity and a special meeting of the " un it a to consider the matter.

Bexley. - The West Kent Electric Co. has submitted to the U.D.C. a plan for an extension of the mains into Crayford parish, in order to supply the works of Messrs, Vickers, The proposed main will run from Eltham. Bingley.—The U.D.C. has lodged an objection with the B. of T. against the proposed Keighley Corporation Electric Lighting Extension Order, so far as it affects East Morton, and a petition against the Yorkshire Electric Power Bill.

Bournemouth.—REDUCED TARIFF.—The Bournemouth and Poole Electricity Supply Co., Ltd., has reduced the price of current for lighting to 6d. per unit, as from the March quarterly readings of the meters.

Bury.—Bulk Supply.—The agreement by which the T.C. agrees to supply electricity in bulk to Heywood T.C. has now been completed.

Carlisle.—RESTRICTED HOUR TARIFF.—At a meeting of the T.C. on the 12th inst., a resolution passed by the Electricity Committee that in the case of bulk supplies of energy under agreement, on the restricted hour system, the fixed charges be reduced from £4 5s. to 15s. per KW. of demand per annum, was referred back. A long discussion took place, in the course of which it was urged that such action by the Electricity Committee would lead to corresponding reductions by the Gas Committee, and result in less all round.

Chesterfield.—The T.C. has reduced the charge for current for lighting in the Whittington district from 41d. to 31d. per unit.

Chile.—A decree has been published approving the project presented by Don Federico Baechler for the installation of an electric lighting system in the town of Paente Alto, in the Department of La Victoria.

-The T.C. has decided to augment the Colchester.supply of current to the Lexden district by laying a further cable, at a cost of £235. This will enable the sub-station plant to be driven from the lighting mains instead of the tramway mains as

Continental. — France. — In Paris, which has not yet been subjected to lighting restrictions to anything like the extent that London has, the military authorities have submitted proposals to the Government for diminishing the volume of outside and private lighting; this is also to apply to the suburbs of Paris, especially to the workshops where work is carried on night and day, and the light is visible from a distance.

Edinburgh.-Prov. Order.-The T.C. has approved of the Corporation Prov. Order, 1915, subject to a modification of one clause, in which the power to supply energy to lessees of new tramways has been abandoned.

At a recent meeting of the Merchants' Association, the T.C.'s proposal to trade in electrical fittings and open showrooms were keenly discussed, a deputation from the Contractors' Association attending. Mr. Stevenson, convener of the E.L. Committee, voiced the Corporation's views on the matter, pointing out that the proposal was not to sell anything or to do any wiring. He was convinced that there was a great future for hiring in the city, and that people would not hire from the individual trader.

Epsom.—School Lighting.—The U.D.C. has entered into an agreement with the College authorities for a three years' supply of current, on the following scale:—Minimum of 3,000 units, 4d. per unit; 3,000 to 6,000, 3½d.; 6,000 to 9,000, 3d.; 9,000 to 12,000, 2½d.; as soon as the consumption arrives at a minimum of 12,000 units per annum, the charge to be on a flat rate of 3d.

-FAILURE OF SUPPLY.-Owing to a breakdown of the engines and to the water turbine becoming water-logged the electric light supply has been stopped for more than a week.

Harrogate.—PROPOSED LOAN.—The T.C. has decided to apply to the L.G.B. for permission to borrow \$500 for electric service mains and a similar amount for transformers.

Holme.-Regarding the Bill of the Yorkshire E.P. Co., the U.D.C. has asked for an undertaking that the Bill will not hinder the Council or a local company from running its own E.L.

Holmfirth .- Proposed Loan .- The U.D.C. has decided to apply to the L.G.B. for sanction to borrow £7,500 for carrying out the electricity scheme.

Langport.—Prov. Order.—The R.D.C. has decided to lodge objections against the prov. order for E L. being applied for by Messrs. Christy Bros., the area of supply of which includes the parishes of Compton, Dundon and Somerton.

-ISLINGTON.—PLANT EXTENSIONS.—The B.C. London.recommended to carry out extensions at the electricity works to meet the increasing demands for energy. The electric engineer has prepared reports and estimates for additional plant, coal bunkers, &c., and Mr. Albion T. Snell, the Council's courulting engi eer, is in agreement with the scheme, with slight alterations.

The Lighting Committee recommends (1) the Council to apply for saction to b.rr. w £52,757, the estimated cost of the extensions; (2) that the Liphting Committee be authorised to proceed with the necessary works; and (3) that the amount of loan outstanding in respect of boilers to be displaced be repaid out of the reserve fund of the undertaking

LAMBETH.—ELECTRICITY CHARGES.—At a meeting of the B.C. on Thursday last week, the Finance Committee reported that it had had under consideration the circular letter of the South London Electric Supply Corporation, Ltd., in which the company gave notice of its intention to increase the charge for the supply of notice of its intention to increase the charge for the supply of electrical energy for lighting purposes from 4½d. to 5½d. per unit, but to grant a rebate of ½d. per unit in cases where the corporation's supply was used as the only illuminant upon the premises. Certain members of the Committee met directors of the corporation in reference to the increased charge, who stated that proceedings had been instituted in the High Courts in respect of the proposals, and it was then thought inadvisable to pursue the matter, further. At the hearing before Mr. Justice Eve, the corporation admitted that in granting the rebate referred to, it was acting in breach of the provisions of the Electric Lighting Act, 1882, and it was willing to submit to a declaration to that effect, whereit was willing to submit to a declaration to that effect, where-upon Mr. Justice Eve made the declaration. Mr. F. Kinnaird inquired if it was not a fact that the Council and other consumers were paying 5id. per unit, whilst others were paying 5d. or less. Councillor Hunt said they were not aware of any such cases.

The Poplar, Shoreditch and Stoke Newington B.C.'s and the Loughton U.D.C. are to petition against the London and District R.S. Bill and the London E.S. No. 2 Bill.

SHOREDITCH.—The B.C., on the recommendation of the Electricity Committee, has decided to establish a municipal rifle range on ground belonging to the electricity department. The cost for

on ground belonging to the electricity department. The cost for providing and equipping the range with butta, targets, &c., is estimated at £100; wiring, £10; and rifles, £15.

ST. PANCRAS.—LOAN BALANCES.—The L.C.C. Finance Sub-Committee has again taken up with the B.C. the reductions of the outstanding periods of the 42-year loans on the electricity plant, pointing out that the Treasury had written stating its view that not only must renewals and replacements be provided otherwise than by loan, but that it was desirable to accelerate repayment of any balance outstanding in respect of plant retained for occasional use, or spare on the installation of new machiner. The B.C. asked for a conv of the correspondence with plant retained for occasional use, or spare on the installation of new machinery. The B.C. asked for a copy of the correspondence with the Treasury, and decided to adjourn the matter pending its receipt. The question for the B.C. was whether the new plant could be considered as a "renewal or replacement," and it was decided that it undoubtedly could not be so considered. The Council has already agreed to write off unpaid balances on six engines at Regent's Park station, superseded by a 5,000-kw.

The B.C. has been recommended to petition against the London Electricity Supply and the Supply (No. 2) Bills.

Lurgan.—The Council has decided to apply for powers for the transfer of the undertaking of the Lurgan Gas Light and emical Co., also to make further and better provision with regard to the supply of water and electricity.

Luton.—Proposed Plant Extensions.—The electrical engineer reports that the new plant now being installed at the electricity works together with the existing plant will be barely sufficient to supply the demands, and that it will be necessary to make arrangements, at an early date, for purchasing further plant, at an estimated cost of £27,000, exclusive of the cost of any additional major which was to recovered. tional mains which may be required.

Oakworth.—The U.D.C. is to oppose the proposed Bill of the Yorkshire Electric Power Co.

Penistone.—Workhouse Lighting.—The B. of G. has referred to Mesers. C. Hodgkinson and J. M. Marston as experts a draft agreement with the Yorkshire E.P. Co. for the supply of current to the workhouse for lighting and power.

Penketh.—In connection with the proposed electric light prov. order for the district, the Warrington Electricity Committee has saked the P.C. for the approximate number of houses in, and population of the parish.

Penshurst.—The P.C., after discussing the Electricity Extension Bill of the Tunbridge Wells T.C., has decided to oppose the application so far as Penshurst is concerned. The R D.O. has agreed to the P.C.'s action.

Penryn. - E.L. SCHEME. --Mr. Rickard, a resident of the town, has applied to the T.C. for permission to erect steel poles for overhead wires through the town for the purpose of electric lighting. The matter has been referred to a Committee for consideration.

Rawdon.—Public Lighting.—The D.C. has received a letter from the Yorkshire Electric Power Co. asking to be given an opportunity of quoting for public lighting, and has asked for a quotation for the lighting of the Leeds and Otley Roads.

St. Helier .- E.L. SCHEME .- Steps are being taken to provide a supply of electricity for the district. A company, for this purpose, has been registered, and it is hoped to have a supply of current available by the end of the year.

Selby.—E.L. SCHEME.—The R.D.C. has decided to assent to the application of the Yorkshire E.P. Co. for powers to extend the area of supply, so as to include the R.D.C.'s district,

Sevenoaks.—The U.D.C. has decided to give notice to petition against the London and District Electricity Supply Bill,

Southampton.—The Electricity Committee has decided purchase an air filtering apparatus in connection with the -The Electricity Committee has decided surbo-alternator at the electricity

South Africa.—The Worcester (Cape Province) municipality is inviting applications for its local loan of £15,000 to

cipality is inviting applications for its local loan of £15,000 to cover the expenditure on the proposed electric lighting scheme. Both the scheme and the loan are very popular.

The Caps Town City Council has decided to make a charge for connections to the electric light supply of £3 for the first 100 ft. plus the actual cost of labour and material required in providing any additional length. For several years it has been the quatom to make free connections within 100 ft. of the supply mains. The cost of connection may if desired (in cases where within 100 ft.) be paid for in 12 monthly instalments of 5s.

Surrey.—The C.C. has decided to seek protective clauses in the prov. orders for E.L. being applied for by Mr. Gilbert Allom, for the parishes of Chipstead, Couledon, Woodmansterne, Banstead, Kingswood, and Walton-on-the-Hill.

-PROPOSED LOAN.—The T.C. has received the consent of the B. of T. to the proposed site for the generating station, and has decided to apply to the L.G.B. for a loan of £10,000 for carrying out the E.L. scheme. The period for which the order was granted expires next August.

Walsall.—Public Lighting.—The T.C. has adopted Walsall.—Public Lighting.—The T.C. has adopted the recommendation of the General Purposes Committee to light: a new thoroughfare with eight electric standards, each carrying three 50-c.P. metal lamps, at an inclusive contract rate of £2 14s. 6d. per annum. The gas department offered 320 c.P. per lamp, at £2 15s. per annum. A long discussion occurred in the Council, where it was pointed out that the desire was to obtain the best form of lighting, not necessarily the cheapest. Up to the present the electricity department's share in the street lighting has been 19 are lamps, which are being converted to half-watt lamps, while the gas department has about 1,400 lamps, and, judging by the remarks made, the local gas lighting would appear judging by the remarks made, the local gas lighting would appear to be so defective as to give no guarantee that the suggested 320 C.P. would be obtained. One speaker aptly remarked: "Eternal vigilance is the price of decent gaslight."

Wells.—Prov. Order.—The T.C. is recommended to oppose the application of Messrs. Christy Bros. for a prov. order. One of the grounds of opposition is that the proposed area of supply is too restricted.

West Ham. — ELECTRIC COOKING.—The Education Committee has been recommended to install electric grillers at the Rosetta Road School.

Woodferd.—The U.D.C. has decided to withhold consent from the prov. order for E.L. being applied for by the County of London Electric Supply Co. Wanstead U.D.C. is also opposing it.

Whitstable.—The U.D.C. has decided to have the E.L. installed throughout the Council's offices. A specification is to be prepared, and tenders will be limited to local firms.

Windsor.—RESTRICTED LIGHTING.—On account of the restricted lighting order, the Windsor Electrical Installation Co. has reduced the Corporation's lighting account for the past quarter

Yorkshire Power Co.'s Bill.—At a conference of West Riding boroughs, held at Leeds, it was decided to oppose the Yorkshire Electric Power Co.'s proposed Bill.

TRAMWAY and RAILWAY NOTES.

Argentina.—Buenos Aires Underground Railway. Argentina.—BUENOS AIRES UNDERGROUND KAILWAY.

—The Compagnie Générale de Tramways de Buenos Aires of Brussels reports that the first section of the underground railway of the Anglo-Argentine Tramways Co. in Buenos Aires was opened for traffic in December, 1913, the length being 42 miles. Buring the first nine months of working the average receipts, if applied to a whole year, would amount to \$46,000 per km. per annum, as compared with \$31,200 in Parie, \$22,400 in London, and \$47,200 per km. in New York. As a consequence of the financial crisis in Argentina the construction of the second underground section has been indefinitely postooned although the hone is expressed that argentina the construction of the second underground section has been indefinitely postponed, although the hope is expressed that an extension of time will be granted by the authorities. The European war has reacted unfavourably on Argentina and a reduction in the working results of the tramways is held in prospect.

Australia.—The new tramway from Camberwell to Melbourne, via Richmond, is expected to be open for traffic next September. The work of construction is proceeding rapidly; tenders for the supply of rails have been received, and wherever possible substantial preference will be given to Australian manufactures and material in connection with the works.

The Fitzroy and Northcote (Vic.) municipalities have agreed to the construction of an electric tramway to connect with Preston.

Belfast.-Nine Months' Working. the tramway working for the nine months ended December 31st shows a balance on net revenue account, after allowing for all fixed charges, of £20,133.

Bingley.—The U.D.C. proposes to apply to the B. of T. for a further extension of time for the construction of the tramway round Rishworth Hall corner.

Bury.—The Chamber of Commerce has decided to forward the following resolution to the Associated Chambers of Commerce:—"That in the opinion of this Association considerable commercial advantage would accrue through the utilisation of municipal tramways for the transit of goods, and recommends individual Chambers to exercise their influence to further this nee"

Chile.—The German Electric Tramways Co. in Santiago de Chile has suspended operations owing to a disagreement with the local authorities, who have prevented it from charging double

Dundee.—The Corporation Tramways Committee has sanctioned the expenditure of £1,565 on the laying of larger cables in certain roads, where the existing cables are said to have led to breakdowns

Fife.--The Dunfermline and Kirkcaldy District Committees of the County Council have decided not to oppose the Dunfermline and District Tramways Order.

Opposition is to be offered by the T.C. to the proposed Caledonian Railway prov. order, which, among other matters, seeks powers to provide and work road vehicles. Correspondence has taken place with regard to the powers sought, and it has been reported to the Parliamentary Bills Committee of the T.C. that these, if passed, would adversely affect the tramway department, and are wider than those obtained in recent years by other railway companies, and that the Municipal Tramways Association, with the secretary of which the manager has been in communication, has on several occasions successfully opposed similar clauses. similar clauses

Hindley.—Running Powers.—The U.D.C. has decided to allow the Wigan Corporation to run its cars over the lines leased by the Council to the South Lancashire Tramways Co., and to assist the Corporation to obtain the best possible terms. Such running is to cease unless the Corporation undertakes within three years to construct a new line from the terminus of the existing line to the Hindley boundary.

-With a view to obtaining clauses for the protection of the borough, the T.C. is to petition against the proposed Bill of the Joint Tramways and Electricity Board, which provides for extension of tramways.

-The T.C. has decided to recommend the Stalybridge Joint Board to include in its proposed Bill a clause to provide for the running of motor-buses along Lees Road to connect with the tramways at Springhead.

Preston.—Annual Report.—The receipts for the year ended March 31st last of the Corporation tramways were £45,946, an increase of £2,675; the gross balance fell from £9,023 to £6,340, owing chiefly to increased working expenses. Out of the net sum available £1,300 was contributed to the rates, leaving £2,551 to go to the reserve fund, instead of £5,374.

Southampton.—SIX MONTHS' WORKING.—Receipts on the tramways for the six months ending September last amount on the tramways for the six months ending september last amount to \$37,000, an increase of £702 as compared with the same period 12 months previously. To get this increase an extra mileage of 128,841 was run, and an extra 148,252 passengers carried, whilst the energy consumed shows an increase of 34,287 units. The receipts per car-mile showed a decrease of 1385d. for the period under review.

TELEGRAPH and TELEPHONE NOTES.

Australia.—The Government is making arrangements Australia.—The Government is making arrangements to equip the trans-Continental railway works with four wireless plants, so as to enable the working parties to keep in touch with each other, and thus avoid delays in the exchange of instructions. The sets have been designed by the Commonwealth engineer for radiotelegraphy (Mr. Balsillie). Each will have a range of about 150 miles, but will rarely be required to work over 20 to 30 miles. They will be used chiefly at the head railway works. There is to be a truck fitted with wireless plant at the railhead on the Western Australian end of the line and another at the South Australian end. Several water-boring parties and other gangs of Australian end. Several water-boring parties and other gangs of workmen are ahead of these points preparing the way for the construction of the earth works and the laying of the rails. Two wireless plants carried in motor-cars are to accompany these parties.-The Age.

Japan.—A Bill has been introduced in the Japanese Diet to provide a sum of £115.000 for a new submarine telegraph cable between Nagasaki, Japan and Tamsui, on the Island of Formosa. The new Budget also includes a sum of £1,500,000 for the extension of the telephone system in Japan.

The Telephone Service.—Several new exchanges in London are approaching completion, and an undergraund cable, costing over \$100,000, is being laid between London and Brighton, which will provide junction lines sufficient to give a direct service without the formality and loss of time incurred by giving a trunk call. The improved service will also be extended to towns in the South of England as far as Bognor and Chichester.

United States.—The Compagnie Universelle de Télégraphic et de Téléphonie sans Fil has filed a petition in the New Jersey Courts against the German owners of the Tuckerton wirethe station, claiming that an agreement was entered into whereby the property and patents of the defendants were to be turned over to the French firm in all countries except Germany. The German company failed to complete the agreement on account of the war. The wireless station is at present controlled by the United States Naval authorities.

Middleton.—Tenders are invited for coal required at the Corporation electricity works. Mr. Pauls, Electrical Engineer.

Newcastle-under-Lyme.—February 5th. Three-wire single, L.T. paper, lead-covered cable, armoured feeder and distributor mains, for the Electricity Department. See "Official Notices" to-day.

New Zealand.—Wellington.—February 28th. Public Works Department. 18 step-down transformers, for the Lake Coleridge power scheme. Specification at the Public Offices, Wellington.

Portsmouth. — February 3rd. Corporation. Twelve months' supply of stoneware pipes, castings, street work, &c., for the Electricity Department. Forms of tender from the Electricity Station, Gun Wharf Road.

Redditch.—U.D.C. Two turbo-alternators, each 1,000 KW., with condensers, cooling tower, &c,; two synchronous motoralternators of 300 KW. and 150 KW. respectively. See "Official Notices" January 8th.

- January 27th. Tramways Committee. Rochdale. -Brection and completion of repair shops: (a) reinforced concrete foundations and car platform, (b) steelwork (steel frame), and (c) builders work. Particulars from Mr. P. W. Hathaway, Town Hall.

Sheffield. — January 25th. Corporation Tramways. Tie-bare, Specifications, &c., 10s. (returnable), from Mr. W. J. Hadfield, Surveyor, Town Hall.

Tunbridge Wells.—January 26th. Cooling tower and pipework, two water-tube boilers, economisers, mechanical stokers, pipework, and feed heater, for Borough Electricity Works. See "Official Notices" January 1st.

Warrington.—January 29th. County Borough Education Committee. Electric lighting and bell installation at Oakwood Avenue Council School. See "Official Notices" to-day.

Wigan.—January 26th. Forty tons of street tramway rails, B.S.S. No. 3, and 200 cranked tie-bars. Mr. A. J. Gooseman, Borough Engineer.

-February 4th. Generating plant, switch-Woodstock.board, battery, wiring, lamps and fittings (120 points), for the Union Workhouse Guardians. See "Official Notices" January 15th.

CLOSED.

-In connection with the new enteric fever block at Heathfield Hospital, the tender of Messrs. Reid & Co., Ayr, at £145, has been accepted for electric light installation work.

Heywood.—The T.C. has accepted the tender of Messrs. James Mills & Co. for electric motor and gas engine at Botany Bay sewage works.

Glasgow.—The T.C. Tramways Committee on Works and Stores has recommended acceptance of the following:-

Section pillar switches.—B.I. and Heisby Cables. Ltd.
Insulators for same.—Taylor, Tunnicliff & Co., Ltd.
'8 eq. in. V.I.R. cable.—B.I. and Heisby Cables, Ltd,
Conduit for Millerston Extension—Albion Clay Co., Ltd.
Motor spirit.—James Ross & Co.: Oakbank Oil Co., Ltd.; Yo
Lighs and Mineral Oil Co., Ltd.: Broxburn Oil Co., Ltd.
Benzole.—Brother ton & Co., Ltd. Young's Paraffin

The T.C. Committee on Electricity received tenders for the supply of rotary converters to be put down in the Fairfield Engineering Works, Govan, and agreed to recommend acceptance of an offer by Mesers. Dick, Kerr & Co. for three 1,000-kw. sets and two 100-kw. sets, at £7,816, it being the lowest.

Hornsey. - The Council has accepted the following tendera:

E.H.T. switchgear.—A. Reyrolle & Co., Ltd., £1,148. Eight firms and companies tendered.
L.T. generator and feeder switchboard.—Electric Construction Co., Ltd., £683. Nine firms and companies tendered.
E.H.T. cable.—Western Electric Co., Ltd., £1,099. Nine firms and companies tendered.

Chairman Moritz said that the tender for cable from a German firm was not given any consideration,

Government Contracts.—The following tenders have been accepted during the past month by the Government Departments named :-

WAR OFFICE.

Arbertos-cement sheet.—Bell's United Asbestos Co., Ltd.
Electric drills.—8. Wolf & Co., Ltd.
Electric lighting sets.—Austin Motors Co., Ltd.; Cryselco, Ltd.; Dick,
Electric lamps.—Brimsdown Jamp Works, Ltd.; Cryselco, Ltd.; Dick,
Kerr & Co., Ltd.; Omega Electric Lamp Co., Ltd.; Pope's Electric
Lamp Co., Ltd.; Rugby Lamp Co.; "Z" Electric Lamp Mig. Co., Ltd.
Telegraph equipment (leather goods).—J. Angus & Co.; Beckworths, Ltd.;
G. G. Bussey & Co., Ltd.; Hathaway, Bon & Co.; Hepburn, Gale and
Ross, Ltd.; J. A. Jacobs & Co., Ltd.; T. Keave Lycets Saddle and
Motor Accessories Co., Ltd.; McKinstry & Co.; Manufactures, Ltd.;
Martins, Birmingham, Ltd.; Philpot & Bons; J. A. Pritchard; R. W.
Stiby.
Wiring for electric lighting.—At Aghada Camp, Craig & Paton, Ltd.;
Ballykinter Camp, W. Coates & Son, Ltd.; Clandeboye Camp, Ltd.;
Ballykinter Camp, W. Coates & Son, Ltd.; Clandeboye Camp, Craig
and Paton, Ltd.; Curragh Camp, Maguire & Gatobell, Ltd.; Randalstown Camp, J. Robinson & Co.; Tipperary Camp, W. Coates & Bon, Ltd.

CROWN AGENTS FOR THE COLONIES.

Cables and boxes.—British Insulated and Helsby Cables, Ltd.
Electric cranes.—Ransomes & Rapier, Ltd.
Electro-pneumatic hammer.—B. & B. Massey, Ltd.
Telegraph poles.—Bullers, Ltd.
Wireless telegraph apparatus.—Marconi's Wireless Telegraph Co.

INDIA OFFICE, STORE DEPARTMENT.

Cells.—Siemens Bros. & Co. Dynamos.—J. Stone & Co. Cable.—Siemens Bros. & Co., Ltd. Motors.—Lancashire Dynamo Co.

POST OFFICE.

Post Office.

Laying lines of stoneware ducts.—At Ware (Watton Road), J. Mowlem and Co., Ltd.; Sheffield-Donoaster, Section 1, R. & T. Howarth; Section 3, J. W. Pearce.

Laying lines of cast-iron pipes, U troughing (with cable), and stoneware ducts.—At Hove, J. Mowlem & Co., Ltd.; at Sidoup, F. G. Brummell.

Laying lines of cast-iron pipes and stoneware ducts.—East Barking Cemetery, F. G. Brummell: at Inverness Terrace, Markewater Road, J. Mowlem & Co., Ltd.; at Waterloo, Liverpoole W.-Patitit & Co., Ltd.

Laying lines of cast and wrought-iron pipes and stoneware ducts.—Lower Clapton, N. E., G. J. Anderson; at Inverness, E. Layer Vinish; at Wattham Cross, W. Griffiths & Co., Ltd.

Laying lines of cast-iron pipes, steel tubes and stoneware ducts.—Finchley Road, N.W., D. R. Paterson, Ltd.; at Barking Grayk, J. Mowlem and Co.

Laying lines of stoneware ducts.—Victoria Street. Parliament Street.

Laying lines of cast-iron pipes, steel subes and stoneware dugis.—Finchley Road, N.W., D. R. Paterson, Ltd.; at Barking Grays, J. Mowlem and Co.

Laying lines of stoneware ducts.—Victoria Street, Parliament Street, S.W., J. Mowlem & Co., Ltd.; Museum Exchange-Gray's Inn Road, O. C. Summers.

Laying lines of underground conduits.—At Shoreditch, Stepney, &c., O. C. Summers; at Fulham, &c., O. C. Summers; at Paddington and St., Marylebone, O. C. Summers; at Kensington, O. C. Summers; at St. Panoras, D. R. Paterson, Ltd.; at Hendon, Finchley, &c., O. C. Summers; at Camberwell, S.E., O. C. Summers; at Hammeramith, F. G. Brummell.

Manufacturing, supplying, drawing in and jointing paper-ope lead-covered cables.—London-Coichester, Siemens Bros. & Co., Ltd.; Sheffield-Donoaster, Johnson & Phillips, Ltd.

Supplying and installing two motor-generators, controlling switchboard, cable, wire, &c., at the G.P.O. (West), E.C.—Mawdsleys, Ltd.

Installing electric light at Dublin P.O.—Grindlay, Ross & Co.

Installing electric light at Dublin P.O.—Grindlay, Ross & Co.

Telephone exchange extension equipment.—At Putney, S.W., Western Electric Co., Ltd.; at Brixton, S.W., Western Electric Co.; at Sevenoaks, Western Electric Co.

Protective apparatus.—Birlish L. M. Ericsson Mfg. Co., Ltd.

Telegraphic apparatus.—Birlish L. M. Ericsson Mfg. Co.; British L. M. Ericsson Mfg. Co., Ltd.; Peel-Conner Telephone Works, Ltd.; Western Electric Co.

Submarine cable.—India-Rubber, Gutta-Percha and Telegraph Works Co., Ltd.; Siemens Bros. & Co., Ltd.; Telegraph Construction and Maintenance Co., Ltd.

Dry cells.—Siemens Bros. & Co., Ltd.

Provous cells.—Birish Insulated and Helsby Cables, Ltd.; Siemens Bros. and Co., Ltd.

Cable distribution plugs.—Siemens Bros. & Co., Ltd.

Cable distribution plugs.—Siemens Bros. & Co., Ltd.

Solder.—B.I. and Helsby Cables, Ltd.

Cable distribution plugs.—Siemens Bros. & Co., Ltd.

Jointing bronze sleeves.—Dugard Bros.

London,-Stepney.-Lest any reader should imagine that the British Central Electrical Co., Ltd., is a French concern, we are asked to state that the word "France" appearing after the name of the company, on page 51 of our issue of January 8th, was merely intended to indicate that France was the country of origin of the carbons for which it quoted.

ISLINGTON.—Last month we reported the decision of the Lighting Committee to continue the existing contracts for the supply of goods and materials to the Electricity Department for a further period of 12 months, provided the contractors concerned gave their The following firms have agreed to the Committee's consent. proposal :-

Chamberlain & Hookham.—Electrical sundries.

I.R., G.P. & Telegraph Works Co.—Ditto.

Cryselco Co.—Ditto.

B.I. & Helsby Cables —High and low-tension cables.

W. Lucy & Co.—Service and network boxes, &c., castings.

J. Gibb & Co., Ltd.—Ditto.

Dussek Bitumen Co., Ltd.—Box compound and bitumen.

British Electric Transformer Co., Ltd.—Transformers and accessories.

Dick's Asbestos Co., Ltd.—Engine room stores.

J. Gibb & Co., Ltd.—Ditto.

A. Round—Electrical sundries.

Vacuum Oil Co.—Oil and lubricants.

First Anglo-Russian Oil Co.—Ditto.

J. Knowles & Co.—Earthenware pipes, &c.

Turner & Lisney, Ltd.—Ditto.

Doulton & Co., Lpd.—Ditto.

The under-mentioned contractors are prepared to continue their contracts, subject to an increase in price :

General Electric Co.—Conduit steel and opal globes.
Heap & Johnson.—Rectifier and collector ring brushes.
Young & Sons.—Insulators, troughs, fire-bricks, &c.
Leeda Firecisy Co.—Ditto.
B.I. & Helsby Cables.—Service and network boxes.
Callender's Cable Co.—Ditto.
Johnson & Phillips.—Transformers and accessories.

. 27 8.2 5

In some cases contractors have expressed their unwillingness to continue their contracts, and the Committee proposes to purchase the goods or materials as and when required in the most favourable market. The Committee has decided to accept the offers of the spove-mentioned contractors.

Newport (Mon.).—The T.C. has accepted the tender Messrs. Babcook & Wilcox, at £150, for a steam feed water

Southampton: - The following tenders have been scepted by the Town Council :-

John Brown & Co.—48 steel tramway tires, at £15 10s. per ton. B.I. and Helsby Cables, Ltd.—Three miles of tramway trolley wire, at 8gd. per lb.

Sunderland. - The T.C. has accepted the following

S. Z. de Ferranti, Ltd.—Meters.
S. L. and Helsby Cables.—Trifurcating boxes.

Watferd.—The B. of G. has accepted the tender of Messas. Rogers & Gowlett, Ltd., for the electric light installation at the new nursery block at the workhouse, at £33.

FORTHCOMING EVENTS.

Junior Institution of Engineers.—Friday, January 22nd. At 8 p.m. At 89, Viotoria Street. Paper on "Rotary Air Pumps," by Mr. A. Arnold.

Friday, January 29th. At 8 p.m. At 89, Victoria Street. Debate on "London's Future Electricity Supply," opened by Mr. P. C.

(Sheffield and District Branch).—Friday, January 29th. At 8 p.m. At Cutier's Hall, Sheffield. Ordinary Meeting.
(Midland Section).—Saturday, January 80th. Social Evening.

fustitution of Mechanical Engineers—Friday, January 22nd. At 8 p.m.
At Biorey's Gate, S.W. Paper on "Standardisation of Pipe Flanges and
Flanged Fittings," by Mr. J. Dewrence.

Physical Society of London.—Friday, January 22nd. At 5 p.m. At Imperial College of Science, South Kensington. Paper on "Practical Harmonic Analysis," by Dr. A. Russell.

Reyal Institution of Great Britain.—Saturday, January 23rd. At 8 pm. At Athemarie Street, W. Lecture I on "Aerial Navigation—Scient fic Principles," by Dr. B. T. Glazebrook, F.B.S. January 80th. Lecture II.

Association of Mining Electrical Engineers (West of Scotland Branch).

Baturday, January 23 d. At 4.30 p.m. At Royal Technical College, Glasgow. Joint Meeting with National Association of Colliery Managers. Paper on "Electricity at the Coal Face," by Mr. J. Bowman. After the meeting several Visual Signal Indicators will be exhibited.

(Notts. and Derby Branch'.—Saturday, January 23. d. At 8.80 p.m. At University College, Notsungham. Ordinary meeting.

(Lancashire, Cheshire and North Staffordshire Branch).—
Saturday, January 30th. At 6.30 p m. At Grosvenor Hotel, Deansgate,
Manabester. Presidential Address by Mr. B. Shaw, and paper on
Prevention of Electrical Accidents in Miner," by Mr. T. J. Neison.

speciation of Engineers-in-Charge.— Saurday, January 23rd. At 5.p.m. Visit to Messra. D. Napier & sons' Works, Acton Vale, W. Saturday, January 30sh. At 7.30 p.m. At 8t. Bride's Institute, Bride Lane, S.C. Discussion on "English v. German Superiority of Business Methods."

Royal Society of Arts.—Monday, January 25th. At 8 p.m. At John Street, Adelphi, W.C. Cantor Lecture (II) on "Oile, their Production and Manufacture," by Dr. F. Mollwo Perkin.

Institution of Civil Engineers.—Tuesday, January 26th. At 8 p.m. A Great George Street, S.W. Discussion on "The Lateral Pressure an Resistance of Clay, and the Supporting Power of Clay Foundations, opened by Mr. A. L. Bell.

Wireless Society of London.—Tuesday, January 26th. At 8 p.m. At the Institution of Ek otrical Engineers Presidential address, by Mr. A. A. Campball Swinton on "Some Electrical Phenomena—Illustrated by Experiments." Members of the I.E.E. of all classes are invited to attend.

Institution of Electrical Engineers.—Thursday, January 28tb. At 8 p.m. At Victoria Embankment, W.C. Bixth Kelvin Lecture on "Lord Kelvin's Work on Gyrostatics," by Prof. A. Gray, F.R.S.

(Manchester Local Section).—Tdesday, January 29th. At 7 80 p m. At Engineers' Cmb, 17, Atbert square. Paper on "Electric Steel-Making Furnaces," by Mr. T. D. Robertson.

As University, Edmund Street. Lecture on "Kelvin's Work on Gyrostatics," by Prof. A. Gray, F.R.S. 29.

North-East Coast Institution of Engineers and Shipbuilders.—Friday, January 29th. At 7.80 pm; At nolbed Hall, Newcastle. Ordinary Meeting.

(Graduates' Section).—Saturday, January 80th. At 7.15 p.m. At Bolbee Hall. Paper on "Some Notes on Ship Resistance," by Mr. A. P. Patte son.

NOTES.

Equcational. — On Monday the Manchester Educational Authority opened a new junior day technical school for boys between the ages of 13 and 16 who desire to enter the electrical angineering, building, or allied trades. The school, which is at Newton Heath, is a new feature in local education, and about 40 students have passed the entrance examination. A second school is to be opened in Openshaw, another industrial district, at

Singular Electric Blasting Accident.—An accident unique in the history of electric blasting occurred on the Band on December 12th at the City Deep circular shaft, resulting in the deaths of two white men and two natives, and the severe injury of a third native, whilst two other natives were badly shaken. The European victims were Messrs. B. Kenny, leading sinker, and J. Lawson, his helper. They were leaving the bottom of the shaft at 6.30 a.m., after having connected up the round of heles ready for blasting, and the sinking bucket in which they were being hoisted had reached a spot about 20 ft. from the bottom when the whole round of holes went off. The force of the explosion blew the bucket and its occupants on to the platform about 50 ft. above them. In the ordinary way the men would have been hoisted to the surface, and, after the usual precautions to ascertain that all the men had left the shaft, the connected holes would have been fired by the switch on the surface. The accepted explanation of the terrible accident is that a fierce flash of lightning during a thunder-storm, which was raging at the time, struck the ropes of the skip or the guide ropes, and that these acted as a conductor connecting with the cable or the wires at the bottom of the shaft. This shaft is known as No. 3, the big circular ventilating shaft, and is now nearing completion. It may be remembered that in the discussion that took place some time ago on the subject of electric blasting on the Band the possibility of accident from this cause was pointed out.

out.—South African Mining Journal.

In a letter to the editor of the Journal, "A. J. K." says:—The defunct J. Lawson mentioned at the accident at the City Deep was (I am almost sure) a miner at Jagersfontein at the time (October, November, December, 1900,) Jagersfontein was in a state of siege. Mines were set at certain strategic points, to be blasted on emergency by electricity. The insulated wire that should have been used for the connections was not then procurable. On four separate occasions, with my own eyes I saw four of these mines separate occasions, with my own eyes I saw four of these mines exploded. The flash most probably did not strike directly on the wires, but certainly may—or did—have set up some sympathetic ourrent in the earth itself. But the flash certainly caused the explosions, J. Lawson must have known this. On the other hand, he was at the bottom of a shaft, of which the depth is not recorded. In such weather as has been obtaining of late, those wires should not have been allowed to protrude at the surface. Either they should have been stationed some 20 to 30 ft. from the surface, or the miner should have unwound them off a reel in the act of ascending—or, failing these precautions, he should have been warned from the surface that thunder conditions existed. Lawson, with his experience, would never have been killed from a cause of which he well knew the danger.

Institution and Lecture Notes. — Institution of Electrical Engineers (Yerkshire Local Section).—At the meeting on Wednesday last week, Mr. E. B. Wedmore read his paper on "Automatic Protective Switchgear for Alternating Current Systems." The discussion was closed.

paper on "Automatic Protective Switchgear for Alternating Current Systems." The discussion was closed.

Swansea and District Institute of Engineers.—A paper entitled "Invisible Light Waves" was to be read by Mr. A. L. Stanton, yesterday, in which X-ray equipments and their operation were specially treated with a view to assisting members of the medical profession.

Electrical Association of N.S.W.—The last meeting of the Electrical Association of New South Wales was held in Sydney on November 13th. The Association will in future be known as the N.S.W. Section of the Electrical Association of Australia. The annual report, referring to the licensing of wiremen, stated the N.S.W. Section of the Electrical Association of Australia. The annual report, referring to the licensing of wiremen, stated that rules had been drafted for the purpose, and it was expected that they would come into operation at the beginning of the new year. The Council placed on record the continued and valuable services given to the Association by the hon. secretary (Mr. F. W. McAlister) and the hon. treasurer (Mr. G. R. Hodson). The balance-sheet showed a credit balance of £156.

balance-sheet showed a credit balance of £156.

Mr. W. H. Myers, who has been elected first President of the N.S.W. Section, has been a strong advocate of the federation of the electrical associations throughout the Commonwealth, and the basis upon which the amalgamation was arranged was largely along the lines of the scheme put forward by him. Mr. Myers is an assistant engineer in the N.S.W. Government tramways department.

department. Mr. R. Vine Hall, mains superintendent of the Sydney City Council, has been awarded the N.S.W. Electrical Association's Rooke premium for the best paper read during the session just concluded, the subject being "Distribution of Energy by Overhead Mains."—Commonwealth Engineer.

Mr. Donald S. Munro delivered a lecture on "Modern Electrical Widelight States and the Parallel States and the

Wiring," on Saturday last, to the Scientific Society of the Royal Technical College, Edinburgh. Examples of a new method of wiring devised by Mr. Munro were exhibited.

Mr. Bernard Price has been elected President of the SOUTH AFRICAN INSTITUTE OF ELECTRICAL ENGINEERS for the year 1915 .- South African Mining Journal.

Disinfection by Electrolysis. — According to the Hospital very satisfactory results have been obtained at Bexley Mental Hospital with hypochlorite of soda produced by the electrolysis of a 4 per cent solution of common salt in water. The electrolytic tanks take 10 amperes D.C. at 220 volts, and the output is 12 gallons of hypochlorite solution per hour, which is diluted with nine times its volume of water before use in the laundry. Dr. Faulks, assistant medical superintendent, states that the solution is effective in destroying micro-organisms and removing stains, and does not injure textile fabrics appreciably.

Appointments Vacant.—Switchboard attendant (80s.) Kendal Corporation; sub-station superintendent (£200) for for Kendal Corporation; sub-station superintendent (£200) for Salford Electricity Department: sesistant for testing and calibrating mercury motor meters (during war only) for Einburgh Corporation; fitter-driver (35s.) for Severalls Asylum, Colobester; senior switchboard attendant (37s. 6d.) for Salford Electricity Department; fitter-driver (£2 2s.) and switchboard attendant (35s.) for Clacton UDC,; switchboard attendant (27s. 6d.) for Electricity Works, Lancaster. Particulars are given in our advertisement pages

Late Legal.—PNEUMATIC BELL DISPUTE.-—In the City of London Court on 19th inst., before his Honour Judge Rentoul, K.C., the London Pneumatic Tube Co. made a claim against Veritys, Ltd., for £3 16s. for making a pneumatic Ambulance bell with a 12-in. gong for them. Mr. Clark, who was the plainting and that on September 16th defendants wrote and said they wanted an ambulance bell for their Bristol house. He saw the defendants an ambulance bell for their Bristol house. He saw the defendants' manager and told him the bell would have to be specially made. Defendants' manager said they wanted the bell to act similarly to the bells attached to the City of London Police Ambulances, only those were electric, whereas the bell ordered was to be worked by the driver, their cars having no electricity. Defendants asked for an estimate, and he said it would be £3 16s. Then the defendants asked for a blue print, but he said he must design the bell, and he could not give him a blue print without it was regarded as a definite order. Defendants gave him a definite order, and later on wanted to cancel it, which he would not agree to, as he had done wanted to cancel it, which he would not agree to, as he had done half the work. He had had to pay 18s. for a gong, and he designed the striking arrangements.—Mr. Kenelm Preedy, defendants' counsel, said that their Bristol House found that their customer would not go into the matter further. They then told the plaintiffs the order must be regarded as cancelled. The firm order was subject to the approval of the blue print, and it was not approved.—Mr. Clark said there was nothing of that in the correspondence or in the conversations.—Judge Rentoul, K.C., said correspondence or in the conversations.—Judge Rentoul, K.C., said that the defendants could not play tricks with the plaintiffs as they had done. It was a provisional order, and if the defendants got the order from Bristol then the plaintiffs would get the order. It was necessary to buy a 12-in, gong.—Mr. Clark said he could not have got on without it. He bought it of Barwell's, of Birmingham. He had never seen one before, and he hoped never to see another.—Defendants called a witness, who said that the plaintiffs were told it was a provisional order. It was a new idea and they only made an inquiry of the plaintiffs. Plaintiffs reced plantifie were told it was a provisional order. It was a new idea, and they only made an inquiry of the plaintiffs. Plaintiffs need not have bought a gong: Defendants referred the metter to their Bristol House. "Blue print to be approved before proceeding," was on the order.—Mr. Clark said that was done after the firm order was given.—Judge Rentoul thought there had been a serious minunderstanding between the pretiss. He gave independ a serious misunderstanding between the parties. He gave judgment for the defendants without costs.

ATTORNEY-GENERAL AT THE RELATION OF THE IGFORD GAS Co. e. THE ILFORD URBAN DISTRICT COUNCIL.—This action, by which the plaintiffs sought declarations and injunctions in respect of alleged ultra vires acts committed by the defendants in connec-

of alleged ultra vires acts committed by the defendants in connection with their electric light supply, was settled before Mr. Justice Sargant on Wednesday, January 20th.

Mr. Mark Romer, K.C., who represented the plaintiffs, said that the defendants had agreed to submit to judgment, but they sought to impose certain terms and conditions which the plaintiffs were not prepared to accept. The action might be divided into two parts, one relating to the method by which the Council carried on its electric lighting business, and the other to preferential rates it was alleged they were giving to certain consumers. With regard to the first, the plaintiffs asked for a declaration that the plaintiffs were acting ultra vices in carrying on the business of the plaintiffs were acting ultra vires in carrying on the business of supplying electric lamps, motors and appliances, and in having a showroom for the exhibition of such goods. There was no longer any question that the Council were not entitled to carry on that business, and they did not oppose a declaration to that effect, but the plaintiff saked for an injunction to restrain them from doing any entering them from doing one restrain them from doing any acts under contracts made in connection with that business. With regard to the second part, which related to the alleged undue preference under the Electric Lighting Acts, there was no question now, having regard to a recent decision of the Court of Appeal, that the new tariff which the defendants proposed to set up was ultra rires, because they were favouring the owners of premises which were electrically lighted throughout. The defendants were willing to submit to the declaration the plaintiffs asked for; with respect to that the plaintiffs proposed merely to take the declaration with liberty to apply for an injunction if tion if necessary. With regard to the other part of the case, the defendants said that they having entered into a number of contracts for the supply of flame arc lamps, electric motors and wiring, they were willing to submit to a declaration that such matters wer tires, but they wanted the plaintiffs to agree not to apply for any injunction in respect of anything done in connection with the agreements that were in force at the present date for a period of The plaintiffs, of course, could not consent to anything of the sort. They were willing to assent to three months, but that the defendants said would not do.

His Lordship asked what was the length of these arrangements. Mr. Romer said he did not know, but there could be no question

that they were all ultra vires.

Mr. Martelli, K.C., who represented the defendants, said that some were for a year and some were for longer. He was quite willing to submit to a declaration that all these matters were altra rires, and the only question was how long his Lordship would give the defendants to make the best terms they could with those they had contracted with, some of these contracts having many

years to run, some five years and some only one year; if the Council were merely to take possession of the motors which were working under the hiring agreements, works would have to be shut down, and a number of people thrown out of employment. There might be considerable difficulty in getting back those are lamps and motors, with the less to them of several thousands of pounds and the consillers might have gurehavend; are last them of It. which the councillors might have surcharged against them. . Is was quite impossible for the users of these are lamps to make other arrangements, presumably with the Gas Co., for some little time, Mr. Romer said he could not accept the defendants' statements

as to the agreements.

Mr. Martelli said he desired to state quite frankly what the position of the Council was. They took the view that the sale of these are lamps and motors would not be carrying on a business that was ultra vires, and they intended to sell them if they could in order to out their loss.

His Lordship said that if an injunction was applied for merely because the Council had sold these lamps to a customer who had had them under a hiring agreement, he did not think he should

Mr. Martelli said that after that expression of opinion, and as no injunction was being asked for, he would leave the matter

His Lordship: Then I will make the declarations asked for, with liberty to the plaintiffs to apply for an injunction if necessary, and the defendants must pay the costs of the action.

Inquiries.—Makers of black ivoride sheets, "Comstick" dressing for commutators, and automatic staircase switches that switch off after two minutes, are asked for.

University of Hong-Kong.—Not the least remarkable suit of the European conflagration has been the demonstration of affection and loyalty which it has called forth from India and this Colony. In the remote island of Hong-Kong the local Chinese have already come forward splendidly, and, together with the British residents, have provided nearly £30,000 for the Prince of Wales's Fund. Nearly all of the British firms, with headquarters in Hong-Kong, have subscribed to the London fund direct, so that the above sum may be considered to come from the residents of the Colony, the very large majority of whom are Chinese. The University of Hong-Kong, which, as our readers know, is entirely equipped with British machinery presented by home firm, has organised a day of demonstration of apparatus, &c., and the students' Union has taken the matter up so energetically that many hundreds of visitors are expected. The charge for admission will go together with students' subscriptions, direct to the Peiron of go, together with students' subscriptions, direct to the Prince of Wales's Fand. Our readers will also be interested to know that at the outbreak of the war the whole of the members of the Engineering staff volunteered to run night shifts on the local search-lights, so as to enable some of the R.E.'s to go to the front. "Business as usual" has been carried on at the University, despite the night work at the forts.

The Electrical Industry in France.—With the issue for January 2nd our esteemed contemporary, La Lumière Elec-trique, announces that after an enforced cossation of activity due to the loss of the greater part of its staff on account of the mobili-sation, it has succeeded in reorganising its arrangements and resuming publication. Tendering our congratulations and good wishes, we add the hope that the valuable services which the journal renders to the electrical industry may never again be in-

terrupted, and that its former prosperity may soon be restored.

The course of events in the financial world since July is reviewed in a special article, and a long list is given of German and Au electrical concerns in France over whose affairs control was assumed by the Government.

Copper Famine in Sweden.-According to a wire from Gothenburg it seems that the Swedish State has very great difficulties in getting the necessary supplies of copper for various purposes, on account of the stoppage of the import of the mineral. The telegraph department has been obliged to discontinue the erec-The telegraph department has been obliged to discontinue the erection of new telegraph and telephone lines because there is a lack of cables and wires. Private industry, and the electrical industry in particular, suffers also from lack of copper, and this applies especially to the large electrical plants at Tsollhättan, where the stocks of copper seem to have been nearly exhausted. On the other hand, the United States-official returns show that the amount of copper imported from America into Sweden has enormously increased in comparison with previous weeks. creased in comparison with previous years. Of course, Sweden would not dream of selling copper to Germany, where the copper

famine is said to be even more severe. .

Guaranteed Wiring.—At the meeting of the Council of the Electrical Contractors' Association, Incorporated, held at Leeds on Friday last, the 15th inst., it was decided to adopt the Leeds on Friday last, the 15th inst. it was decided to adopt the guarantee scheme (which has been before the Association for the best part of two years) in its entirety. The scheme, which provides that the Association, as a whole, shall guarantee the wiring work of each of its members individually up to a certain specified amount, will come into force on October 1st of this year. The general indemnity, which is extended to any employer of one of the Association's members, is subject to certain limits and conditions, copies of which will shortly be obtainable from the Segretary maps application. The standard adopted will be prace-Recretary upon application. The standard adopted will be practically in accordance with the rules issued by the Institution of Electrical Engineers. It is believed that the effect of this guarantee will be very far-reaching, and that it will remove for ever, as far as the E.O.A. is concerned, the accusation that electric wiring contractors are essentially shoddy workers.

Fatalities.—HEBBURN.—An inquest was held at Hebburn on January 12th on the body of Leslie Oliver Hunt (18), an apprentice electrician, who sustained fatal injuries while following his employment at the works of Messrs. Reyrolle on 6th inst. Deceased, it was stated, received instructions to examine and report respecting an electric lift, and after setting the lift in motion put respecting an electric lift, and after setting the lift in motion put his head inside the protecting bars, with the result that a counterweight descended upon his head and crushed it. It was further stated that it was unnecessary to act as deceased had done to examine the lift, but the firm undertook, as a further protection, to construct a screen at one end of the lift. A verdict of "Accidental death" was returned.

CAMBUSLANG.—In Gateside Colliery, Peter McCourt, a miner, who was working an electrically-driven coal-cutting machine, was caught in the machinery and sustained fatal injuries.

GLASGOW.—It is reported that whilst fitting up electric wires in a warship at Fairfield Dock, on 12th inst., James Aitken, electrician, aged 44, fell backward, striking an iron guard, and was killed.

KIDSGROVE.—On 14th inst. an inquest was held into the cause of death of William Holley, aged 29 years, who died on 8th inst. as the result of an electric shock received at Birchenwood Colliery. The general manager of the colliery (Mr. Allott) said that the deceased was working as a labourer with the boiler smiths who were repairing the quenching machine on No. 1 coking plant. The machine in the deceased was been also that the local transfer of the colliery (Mr. Allott) and the colliery (Mr. Allott) are the deceased the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott) are the colliery (Mr. Allott) and the colliery (Mr. Allott) are the colliery (Mr. Allott)

ing the quenching machine on No. 1 coking plant. The machine had five fixed electric lights, 100 volts each, arranged in series, and the current was taken from one phase of the power supply (500 volts A.C.) to the motor operating the machine. Light was taken from the power circuit because the machine was a travelling one. It was understood that the lights were not to be interfered with. According to the Stafford Sentinel, Mr. Allott said that in order to provide light for the purpose of completing the repairs, current was brought from the 110 and 120-volt lighting mains 30 yd. away. The electricians fixed two lights by which the boilersmiths could see during the night. In the afternoon a fitter engaged on another part of the machine gave instructions to a vooth to fix an extension on to one of the five lights, thinking that because each lamp was at 100 volts the current was at that pressure. Later the deceased handled this particular light, and received a shock from which he died. After other evidence had been heard, the jury returned a verdict of "Accidental death."

Electricity Supply Rifle League. - As a large percentage of the members of the above League are now serving with the Army at home and abroad, the matches between the various the Army at home and abroad, the matches between the various clubs composing the League have been postponed. Information is to hand that there are new clubs formed and in process of formation in connection with electricity works, and as some of the League clubs are in a position to arrange friendly matches, such new clubs are requested to get into communication with the League searctary, Mr. E. Mathews, at 306, Mare Street, Hackney, who will be pleased to put them into communication with those clubs who are onen for fixtures. are open for fixtures.

The annual meeting and dinner have been abandoned for this

year, but should circumstances permit of a resumption of contests later in the season a meeting will be called to arrange for them.

Some of the League clubs' ranges have been hauded over to the military authorities, whilst others are doing good work in connection with local enthusiasts who are patronising the club ranges and taking advantage of the instruction offered by members of the various clubs.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their move onts.

Central Station Officials .- On January 13th at St. Central Station Unicials.—On January 13th at St. Cuthbert's Church, Sprowston, Captain G. G. Eweb, A.M.I.E.E., 7th Battalion Essex Regiment, was married to Miss Amy Lie.F., 7th Company were present at the service, and afterwards formed a guard of honour outside the church. Captain Ewer, who, in normal times, is sales engineer to the Stepney Borough Council electricity department, has been serving with his regiment on the East Coast since the outbreak of war.

The Commonwealth Engineer states that MR. E. E. STARK, who for several years past has been city electrical engineer at Dunedin, N.Z., has resigned his position. Mr. Stark originally went to New N.Z., has resigned his position. Mr. Stark originally went to New Zealand from America as engineer for the Waipori Falls power scheme, and, on the retirement of Mr. Goodman as city electrical engineer, Dunedin, to occupy his present position with the Adelaide Municipal Tramway Trust, Mr. Stark succeeded him.

The Bury Electricity Committee has advanced the salary of Mr. John Murray, chief shift engineer.

The Sunderland T.C. has granted the following increases in salary in the electricity and lighting department:—Chief assistant, from £275 to £300 per annum; works superintendent, £250 to £275 per annum; four shift engineers, £156 to £169 per annum; colerk, £91 to £97 10s., and at the end of 12 months £104.

The Salford Electricity Committee has appointed Mr. J. COLLINGE as station superintendent at his present salary.

Mr. A. Brown, chief assistant engineer at the King's Lynn municipal electricity works, has tendered his resignation, he have a second another appointment.

having secured another appointment.

Mr. W. A. Brown, distributing engineer at the St. Pangras electricity works, has resigned his appointment, and will receive a testimonial under the Borough Council's seal in respect of his 17 years' service.

MB. P. J. S. TIDDEMAN, manager of the Llanelly and District E.L. and Traction Co., Ltd., who has received a similar appoint-ment at Carlisle, has been presented by the employes with a

MR. JOHN A. PARKER, chief assistant of the Greenock electricity works, has been appointed chief assistant of the Groydon electricity works. There were 187 applicants for the position,

Tramway Officials.—Mr. ERNEST JORDAN has been appointed station engineer of the Northampton Corporation Tramways, as from December 1st last. Mr. Jordan was previously assistant engineer and formerly with Messrs. Cammell, Laird and Co., Ltd., of Sheffield.

General.—Mr. Alfred Longden, Assistant Superin-General.—Mr. Alfred Longden, Assistant Superintending Engineer of the North-Eastern District, has just retired after 45 years' service in the Post Office Engineering Department. A farewell smoker was held at Leeds recently, attended by representatives from the Engineer-in-Chief's office in London, and the principal district officers, and Mr. Longden was then presented with a clock and vases, and Mrs. Longden with a handbag. Mr. T. B. Johnson, Superintending Engineer, made the presentation.

MESSES, A. A. DIECKS, electrical engineer for Victoria in the Postmaster-General's Department, G. H. Morgan, Telephone Manager, Melbourne, and S. L. Monaghan, Assistant Telephone Manager, Sydney, who have been investigating telephone traffic requirements in America and the United Kingdom, have returned to Australia.

Australia

On Monday next at St. Paul's Church, Whitley Bay, the marriage will take place of MB. GEORGE G. L. PREECE, branch mangar in Manchester for Mesars. Bruce Peebles & Co., Ltd., to Miss May Bowie, of Newcastle-on-Tyne, fifth daughter of the late John Bowie. Mr. and Mrs. Preece will reside at Seddon Road, Hale, Cheshire. We are sure that Mr. Preece's many friends in the electrical world, including his former associates at Messrs. Glover's, at Trafford Park Tell lois with main conventions him and in at Trafford Park, will join with us in congratulating him, and in wishing him and his wife that is to be long-continued happiness.

POTUMATY.—The death has occurred at Eastney Barracks, Portsmouth, of Lance-Sergeant Frank Toon, of the Royal Marine Artillery. Some years ago deceased was apprenticed as electrician at Shirebrook Colliery. Later he enlisted in the Royal Marine Artillery. After various voyages he was appointed head electrician in the Eastney Barracks. A verdict of "Death from gas poisoning" was returned. -The death has occurred at Eastney Barracks,

NEW COMPANIES REGISTERED.

W. E. Raybould & Co., Ltd. (138 934).—This comuany was registered on January 8th, with a capital of £250 in £1 shares, to carry on the business of electric lighting, heating and telephone engineers, suppliers and fixers of electric lighting sets, petrol lighting and private telephone installations, sub-contractors for gas lighting and heating, and hot-water heating, dealers in, contractors for, and constructors of, electrical work, &c., and to adort an agreement with W. A. Raybould. The subscribers (with five shares each) are:—W. A. Raybould, Thestre Chambers, Babington Lane, Derby, incorporated insurance broker; W. E. Raybould, Jacksons Chambers, 8t, Peter's street, Derby, electrician. Private company. The number of directors is not, to be less than two or more than five; the first are W. A. Raybould (secretary), and W. E. Raybould; qualification, five shares. Registered office, Jacksons Chambers, St. Peter's Street, Derby.

Stanley Goodwin & Co., Ltd. (138,998).—This company was registered on January 14th, with a capital of £500 in £1 shares, to take over the business of mechanical and electrical engineers carried on by S. Goodwin and W. T. K-esley, at Glebe Street, Stoke-upon-Trent, as "Banley Goodwin and Keetley." The subscribers (with one share each) are:—S. Goodwin, Viotoria Square, Henley, electrical engineer; W. T. Keetley, 10, Biseley, Road, Hartshill, Stoke-upon-Trent, electrical engineer. Private company The first directors are not named; qualification, 50 shares, Bolicitor, F. Collis, Stoke-upon-Trent.

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Veritys, Ltd.—Capital, £210.000 in 7,000 5 per cent. first pref. 7,000 6 per cent. second pref. and 6,980 ord. shares of £10 each, and 200 management share; of £1 each. Return dated May 14th, 1914. 7,000 first pref.. 7,000 second pref. 6,699 ord. and 200 management shares taken up. £10 per share called up on 4,670 first pref.. 7,000 second pref. and 2,930 ord. shares and £1 per share on 80 management shares. 170 management, 2,830 first pref. and 4,900 ord. shares considered as fully paid. Mortgages and charges: £61,400. Two returns of allotments made up to June 1th and July 28th, 1914, show a further 45 ord. and 243 ord. shares allotted for cash respectively.

James Kelth & Blackman Co., Ltd.—A memorandum of satisfaction in full (a) on May 15th, 1914, of first debs. dated March 10th, 1908, securing £100, and (b) on November 25th, of second debs., dated February 9th, 1914, securing £200, has been filed.

Torquay Tramways Co., Ltd.—A memorandum of satisfaction to the extent of £200 on September 29th, and £200 on November 6th, 1914, of charge dated March 8th, 1911, securing £60,000 has been filed.

Maxim Lamp Works, Ltd.—Debenture dated January 1st, 1915, to secure £1,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Imperial United Lamp Co., Ltd., Caxton House, Westminster, S.W.

James Keith & Blackman Co., Ltd.—Issue on January 7th, 1915, of £100 1st and £850 and debentures, parts of a series of which particulars have already been filed.

Brilliant Arc Lamp and Engineering Co., Ltd.—Issue on December 22nd, 1914, of 240 debentures, part of a series of which particulars have already been filed.

Prismatic Art Sign, Ltd.—Particulars of £1,000 debs., created January 4th, 1814, filed pursuant to Sac. 93 (8) of the Companies' (Consolidation) Act, 1908, the whole amount being now issued. Property charged: The company's undertaking and property, present and future, including uncalled capital. No trustees.

Printex Accumulator Co., Ltd.—Debenture dated January 1st. to secure £500, charged on company's undertaking and property, present and future. Holder: T. B. Batchelor, Hopwood, Alvechurch, Worcester.

Musselburgh and District Electric Light and Traction Co., Ltd —A memorandum of satisfaction to the extent of £200 on December 18th and £500 on December 3tst, 1914, of charges dated November 18th, 1905, and May 11th, 1909, securing £90,000, has been filed.

City of Oxford Electric Tramway, Ltd.—A memorandum of satisfaction to the extent of £1,000 on December 21st, of charge dated February 20th, 1914, securing £46,000, has been filed.

CITY NOTES.

British Columbia Electric Railway Co., Ltd.—A dividend at the rate of 5 per cent. per annum on the 5 per cent. preferred ordinary stock for the half-year ended December 31st is to be paid.

Brazilian Traction, Light and Power Co., Ltd.—The directors have declared a dividend of 1½ per cent. on the ordinary capital.

Yorkshire (West Riding) Electric Tramways Co., Ltd.—The directors report for 1914 a net income, after providing for repairs, maintenance and debenture interest, and including £5,521 brought forward, of £32,045. A dividend of 6 per cent. on the preference shares, as against 4 per cent. for the previous year, is to be paid, placing £8,512 to depreciation renewals reserve fund, and carrying £10,725 forward.

Dublin United Tramways Co. (1896), Ltd.—After setting aside £18 000 towards renewal of rails and placing £5,000 to reserve and renewal fund, a further dividend of 2½ per cent. on the ordinary shares, making 5 per cent. for the year, is recommended; £11,366 is to be carried forward.

Montreal Light, Heat and Power Co., Ltd.—A dividend of 2½ per cent. on the paid-up capital stock, being at the rate of 10 per cent. per annum, is recommended for the quarter ended January 31st.

Anglo-American Telegraph Co., Ltd.—The directors announce a balance dividend of £1 10s. per cent. upon the ordinary consolidated stock for the year December 31st, 1914, less incometax at 1s. 9\delta. in the £; a balance dividend of £1 10s. per cent. upon the preferred stock for the year, less income-tax at 2s. 1d. in the £; a first and final dividend of £1 10s. per cent. upon the deferred stock for the year, less income-tax at 1s. 6\delta d. in the £. The above dividends, which are payable on February 1st, together with those already paid, will amount to £3 15s. per cent. on the ordinary consolidated stock, £6 per cent. on the preferred stock, and £1 10s. per cent. on the deferred stock.

Paris Compressed Air Co.—The Compagnie Parisienne de l'Air Comprimé (Popp), whose electric lighting business was transferred to the Compagnie Parisienne de Distribution d'Electricité on January 1st, 1914, now solely carries on the compressed air branch, although it holds 48,651 shares in the latter company and 6,000 shares in the supply company known as the Ouest Lumière. During the year ended on June 30th, 1914, the Popp company's revenue from electricity supply and electrical investments experienced a decrease as compared with the preceding year, whereas the compressed air department had an increase. After placing £63,000 to depreciation, the accounts show net profits amounting to £187,000, as contrasted with £207,000 in 1912-13, and it is proposed to pay a dividend of 9 per cent on the ordinary shares, as in the previous year, whilst the founder shares receive £2 4s. 9d. each.

STOCKS AND SHARES.

Tuesday Evening.

THERE can be little doubt but that the re-opening of the Stock Exchange has increased business. Whether it be that there is a sentimental value attached by the public to the fact of their brokers dealing within walls, under a roof and over a floor, or whether it is by mere coincidence, the public are certainly doing more now than they were at the end of last year. The Treasury conditions, laid upon the Stock Exchange as the price for re-opening, have not been extended to outside sources; and the quaint anomaly remains of an alien enemy being able to realise, with the utmost ease, practically what money he likes on his favourite

securities, through the medium of channels outside the Stock Exchange, although the members of the House are fettered by regulations so onerous that they extend to every investor, from the largest to the smallest.

largest to the smallest.

If a man wishes to sell 10 British Westinghouse Preference for example, he has to go through a paraphernalia of 'ceremonies, in exactly the same way as he who realises £34,000 by the sale of 1,000 Canadian Pacifics. They say that there are a few Stock Exchange men who are not above evading the temporary regulations, but it may be asserted with safety that 95 per cent. of the members are doing their best to comply loyally with rules which they are asked to maintain as a contribution to the national interest.

The electrical markets this week are featured by conspicuous firmness in Eastern and Auglo-American Telegraphs, by a further weakening in Mexican Tramway securities, and by fairly active dealings in Westinghouse Preference, Edison & Swan, and a few other manufacturing shares. Our lists show the principal movements in detail:—

Keen attention is centred upon the opening of Parliament, and the possibilities which this will present in regard to the two Bills that have been deposited in connection with London's electricity supply. The County Council Bill stands first in point of magnitude and importance. Part 2 of the Bill is that which arouses

that have been deposited in connection with London's electricity supply. The County Council Bill stands first in point of magnitude and importance. Part 2 of the Bill is that which arouse most interest in financial circles, since this proposes to empower the electricity authority to create a new trustee stock, redeemable in 60 years by a sinking fund running for the term of 30 years. The Authority, it is suggested, shall have the power to spend ten million pounds on new capital account, and such further sums as may be necessary for the acquisition of the various undertakings. Rumours that the Bill will be withdrawn met with prompt denial, so presumably it will proceed in the ordinary way, although a little scepticism on that point may be permitted.

Reference to the Bill will show that the proposed acquisition is to be carried out by agreement, which, to the ordinary lay mind, naturally suggests that the companies would demand payment on the basis of profits spread over a number of years, plus goodwill and allowance for undeveloped areas of supply. Putting the number of years, for the sake of argument, at 25—which seems to be a probable period—and making allowance for the other two items and sinking fund requirements, the observer would work out these totals to something like 22 to 25 million pounds sterling. Add the usual trimmings, and it might not be far out to prophesy that something near 40 million pounds sterling would be wanted to work this scheme. A separate Authority is, of course, an integral part of the scheme; and the Bill proposes that if this Electric Authority is satisfied that its receipts on revenue account in any year are likely to be insufficient to meet the charges payable out of revenue the Authority shall levy a deficiency rate in any year are likely to be insufficient to meet the charges payable out of revenue, the Authority shall levy a deficiency rate apportioned amongst the Councils in proportion to the assessable

value of the areas within the area of supply.

Having regard to the huge field which the scheme covers—East and West, North and South of London—this last suggestion opens and West, North and South of London—this last suggestion opens up a prospect hardly pleasing to the champions of cheap electricity supply for London, or to those undertakings in a densely-populated area which might be called upon to make up a probable deficiency, at least for some time, incurred by the authority in comparatively sparsely-peopled places in Surrey, Middlesex, Bucks, and Hertford. It might be supposed that the companies would cordially support a scheme whereby they should be paid out on goodwill terms in a trustee stock that would have a first charge upon the revenue of the new authority; but from the point of view of the outsider, interested more as a consumer and ratepayer than as a holder of electricity supply shares, the outlook is less alluring.

The companies—or at least some of them—do not wish to be disturbed, however; and several are promoting a Bill of their own, conceived, as we said before, on more modest lines, but lacking the adhesion of various important members of the London electrical

adhesion of various important members of the London electrical undertakers, without whom it would be practically impossible to attain the great desiderata of central supply and cheap current which Parliament will certainly demand as a condition of autho-

rising any such amalgamation plan.

We must repeat once more that, with the Government a large borrower on war account, any proposals that call for the raising borrower on war account, any proposals that call for the raising of substantial sums of money are bound to be regarded coldly just now, more especially if they involved such competition as the creation of another trustee security would necessitate. The Treasury has intimated this week that issues for undertakings carried on, or to be carried on in the United Kingdom, shall only be allowed where it is shown to the satisfaction of the Treasury that they are advisable in the national interest, so that the prospects for either Bill look none too rosy at the moment.

It is no part of ours of course, to fling hyper-austere criticism.

It is no part of ours, of course, to fling hyper-austere criticism at schemes that aim at the achievement of such an object as unification of London's electric supply. But, in this part of the ELECTRICAL REVIEW at all events, it is fluance that counts mostly; ELECTRICAL REVIEW at all events, it is finance that counts mostly; and therefore one is bound to examine with a good deal of closeness each proposition as it is brought forward. The critic welcomes each honest scheme, though it may seem unsound in parts, since all these proposals are working towards the goal which must one day be reached. The sooner the end is attained, the better will it be for everybody; but to build upon insecure foundations would simply mean the work having to be done over again, unless London is to be saddled with a burden more heavy and costly than prevails at present, and the great conclusion of cheap lighting and power be defeated through indiscreet action at the outset.

outset.

The prices of Home R ilway stocks again show advances in most cases on the week. This time the improvement has spread to the electrical issues. Underground income bonds are 1½ up at 81½, and the 4½ par cents, are better at 98½. The company's 6 per cent. 1st cumulative income Debenture stock stands at 112, which is within a couple of points of the mean price at the end of July. Metropolitans have hardened, and Districts rose ½. There is more business passing in the pre-Ordinary securities. Metropolitan 3½ per cent. Preference changed hands at 76½, District Firsts at 76.

Eastern Telegraph Ordinary stock has risen 6 points, fairly rapid justification for our contention last month that the stock was undervalued at 118, seeing that now it stands at 128. Eastern Extensions move more slowly, and have fallen behind the Eastern stock. The Telegraph market as a whole is very firm. Westerns

stock. The Telegraph market as a whole is very firm. Westerns are better, and both classes of Anglo-American Telegraphs responded to the declaration of the usual dividends, making 6 per responded to the decisration of the usual dividends, making 6 per cent. on the Preferred, 3 per cent. on the Ordinary, and 1½ per cent. on the Deferred, for the past year. New York Telephone bonds are good; and of the outside shares, Marsonis once more gained a small fraction. American Marconis dropped a trifle to 92. 9d.

The Treasury's restrictions with regard to new issues, already quoted earlier in this article, are welcomed by investment markets

in the Stock Exchange, on the assumption that removal of the possibility of such competition as new issues afford will have a strengthening effect upon existing securities. Incidentally, it may be remarked that the Treasury's solicitude to husband home resources is interpreted in some quarters as a quiet hint that there may be another War Loan bifore long. The recent issue was supposed to provide the sinews of war up to the end of July, but the City looks for further borrowing about May.

Manufacturing shares are generally strong. British Westing-house Preference have been done at 40s. Henleys are 10s. up at 13\frac{1}{2}. Another section of noticeable strength is that for Armament shares. Armstrongs have risen from 39s. to 42s. Vickers are better, and lively dealings have sprung up in the shares of the Projectile Company. Castner-Kellners have risen to a little over 3. The Rubber market keeps fairly firm, with a good deal of trade being done in the popular shares.

MARKET QUOTATIONS.

OWING to the war, the prices given below are, of course, more or less nominal.

THE NATIONAL ELECTRICAL CODE AND BRITISH WIRING RULES COMPARED.

BY FRANK BROADBENT.

In a recent number of the New York Electrical Review and Western Electrician a comparison is made between the wiring rules in vogue in the United States, in Germany and in England. American rules are those known as the National Electrical Code, which is revised every two years, and it is no doubt because the time for the next revision is approaching that this detailed comparison has been made. The rules set out in three parallel columns occupy about eight complete pages of the paper, although the comparison covers only the rules for erection in interiors and does not touch other branches of wiring work or the details of materials.

Generally speaking the National Code appears to be much too detailed, and it is possibly this fact which When rules made such frequent revision necessary. When rules such as those of the Home Office and Institution of Electrical Engineers are drawn up to cover general principles rather than details of manufacture such frequent revision is not necessary, because so long as any new piece of apparatus complies with the general regulations laid down there is no need to modify the rules in order to bring it within their scope.

Take, for instance, the question of fuses or cutouts: the Home Office Regulation No. 5, consisting of about 80 words, covers not only fuses, but circuit breakers also, and deals with the subject fully from the point of view of danger to work-

In the Institution Rules the whole of the references to fuses, as regards their mode of installation or position in the circuit in which they are to be placed, are contained in about 200 words scattered over many pages, because they appear under several headings, involving a certain amount of re-petition. The conditions to be fulfilled by fuses from the point of view of fire hazard are covered by about 320 words, the references covering things as the prevention of risk to the installation or the apparatus protected, and of the overheating of the fuse itself.

Now when we turn to the National Code we find that something like 400 words are devoted to the method of installing, or the positions in which fuses are to be placed, and in addition there are over 2,000 words of descriptive matter referring to details of construction.

Notwithstanding the considerable amount of space devoted to details, the Code specifically states that these " are but a partial outline of requirements. Devices or materials which fulfil the conditions of these requirements and no more, will not necessarily be acceptable. All fittings and materials should be submitted for examination and test before being introduced for use." From this it might appear that any new or improved device might be condemned by an inspector of the National Board of Underwriters on the ground that it had not been officially passed, even although it might comply with the regulations and be more suitable to its purpose than previously existing types which had satisfactorily passed the test.

"Link" fuses, that is to say bare wire fuses, are approved under certain conditions by the National Code. They must not be mounted on porcelain bases but on slate or marble, and must be enclosed in a cabinet box (equivalent to our distribution fuse box) which itself must be made in accordance with regulations which specify the minimum thickness of the metal to be used, the space between the door and the fuses, and between any part of the metal case and live metal, the thickness of the insulating linings, the thickness of the glass panels, the mode of constructing the doors and

so on; and the cabinet must be plainly marked with the manufacturer's name. There are many distribution boxes of approved make in this country which would not comply with the requirements here laid down, and practically all our link fuses are carried

on porcelain bases or supports.

Another rule with which British practice does not comply is that wooden or composition cabinets "must not be used on metal conduit, armoured cable, or metal moulding systems." Hard wood distribution boxes, suitably lined with fireproof material and provided with metal plates or other means of bonding the conduits together, are very commonly used for interior wiring when the conductors are run in conduit. In some respects they are safer than metal boxes.

The requirements of the National Code as to the placing of fuses in the neutral wire of a three-wire system do not conform to English practice. According to our Institution Rules "no fuse may be placed in the neutral conductor of a multiple wire system, but fuses must be placed on both conductors of two-wire circuits branching therefrom."
According to the National Code fuses, under some conditions, must be placed in the middle or neutral wire, but may be omitted "provided the neutral wire is of equal carrying capacity to the larger of the outside wires, is earthed"; and when the fuse is omitted, branch circuits must be run as twowire circuits and protected by fuses on both poles. From this it would appear that when a fuse is placed in the neutral conductor no fuse need be connected in the wires branching from the middle conductor. The reason for this regulation is not at all clear, because if a fuse in the middle wire of an unbalanced system failed, the lamps or motors on one side would receive an abnormal pressure without necessarily blowing the fuse of the branch conductors.

Another point in which the National Code differs from British practice is in regard to fused rosettes or ceiling roses. It appears that "on open work in large mills approved link fused rosettes may be used at a voltage of not over 125, and approved enclosed fused rosettes at a voltage of not over 250, the fuse in the rosette not to exceed 3 amperes." Not only is this against British practice, but it was due largely to the danger arising from fused ceiling roses in textile factories that the practice was originally disapproved, whereas it is precisely in this class of work that it is approved in America. Further, the dangers arising from the scattering of molten metal are greater on the lower than on the higher pressure, owing to the greater mass of metal employed in the fuse, yet bare fuse wires are permitted on the lower voltages.

The plain link fuse with fixed screw terminals is practically obsolete in this country for interior wiring, some form of bridge or fuse carrier being invariably used, and whilst our own being invariably used, and whilst our own rules specifically mention that enclosed fuses are preferred there are many types of bridge in which the fuse metal is exposed. These however are gradually going out of the contract of the contrac are gradually going out of use owing to the fact that they are not in line with the Home Office regulations. The Home Office regulations do not of course apply to ordinary domestic installations, but manufacturers who make fuses to comply therewith, and contractors who carry out both factory and domestic wiring, naturally aim at some kind of uniformity, so that as the Home Office insist upon enclosed fuses, and the Institution Rules express a preference for them, the tendency is all in the direction of the enclosed or protected type.

Another point which will strike British contractors as a somewhat curious one is the fact that on motor circuits where overload circuit breakers are used, fuses must be employed in addition, although single phase motors may have a circuit breaker on one pole and an approved fuse on the other. This rule applies to all circuits where the current is not too great for an approved enclosed fuse. Without further explanation one can only assume that American circuit breakers of comparatively small carrying capacity have not proved themselves to be satisfactory. We have heard of large circuit breakers on railway switchboards welding up solid due to a sudden and abnormal overload and so preventing their breaking circuit, but have never heard of this in connection with comparatively small circuit breakers.

Manufacturers who have hopes of developing export trade to America and Canada will be more interested in the details of manufacture than in the methods of installing the apparatus. As mentioned above, the rules dealing with construction are far more lengthy and more detailed than those dealing with the mode of installing, and in the 2,000 odd words we have rules dealing with the depth of countersinking for screw heads, the melting point of the waterproof composition which covers such screw heads, the number of screws to be used to support fuse bases, the diameter of ferrules, the thickness, width and length of contact blades, and diameter and length of the cartridge tubes; and, in addition to the descriptive matter, there are two pages of dimensions of cartridge fuses, which appear to be the most approved type. In fact an pear to be the most approved type. In fact an explanatory note lays it down that "the enclosed or cartridge type of fuse cannot be improperly used for higher currents than those for which they are designed." This is distinctly against all experience with cartridge fuses, as not only is it possible to fit a larger fuse-wire in a cartridge than that originally fitted, but it is difficult, and in some cases impossible, to tell by inspection what size of fuse-wire has actually been fitted. In this connection the open type fuse has the advantage, and possibly this is its only advantage. Not only can a cartridge fuse be abused in this way by installation attendants, but it is not uncommon for manufacturers themselves who have run short of stock of a particular size of fuse wire to substitute a larger fuse than that for which the cartridge is stamped, and simply alter the marking. So far as our experience goes there is no fuse on the market, not even the most modern screw plug fuses, which cannot be tampered with, as even these can be short-circuited or by-passed across the terminals with a fuse wire of practically any size. This in fact is what is generally done when such a fuse blows and there is a shortage of refills.

Turning now to the requirements in relation to switches, the Home Office Regulations Nos. 3 and 4 deal in less than 150 words with the question of safety to persons employed on the premises where switches are employed, and also to those actually using the switches. They define generally the position in which switches are to be placed and the principles of construction. The Institution Rules in about 250 words cover the method of installation of switches, and their position and function, and give sufficient general guidance on details of construction to cover the questions of overheating, arcing and

protection to users.

The National Code on the other hand, after occupying about three times the space with rules as to the installation and use of switches, contains seven pages, or about 2,000 words dealing with specific details of manufacture. This does not include motor starting switches, to which another six pages are devoted. One cannot, of course, judge as to the comparative merits of a set of rules drawn up to meet similar needs by a comparison of their prolixity, but it will be agreed that conciseness when coupled with clarity of expression is very desirable in a code of rules intended primarily for the guidance of the contractor and wireman, and moreover, the nature of the details specified produces the impression that they have been drawn up rather to suit some particular make of approved switch than to

ensure compliance with general conditions based

on a definite and scientific plan.

In some respects the National Code is more definite than our Institution Rules, e.g., the rule relating to the installation and function of the main switch. Our rules require that the main switch on an installation fed from a public supply shall be easily accessible and placed as near the entry of supply as possible. They do not state that it shall cut off pressure from all apparatus, and it is common practice for supply authorities to fix their main fuses and meters on the live or supply side of the switch, so that they are always alive whether the main switch is on or off. In the National Code the rule is quite definite on this point, viz., " service cut-out and switch must be arranged to cut off current from all devices including meters." Instances have come under notice in this country of clock meters having been inadvertently connected on the consumer's side of the main switch, with the result that after being switched off they do not restart, and unregistered units have been consumed. This may be the principal reason for connecting meters generally on the supply side of the switch.

Among the considerable details of switch construction given in "Class D" of the code, it is specified that nothing but slate, marble or porcelain may be used for knife switch bases unless any other material proposed is first submitted for special The number of supporting screws examination. must not be less than four if the area of the base is over 25 sq. in. Such screws between parts of opposite polarity must be countersunk and there must be at least ½ in. surface distance between the head of any supporting screw or washer and any live metal. Contact jaw mountings must be secured by at least two screws or some equivalent to prevent turning, and nuts or screw heads on the underside must be countersunk not less than $\frac{1}{8}$ in. and covered with waterproof compound which will not melt below 150 degrees F. This refers to the base Then there are regulations and restrictions as to the hinges of the contact blades, the blades themselves, the cross bars and connections. Thus the contact area of the blades must be the equivalent of 1 sq. in. of pure copper per 75 amperes, and the section of metal must be proportioned for a rise not exceeding 50 degrees F. The electrical test specified is quite moderate, viz., a "50 per cent. overload in amperes and 25 per cent. excess voltages" under the most covers under the most severe practical conditions. It may be assumed from this that the excess current and voltage are to be simultaneously applied and that the circuit may be inductive.

The foregoing requirements appear to apply to "knife" switches of any size and type, and for any voltage up to 550; so the ordinary tumbler switch or any other pattern which has not a quick make and break would come under this designation. Very few, if any, tumbler switches, which are as rare in the States as "snap" switches are in this country, would meet the requirements.

Another point of interest to manufacturers is that all switches must be plainly and visibly marked with the name of the maker, and the rated current and voltage; and service switches must indicate whether the current be "on" or "off." It would be interesting to know if in the case of a "push-and-pull" switch the position of the knob or handle is accepted as a sufficient indication.

(To be continued.)

Portable X-Ray Apparatus.—The French Red Cross, 25, Knight-bridge, W., is badly in want of ten specially constructed cars equipped with X-ray apparatus, dark room, &c., for use immediately behind the firing line. Such cars cost, completely fitted out, about £800 each.

THE CASE FOR THE ELECTRIFICATION OF FLOUR MILLS.

By Ernest P. Hollis, A.M.I.E.E., A.Am.I.E.E.

Flour mill electrification is a problem which has not yet ceased to exercise the mind of the engineer charged with the erection and operation of flour mills. Quite recently the question was debated before the Institution of Mechanical Engineers, and a perusal of the observations then made demonstrates that on many fundamental points the flour mill engineer fails to appreciate the benefits that accrue from the electric drive. As in many industries, the question of electrification as appreciated by the miller turns practically wholly on the cost per b.h.p.hour at the engine, and if the steam or gas engine maker can convince the miller that the cost per b.h.p.-hour at the engine is less than if the engine were replaced by one motor—for, be it noted that the miller is persuaded that there is little scope for the individual drive—then he considers the case against electrification to be made out.

It is one purpose of this article to traverse many of the statements made against the electrification of flour mills in the hope that they will provide material for an attack upon the rooted convictions against electrification which are largely held by

millers.

The Consumers' Engineer in his campaigns is often placed in the difficult position of being unacquainted with many of the processes to which he hopes to introduce electrification. The engineer who goes to talk electrification to a cement works engineer is soon placed in difficulties when the cement works engineer asks "How would you drive the cylpebs? Would you drive them from the same motor as the kominor?" Or if he interviews a flour mill engineer who enquires after the driving of plansifters or cockle extractors, it is not a hopeful augury of success to acknowledge ignor-It is hoped therefore to afford Consumers' Engineers unacquainted with flour milling the necessary outline of milling to enable them to talk confidently to the miller; and also to acquaint him with the points he is to drive home, the arguments he is likely to meet and how he may controvert them. On the ability to undertake this the success of his mission depends.

First let a brief conspectus of the treatment of the grain be given. Flour milling divides itself into four different processes:—(a) grain handling; (b)wheat preparing; (c) flour milling; (d) packing and storing the finished products. The processes are automatic and eliminate labour to a very large extent, and this fact, coupled with the heavy capital cost of the machinery, is responsible for the long running hours of the mill. Often a mill operates continuously 144 hours a week, and in busy times

the whole week through.

Although the plant is sub-divided in the manner which has been mentioned, the grain passes automatically from one portion to the other without human intervention, and this fact plays a prominent part, as will be discussed later, in the electrification question.

The four main processes enumerated can be again sub-divided as follows:-

(a) Grain handling plant:-

- 1. Wheat intake from the boats or trucks.
- 2. Weighing and preliminary cleaning plant.
- 3. Storage silos.
- 4. Mixing and conveying plant, passing on to process (b).

(b) Wheat cleaning plant:—

1. Dry cleaning plant.

- 2. Washing, drying and conditioning plant.
- 3. Storage bins for conditioning the wheat
- passing on to process (c).
 (c) Flour manufacturing or rolling mill plant:—
 - 1. Granulating or breaking down process 2. Scalping and grading.

3. Purification.

4. Reducing purified stock to flour.

5. Flour dressing, the flour passing on to process (d).

(d) Sacking off, warehousing and storing the finished products.

Grain handling plant.—The grain is elevated by bucket elevators from the quay side and delivered to a travelling band fed at different points by various It passes first to the preliminary legs. cleaning plant, consisting of an automatic weigher registering the number of tips, next through the separator composed of oscillating riddles. While the grain is being riddled powerful air currents remove light chaff and dust. It is then elevated to the silo house or wheat store by travelling bands. These silos are usually large concrete receptacles holding many thousands of tons of wheat. drawn from the silo for treatment the wheat is fed by bands and elevators into a set of storage bins usually located in the wheat cleaning section. to this point different kinds of wheat have been separately stored, but they are blended here in definite proportions. The product then passes on to the wheat preparing plant.

Wheat preparing plant.—Here the berries are treated to remove both smaller and larger impurities; they are rubbed for loosening dirt, scrubbed with stiff brushes, subjected at a number of points to the action of wind currents to carry off the loosened

light floating dust.

The next stage is the removal of the small cockle seeds from the wheat by "cockle cylinders." These are composed of rotating cylinders with pitted in-ternal peripheries. The machine relies for its operation upon the difference in shape of the cockle and the wheat, the former being round and the latter oval. When the cylinder rotates the oval grains drop out of the pits first while the spherical ones stay longer, eventually falling on a hopper which separates them from the wheat. They are collected at the bottom of the hopper and removed by a worm They are not wasted but are used for conveyor. cattle food.

An alternative to the cockle cylinder is an extracting band similar in principle and composed of travelling plates given a rapid cross shake. These plates are pitted with holes which hold the cockle seeds which are collected in a similar manner to that previously described.

Wheat Washing -The wheat is next washed for cleansing and for softening the harder varieties. It is fed on to a washing worm and floats on the surface of the water, the stones remaining in the worm, which is submerged. The flow of water carries the wheat along, and it is drained in a centrifugal

machine. Conditioning Plant .-- In the conditioning plant the wheat undergoes a warming process which sweats out the superfluous moisture from the inside of the berry. This moisture is removed by warm and cold currents of air. The wheat is then passed to the conditioning bins where it is stored for a period, after which it is ready for the rolling process.

Rolling Plant.—In the rolling process the berry is broken down and the kernel extracted. The breaking down is done in roller mills, there being about four stages in which it passes through fluted rolls of various coarsenesses. It is worthy of note that no attempt is made here to produce flour which is the outcome of a final rolling later in the process.

The next process is the scalping when the husk is separated from the kernel. As the wheat emerges from the rolling mills into a hopper it is subjected to a light suction from a fan, with the result that the lighter particles are drawn to one side, while the heavier, composed of high class semolina, being less affected by the air suction fall into a different hopper. The heavier particles then pass on to the semolina duster in which they fall through an inclined sieve and the lighter ones are again separated. Again the product drops into a purifier where it is subjected to further air currents and the lighter particles again drawn off. From the purifier the stock passes to the reduction rolls in which it is finally ground. It is then termed "flour." Lastly it goes to the flour dressing machine. Here the flour is reduced to an extremely small size either in a "plansifter" composed of sieves in motion and scraped by brushes, or in a centrifugal machine.

After leaving the dressing process the flour is fed into sacks by means of conveyors, and the dust and other products are disposed of in a similar way. The packing room is usually in the upper floor of the warehouse and the sacks are dropped through sack chutes, or in some other way brought to the ground level.

Grinding.—Another department is the grinding house in which a number of grinding stones are used for the production of wholemeal and the reduction

of certain of the by-products to make animal food.

The case for electrification.—The case for the electrification of flour mills is rarely understood by millers. They are obsessed by two assertions which have been urged upon them as militating against the necessity for electrification. These assertions

1. The plant runs as a complete unit from the time it is started until the time it is shut down. Individual drive on which the case for electrification in many industries turns is here, they have been told, useless.

2. The plant is usually driven from a central point, and it is therefore unnecessary to incur the losses due to the change of energy from steam to electrical and its re-conversion to mechanical

power.

These specious arguments appeal strongly to the the uninitiated, and it requires a close knowledge of flour milling to be able to convince the miller. Perhaps in the first place it is of interest to know that electricity is called in to assist the miller in practically every installation, for two purposes:—

1. For the lighting of the mill. The explosive

nature of the flour dust which permeates the atmosphere absolutely precludes in some of the depart-

ments an open light such as gas.

2. In practically every case the outlying drives such as elevators for the wheat intake plant must be driven electrically, and only in a few instances

can the rope drive be applied.

When therefore the miller talks of electrification he usually is referring to what may be called the mill proper, and he requires no convincing of the advantages of electricity for lighting and for the out-

lying drives.

Coming first to the question of individual drive, when it is said that there is no scope for an individual drive the best answer is to show the doubter an electrically driven mill. There he will find much to his surprise that there is scope for the individual drive, and that motors are dotted all over the place as one would find them in an ordinary engineering works. Perhaps he cannot understand it, but it must be pointed out to him that the reason why he did not see the necessity for individual drive was because in the steam driven mills, to which he has been used, the designer has been compelled to arrange the machinery in order to meet the exigencies of the drive. The designer has not been free to put his plant where he liked, and has therefore been

forced to go in for inconvenient arrangements which conflict with his discretion. In the electrically driven mill the designer puts the plant just where he pleases and is not dictated to by the position of the line shafting. Secondly, there comes the question of efficiency. The miller cannot see that the electric drive is efficient because of the double conversion. The answer is that the losses in converting and reconverting the electrical energy are in most mills less than those incurred in a steam driven mill: Where the line shafting is kept in first-class order and is thoroughly well tended, and where the arrangement of the mill prevents any irregularities in the arrangement of the shafting, it is possible that the electric drive might be at some small disadvantage. But few line shaftings attain the degree of perfection which is disclosed by those on which published tests are taken, and when one comes to examine the matter it is usually found that while the difference in many cases may be only slight it is rarely against electricity.

There is one advantage of electrification which is understood by millers and that is the constancy of speed. A number of operations in the mill depend upon delicately adjusted air currents. If the air curcurrents vary in strength, the desired separations are not effected, and a deterioration in the quality of the product follows. This advantage is generally ac-

knowledged.

Further, there are some important general advantages of electrification which do not occur to the miller and which it is well to impress upon him. First, there is the increased output of the mill. Due to the constancy of speed, the output of an electrically-driven mill is greater than that of the steamdriven mill. This fact is vouched for by so eminent and unbiased an authority as Mr. C. J. Robinson (Proceedings of the Mechanical Engineers, 1913, page 1036) who says:-

"It had been proved, for instance, that an electrically-driven mill could be relied on to increase the output not less than $7\frac{1}{2}$ per cent over the same mill

driven by steam power.

This increase of production is an experience common to many industries where the electric drive is introduced, as, for instance, textile mills and rolling In addition, the speed uniformity ensures evenness in the grinding and dressing processes. which tends to a higher class of product. the experience of electrically-driven flour mills.

With the electric drive an important advantage is gained by virtue of the ease with which electrical power can be measured. When a prominent manufacturer of flour machinery recently undertook to analyse the power required to drive a flour mill—the re ults of his investigation form the basis of a paper read at a recent convention of the National Association of British and Irish Millers—how did he make his measurements? There was no other convenient way than by means of an electric motor. Now, it is well-known that in flour mills a great loss of power can be unknowingly incurred. It has, for instance, been found that fluted rolls, as used in the breakingdown mills, when they become dull incur a considerable loss of power. How is the flour miller to detect it in a steam-driven mill? He can only do it by keeping an eye on the ammeter of an electric motor. The same applies to the mill stones, and it will be found, generally speaking, that the miller can effect considerable economies in the power taken without deteriorating the quality of the product or diminishing the output of the mill.

The elimination of long lengths of shafting naturally diminishes the amount of noise made in the mill. This, however, in milling work is no very great advantage, owing to the small number of the employés. The reduction in the length of belting, however, is

a material advantage for obvious reasons.
In conclusion, the Consumers' Engineer has a number of examples of electrification of flour-mills to which he can point as exemplifying the advantages of the electric drive, and it can be safely said that, if any doubting miller is referred to any of these mills for information, he will receive a satisfactory testimonial which should remove any doubts

he entertains on the question.
When Consumers' Engineers have the opportunity of quoting an outside power supply for flour mills it is desirable that they should remember the extraordinary good load factor, and they would do well also to bear in mind that responsible authorities have told the flour millers that in order to make electrification pay it must be supplied at a cost of 0.4d. per kw.-hour or under. This dogmatic assertion is not accepted by electrical engineers, but the figure is well worth keeping in mind in order that they may not kill business by quoting an impossible price.

CAB SIGNALS ON BRITISH RAILWAYS.

(Abstracts of Papers read before the Institution of Mechanical Engineers, December 18th, 1914.)

Electrical Cab-Signalling.

By VINCENT L. RAVEN, CHIEF MECHANICAL ENGINEER, NORTH EASTERN RAILWAY.

This system, designed by the author, has been in actual use on the Richmond branch of the North Eastern Railway for over two years, and also on that part of the North Eastern Railway's Co.'s main line which is situated between Durham and Bensham, and during the whole of that time the arrangement has given every satisfaction; and on no occasion has the danger signal ever been omitted to be given. The apparatus is fitted to thirty-eix locomotives.

The main objects of the system are:—

1. To advise the driver of his approach to a signalling zone where signals are to be looked for.

and the small pointer, by the number indicated, also gives the "route" indication. The AUDIBLE INDICATOR is an electric bell, which is separate from the visual apparatus.

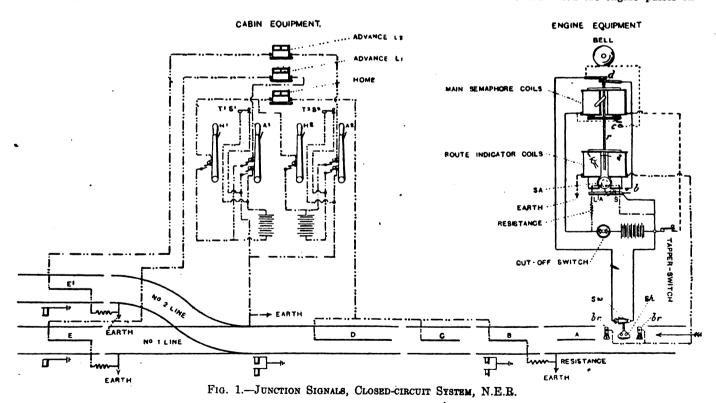

The engine circuits are brought into operation by the movement given to a metallic shoe linked to a small switch when passing over insulated metallic bars placed in suitable positions on the track, and currents are collected from the bars by insulated steel wire brushes brushing lightly but firmly over the bars as the engine passes over them.

The semaphore and bell are directly operated by a battery carried on the engine. The "route indicators" are directly operated by currents established by the signalman in the operation of the ordinary levers of the stor line signals. These currents also indirectly operate the semaphore and bell.

Fig. 1 is a diagram showing the complete cabin equipment for a two-way diverging junction, together with the circuits on an engine approaching the junction. Sh is the shoe, and Sw the switch controlling the engine circuits, and br are two insulated steel wire brushes, which pick up current from the cabin batteries under certain conditions, by contact with the bars B, C, D, E, and E, all of which are connected with the cabin equipment by line wires. The bar A is not connected with the cabin equipment by line wires. The bar A is not connected with the cabin equipment is travelling in the direction shown by the arrow, when the shoe, Sh, passes on to the bar A, the semaphore arm will immediately rise to the Danoer position, and the "route indicator" pointer takes up the central position between the Nos. 1 and 2. The bell will begin to ring as soon as the shoe, Sh, has passed over the bar. These indications continue until the engine arrives at the bar B.

If the line signals are at Danoer arm remains at Danoer. The brushes, br, br, run over bar B at the same time as the shoe, Sh, but as bar B is not energised when the line signals are at Danoer they have no effect. As soon as the shoe, Sh, is clear of the bar, the se

Suppose, now, that the HOME and ADVANCE line signals for No. I line are lowered for the train to go forward. The small semaphore arm is lowered to OFF and the "route indicator" pointer is deflected to No. 1 on the indicator, and remains there. These indications remain when the engine passes off

2. To give the driver the necessary information with regard to the position of the signals controlling his further advance, and to prevent him from mistaking other signals than his

3. To retain control of the driver by the cab-signals until he has passed the last signal-controlling entrance into the section ahead.

The system comprises VISUAL and AUDIBLE indicators, and the appearatus is electrically operated. The VISUAL INDICATORS on the engine consist of a small semaphore, and one or two pointers capable of being deflected to indicate numbers painted on the dial. The semaphore arm, together with the operation of the small pointer, indicates "condition" signals,

bar-D, whilst passing over bar E, and until it arrives at the bar A of the next signalling point.

Suppose that the signalman had desired to draw the train forward to ADVANCE No. 1 instead of sending it right away. The engine is standing with the brushes br, br, and the shoe, Sh, on bar D. The signalman lowers the HOME signal and then taps the small switch Ti Si several times. This has the effect of lowering and raising the small semaphore arm on the engine and calls the driver's attention and gives him to understand that he is only being drawn forward to the ADVANCE. It is thus a cautionary signal entirely distinct from the OFF signal just described. The small semaphore remains at DANGER, and when the engine moves off the bar D, the bell recom-

mences to ring. These indications continue until the engine

comes to a stand on bar E.

comes to a stand on bar E.

Suppose, now, it is desired to dispatch the engine standing at No. 1 advance line signal. The small semaphore arm is at DANGER and the bell is silent. The signalman lowers the advance signal No. 1 by the lever A¹ in the cabin, and the small semaphore arm on the engine is immediately lowered to off, and the "route indicator" pointer deflected to 1 on the dial of the indicator. As described before, these indications remain until the engine arrives at the bar A of the next signalling section.

Assume, now, that the HOME and ADVANCE signals for No. 1

Assume, now, that the HOME and ADVANCE signals for No. 1 line have been lowered before the engine arrives at bar A. On passing over A, the small semaphore arm on the engine rises to the DANGER position, the "route indicator" pointer takes up the central position and the bell begins to ring, and these indications continue until the engine arrives at bar B. Whilet passing over B. the small company arm is lowered. Whilst passing over B, the small semaphore arm is lowered to off, the "route indicator" pointer is deflected to No. 1 on the dial of the indicator, and the bell then ceases to ring. These indications are continued whilst the engine is passing over the subsequent bars C, D, E, and until it arrives at the bar A of the next signalling section. This constitutes the off

Assume, now, that the engine, on passing over B, has obtained the OFF signal as just described, and that an emergency arises which renders it necessary to stop the engine, at the HOME signals if possible. Under ordinary circumstances, the signalman would throw his HOME and ADVANCE line signals to DANGER immediately. This action on his part, with the line signals, ensures a DANGER signal being given either at bar C, or D, or E, according to the position of the engine when the line signals are put to DANGER.

Finally, assume that the engine has passed over a bar B with the line signals at DANGER, and before it has reached bar C the signalman has lowered the line signals. The small semaphore arm is at DANGER and the "route indicator" pointer in the central position and the bell ringing. On passing over bar C, the complete OFF signal will be obtained, that

pointer in the central position and the bell ringing. On passing over bar C, the complete off signal will be obtained, that is, the semaphore arm will be lowered, the "route indicator" pointer deflected to No. 1 or No. 2 on the dial of the indicator, as the case may be, and the bell stopped precisely as in the case where the off signal was assumed to be obtained at bar B.

It will be seen that the action of the bar A upon the engine circuits constitutes a signal warning the driver of his approach to a signalling point. The continuance of the WARNING signal constitutes a DANGER "condition" relating to the stop signals for the signalling point which is being approached. The bar A is situated at a distance of about 150 yards from the bar B, and the WARNING signal is, therefore, of short duration only if the stop signals are off. The stopping of the WARNING signal by the return of the small semaphore arm to the off position, the stopping of the bell, and the receipt of a "route indication," constitute the off signal, which can only be given when all the main line signals are off, and then only by the direct intention of the signalman. An indication given at the first signalling bar B can be reversed during the passage of the train from B over the subsequent bars to the ADVANCE signal. The number of points at which these reversals can be obtained is only limited by the number of intermediate bars C. The apparatus is capable of giving CALLINGON signals as well as the off and on. Currents are sent to the bars by the operation of switches connected and working with the levers operating the stop signals, HOME and ADVANCE, and the signalman can, therefore, only give the off indications by intention.

As already indicated, the bars A B C D E etc. act It will be seen that the action of the bar A upon the engine by intention.

the signalman can, therefore, only give the OFF indications by intention.

As already indicated, the bars A. B, C. D, E, etc., act mechanically on the shoe Sh, to actuate the semaphore and bell, and electrically, by currents set in operation by the signalman, through the brushes br, br, to actuate the "route indicator" and indirectly the semaphore and bell. The opening of the switch, Sw, causes the armature of the main semaphore coil to be released, raising the arm to danger, and mechanically releasing the "route indicator" pointer from its deflected position. At the same time the contact c is made, and contact d broken. These alterations of the contacts, c and d, divert the current through the bell as soon as the switch Sw is closed by the shoe Sh passing off the bar A. The armature of the main semaphore coil cannot be raised by the closing of Sw, because the circuit is now broken at d. Hence the bell continues to ring, and the semaphore arm remains at DANGER until further actions take place.

The "route indicator" has two armatures; one is a shuttle-wound armature, SA, capable of turning between the poles and carrying the pointer at the front of the dial; the other is an ordinary lifting armature, LA. The shuttle-wound armature is polarized by a special circuit supplied from the engine battery, as shown. The lifting armature closes the contact b, which completes a circuit through the main semaphore coils. The shuttle-wound armature carries a slotted sector, S, having depressions at each end. In the slot rides a freely pivoted rod which, when the sector follows the deflection of the armature, drops into one or other of the depressions and locks the armature, pointer, etc., in the deflected position. The sector and armature is mechanically released by the dropping of

armature, pointer, etc., in the deflected position. The sector and armature is mechanically released by the dropping of the armature of the main semaphore coils, through the rod r.

When the engine passes on to the bar B—the small semaphore arm being at DANGER, the bell ringing, and the "route

indicator" pointer in the central position—when the storsignals are off for, say, No. 1 line, a current passes from B, by br and br, through the "route indicator" coils to the engine frame and earth. The following actions take place in the indicators:—

1. The "route indicator"

1. The "route indicator" pointer is deflected to No. 1 on the indicator dial, and locked.

2. The lifting armature is raised for the time the current is passing through the "route indicator" coils and closes the contact b.

 \circ 3. The closing of b sends a current through the main semaphore coils, which raises the armature and breaks the contact c and also makes the contact d.

4. The breaking of contact c stops the bell. The making of contact d provides another path for a current through the main semaphore coils than that by b, which is broken as soon as the brushes br, br have passed off the bar B. Hence the semaphore indication is restored to what it was before the angine passed over her b.

the semaphore indication is restored to what it was before the engine passed over bar A.

In passing over subsequent energised bars, the action of the switch Sw is neutralised by the closing of the contact b, and no change takes place in the indication. Should the engine pass over an unenergised bar after passing over B, it is obvious that the neutralising of the effect of the mechanical opening of the switch Sw, by the shoe Sh, would not take place, and indications similar to those obtained at bar A would be received. This is the basis of the emergency DANGER signal previously referred to, the de-energising of the DANGER. DANGER

DANGER.

The line equipment by which bars are energised when required is simple. Movement of the signal levers in the ordinary operation of the signals to the off position closes switches connecting the batteries in the cabin with the line wires. Of the latter there are three; one goes to the DISTANT signal, and is connected to the bars B, C, D. One of the others goes to the ADVANCE signal for No. 1 line, and the other to the ADVANCE for No. 2 line. In each case the line wire is connected to the bar. Each of the line wires is provided with an indicator in the cabin, by which the signalman can see whether the bar is energised when he expects it is so. A small deflection only is given for this, the current being limited by the resistances connected to the bars B, E, and E. This resistance in no way interferes with the giving of the indications on the engine. A much greater deflection is obtained on the cabin indicators at the moment the brushes br, br of an engine are on an energised bar, and this, if looked out for, is to some extent an assurance that the apparatus is in order, and that the requisite indications are being duly given.

duly given.

The cabin circuits are easily followed. H¹ and A¹ are the levers for the HOME and ADVANCE line signals for No. 1 line, and H² and A² are similar levers for No. 2 line. The circuit and H² and A² are similar levers for No. 2 line. The circuit set up by the operation of the HOME signal lever is not complete until the corresponding advance has been operated. On the other hand the operation of either advance is sufficient to give an indication at the advance bar. Hence an off indication cannot be given at the bars B, C or D, unless both stor signals are off—which corresponds to the arrangements necessary to lower a distant line signal under ordinary interlocking—but such an off signal can be given at the advance without in any way interfering with the necessity for giving danger signals at the rear. The small tapper switches, T¹ S¹, and T² S², enable the "calling-on" signal previously mentioned to be given. Their normal position is open, as shown; when closed they simply intermittently take the place of the switch To be given. Their normal position is open, as shown; when to be given. Their normal position is open, as shown; when closed they simply intermittently take the place of the switch closed by the ADVANCE lever when the off signal is being given. As will be readily seen by the diagram, fig. 1, the direction of the currents to the line wire for B, C, D is different when H² and A² are operated, to what it is when H¹ and A¹ are operated, and the reversal of the "route indication" numbers follows.

The track bars are of steel, of T section, mounted on wood

The track bars are of steel, of T section, mounted on wood blocks and porcelain insulators

A consideration of the description of the apparatus will show how fully the system meets the conditions found to be necessary. It is adaptable in many other ways than those mentioned. The design of the apparatus is such as to give the fullest possible indication of failure of the equipment. The normal operating position of the semaphore arm is maintained by a continuous current, and interruption of which places the semaphore arm to DANGER, and inability to restore the arm to the normal running position is proof of such failure.

the arm to the normal running position to professione.

The arrangements by which the WARNING and DANGER signals are given by the mechanical raising of the shoe, obviate the necessity for relying upon the making of electrical contact with the bars of the track for giving these signals, and any failure to make such contact has only the result of causing off signals to be missed, and so does not in any way result in dangerous action. The apparatus is self-testing during the whole time it is in operation.

(To be continued.)

Patents and Alien Enemies.—The application of Mr. J. H. Meyer. 12. Lime Street, E.C., for a licence under Patent No. 7617/10 of Podszus, for an electric igniter for explosion motors, has been granted by the Board of Trade.

LEGAL.

THE PRIZE COURT

(Claim by Babcock & Wilcox, Ltd., allowed.)

PRESIDING over the Prize Court in the Admiralty Division, Sir Samuel Evans decided a question of the right to certain property forming part of an electrical installation, in favour of Messra. Baboock & Wilcox, engineers and boiler makers, Glasgow. The Crown had applied for the condemnation of part of the cargo of the British steamship Huanchaco, consisting of boilers, bricks and other material to be used in connection with an electrical works at Valparaiso, Chile. The goods were seized at Liverpool as enemy property the contention of the Crown being that the proprietary Valparaiso, Chile. The goods were seized at Liverpool as enemy property, the contention of the Crown being that the proprietary in the goods was in the Deutsch-Uberseeische Electricitäts Gesellschaft. The goods, it appeared, were shipped by Messrs. Baboock and Wilcox under a contract with the Garman company, and were intended for a company known as the Chilean Electric Tramway and Light Co., Ltd., which is registered in Great Britain. On behalf of the claimants it was contended that the German company were merely acting as advisers and buying agents on behalf of the Chilean company, in which the German company had a large financial interest, and that the proprietary in the goods never passed to the German company. It was further contended that Messrs. Baboock & Wilcox had never parted with the proprietary in the goods, and that the only persons who would lose if the cargo were condemned were the eminent firm of Scottish engineers.

The PRESIDENT, giving judgment, said that in this case he had come to a definite conclusion upon the matters that he had to decide. The question was whether or not 324 packages containing decide. The question was whether or not 324 packages containing certain boilers and plant and a large number of loose bricks were enemy property. He had come to the conclusion that the German company were independent contractors, and that there was no privity of contract between Baboock & Wilcox and the Chilean company. But whether that was so or not he did not think mattered. The contract, he thought, was between Baboock & Wilcox and the German company, and the question was whether the proprietary in the goods had passed from the former to the latter. The goods were put on board at Glasgow and the ship proceeded to Liverpool, where they were seized on August 27th. The contract under which the goods were shipped was dated January 7th, 1914. The German company had also some time in 1913 entered into a contract with the claimants for the erection of four boilers in contract with the claimants for the erection of four boilers in connection with electrical works at Valparaiso. In 1914 it was intended to extend those works, and the contract of January 7th, 1914, was the contract for that extension. Some of the terms of the earlier contract were not again repeated in the later contract, but they were referred to and incorporated in the later contract, but they were referred to and incorporated in it. According to the contract of January 7th, 1914, what Babcock & Wilcox had to do was to supply a complete boiler installation and accessories for the extension of the works which had already been carried out in 1913. The description of the work was under four heads, and the amount to be paid was distributed between the four items, the total amounting to £7,473. This sum was to be paid by instalments, the last instalment at the expiration of one year's guarantee. The installation was to be erected under the supervision of a man sent out by the claimants, and a certain time was to elapse before the works were taken over. It was not till one year after that that the flual instalment was to be paid. The cargo in question comprised only a part of the plant and did not complete the material necessary for the erection of the works. Unquestionably the goods seized were materials which would have been used in erecting goods seiz d were materials which would have been used in erecting the works, but what he had to decide was whether the proprietary in these disjointed pieces had already passed, or whether the passing of the proprietary depended upon something that was to be done at a later stage. The contract between the parties was not for the particular articles in fact seized. The contract was for the installation into which works these materials were to be put, his opinion there was no passing of these disjointed pieces of goods. They were not sold as such. No separate price was fixed for them. They were only part and parcel of the whole quantity which had to be supplied. The authorities made it perfectly clear that these goods could not be treated as separate goods in respect of which there was a complete contract and a passing of property. Here there was no contract for the separate sale of the goods in question at all, and he held that at the time of seizure the proprietary had not passed. He therefore ordered that the goods be released to the claimants.

WORKMEN'S COMPENSATION.

Ar the Salford County Court, last week, Charles Atherton made an application under the Workmen's Compensation Act, the respondents being Messrs. Eckstein, Heap & Co., Ltd., manu-facturing electrical engineers.

Mr. Sandbach stated that the applicant had been employed by respondents at a weekly wage of 24s. While grinding an iron clam on an emery wheel some of the metal flew off and struck him clam on an emery wheel some of the metal flew off and struck him in the eye, and an operation had to be performed. He attended at the hospital from September 2nd to Ootober 29th last year, and during that time he was paid half-wages, while the respondents also gave him an extra allowance of 5s. per week, as he had a wife and family. On Ootober 29th he returned to his work, but was put on a different job, and was a kind of odd man. His eyes were painful, and he could not see to do his work properly. On December 3rd he was given a week's notice. The man had since tried to get work at several places. ATHERTON, in evidence, bore out the opening statement, and added that he did succeed in getting a situation at one place, but was discharged because he could not see to do his work.

Cross-examined: He denied that when he returned to Eckstein's he was discontented and careless, and declared that he did not refuse to do certain work on December 3rd, which led to his appearance at the office of the works manager. He stated that it was not in consequence of his refusal to do certain work that he was discharged.

Dr. Shand, of Regent Road, Salford, stated that he examined the applicant on January 6th. The man's eye, he said, was inflamed, and it appeared to cause him considerable pain. He

inflamed, and it appeared to cause him considerable pain. He could not follow his work except under great difficulties.

Cross-examined: Dr. Shand said he was not an eye specialist.

ME. MCCLEARY, for the respondents, said this was one of those cases where a man would be better off without the Workmen's Compensation Act. He was employed by a most excellent firm, suffered a small accident, and was incapacitated for a short time, and it was fair to assume that if it had not been for the Act the man would have been looked after and would have returned to his a contented man, and not a discontented man going about spreading discontent among the other workmen and saying the firm could not discharge him. His conduct culminated on D scember 3rd in his refusal to obey orders.

MB. FRANK PANTER, works manager, spoke to the applicant's discontented attitude when he returned to work, and stated that he was put back on his old job, and never complained that he was

not able to do the work.

DR. WHARTON said that he had examined the man, and, in his opinion, there was nothing to prevent him doing his work as formerly.

On JUDGE GURNEY'S suggestion, the man was examined by both doctors in an adjoining room, and on their return to Court, Dr. Wharton said there was no inflammation, and Dr. Shand said the inflammation had subsided somewhat, but was still

JUDGE GUENEY said the doctors had set him a nut to crack, and the best thing he could do, in the absence of a medical referee, was to say that the man was perfectly able to do his work. The award, therefore, would be for the respondents.

IRISH JUDGMENT SET ASIDE.

THE King's Bench Division, Dublin, has set aside a judgment against Mrs. Morrow, 3, Upper Leeson Street, for £29 6s. 4d. in an action brought by Mr. J. C. Meldon, electrical engineer, against that lady and her husband, Mr. R. Morrow, for a supply of electrical fittings, the ground stated being that the judgment was marked by surprise and through a mistake on the part of defendant. Mr. Bartley, in resisting the application, said the fittings had been sent to Mrs. Morrow.

TRAMWAY ACCIDENT CLAIM.

IN the Glasgow Court of Session, before Lord Ormidale, the record was closed in an action by Janet Henderson and Aunie Henderson against the Musselburgh and District Electric Light and Traction Co., Ltd., for £1,000 and £750 respectively for the death of their father, John Henderson, 65, farm labourer, by the alleged fault of the defenders. On March 17th, 1914, he was leading a horse and cart at a walking pace out of the gate at Fowler's Brewery, Prestonpans, and across the car lines, when a tramcar ran into the cart, with the result that the car swung the cart and horse round to the side. The horse took fright, and the deceased was dragged round with them. He suffered from shock, and died the following morning. The defenders deny liability. Issues for trial were ordered.—Glasgow Daily Herald. Daily Herald.

P.M.G. v. OXFORD ELECTRIC TRAMWAYS Co., LTD.

AT the Oxford County Court last week, the Postmaster-General sued the defendants for £6 damage to a telegraph pole. Mr. W. N. sued the defendants for £6 damage to a telegraph pole. Mr. W. N. Raywood, who appeared for the Postmaster-General, said that the facts had been agreed. A motor-'bus ran into a telegraph pole, the property of the Postmaster-General. The claim was made under Sec. 8 of the Telegraph Act, 1878, which enabled the Postmaster-General to recover damage done to the telegraph line by any undertakers, bodies or people. Mr. Raywood asked for leave to appeal, and his Honour granted the application.—Oxford Chronicle. Chronicle.

Norwegian Nitrogen.—The Société Norvegienne de l'Azote reports gross profits of £468,000 for 1913-14, as compared with £442,000 in 1912-13, and net profits of £316,000 and £287,000 in the two years respectively. It had been proposed to pay dividends of 8 per cent. on the preference capital and 6 per cent. on the ordinary shares, but these recommendations are not to be carried into effect. The company had concluded a loan with the Société des Annuités, of which two-thirds had been completed on the outbreak of the war. At present the work of extending the plant at Rjukan is at a standstill, owing particularly to the impossibility of securing the delivery of machinery on order, in consequence of the war. Norwegian Nitrogen.-The Société Norvegienne de

THE HARDENING OF METALS.

THE first autumn meeting of the FARADAY SOCIETY was held on November 23rd, and took the form of a general discussion on the important subject of the Hardening of Metals. Sir ROBERT HADFIELD, the President of the Society, was in the chair, and the meeting, which was largely attended, included some of the best known workers in this branch of metallurgy.

some of the best known workers in this branch of metallurgy. There are three fundamental ways in which a metal or an alloy can be hardened:—

1. By cold working.

2. By chilling; usually suddenly from a high temperature; but sometimes by moderately slow cooling. In one instance referred to by Professor Howe, in a valuable communication which he sent from New York, cautious reheating is required for hardening, in the case of Maurer's austenitic manganese steel.

3. By the mere admixture of different kinds of molecules. In the case of pure metals it is obvious that hardening must be caused by some change of state, and the question resolves itself into what is the nature of the change of state. Pure itself into what is the nature of the change of state. Pure metals, as normally cooled from the molten condition, are crystalline in structure, and the change of state that hardens them must be either a re-arrangement of the crystals or a change of crystalline form, or a change from a crystalline to an amorphous form. Dr. Beilby has within the last few years brought forward a considerable body of experimental evidence which goes to prove that when pure metals are cold worked, and thus hardened, the surfaces of the crystal grains are flowed into a smooth, hard, amorphous vitreous layer or skin, and it is this amorphous skin so formed between the crystal grains which is the cause of the hardness brought about by cold working. The question arises as to whether, accepting the theory of the amorphous state, hardening by chilling or the hardening of alloys can be made to fall into line with this explanation of hardening by cold working. ing by chilling or the hardening of alloys can be made to fall into line with this explanation of hardening by cold working. Dr. Beilby claims that there is no essential difference between the two processes, the contraction strains due to chilling supplying the mechanical work necessary to convert the crystalline into the amorphous state. The theory has been applied to the general case of hardening by quenching by Professor Edwards and Professor Carpenter, and to the particular case of steel by Mr. J. C. W. Humfrey. The former maintain that the hardness produced by quenching is brought about by crystal twinning, and possibly direct slipping, and the resulting formation of amorphous layers. Mr. Humfrey's theory of hardened steel is an adaptation of the amorphous theory to fit in with the old allotropic theory (somewhat distheory to fit in with the old allotropic theory (somewhat discredited at the Faraday discussion), which considers hardening to be due to the existence above a certain critical temperature of an adamantine γ form of iron which sudden cooling prevents from slipping back into the normal form that is stable at low temperatures.

The amorphous theory was criticised by the President, Professor Howe, Dr. Desch, and Mr. A. McCance. The main ground of Sir Robert Hadfield's objection appeared to be his ground of Sir Robert Hadfield's objection appeared to be his unwillingness to concede that the extraordinary hardness of steel was of the same character as hardness caused by cold working, and in this he was supported by Professor Turner. It was improbable, said Sir Robert, that the glass-hard surface of a projectile weighing a ton, which would cut through 15 inches of steel without being fractured, could be in a state of strain. The hardness must be brought about by chemical change, and the fact is the carbon and its condition must be the principal factor as a cause of the extreme hardness of steel, and it has been too much overlooked in the theories that have been put forward. In this Dr. J. E. Stead concurred. In his opinion the different behaviour of hardened and annealed steel when treated with chemical reagents proved

curred. In his opinion the different behaviour of hardened and annealed steel when treated with chemical reagents proved that there was a difference in their chemical constitution. Professor Howe considered that the amorphous theory would explain all those cases of hardening where there was a martensitic structure in the hardened steel. There was, however, a non-martensitising way of hardening, namely, by holding manganiferous austenite (Hadfield's manganese steel) slightly below the transformation range (e.g., at 550° C.), whether the cooling thence be fast or slow, and this could not be explained by the amorphous theory, because at such high temperatures amorphous iron should be able to recrystallise.

Mr. McCance objected to the amorphous theory on the ground, among others, that strained a iron and strained γ iron were dissimilar in magnetic properties, whereas if straining produced the amorphous variety the effect in both cases should be the same. Indeed γ iron cannot be made ferro-magnetic by any treatment such as permanent deformation mation.

mation.

The result of the whole discussion left the impression expressed by Dr. Stead, namely, that interesting and important as are the several theories of hardening now current, we have not as yet sufficient data on which to base dogmatic conclusions. What may be called the Sheffield School has little doubt that on the carbon condition mainly depends the extreme hardness of steel, and Sir Robert Hadfield himself feels as strongly on the matter that he has offered a Research Prize of £200 in order to stimulate the study of the carbides of iron and of iron alloys generally. and of iron alloys generally.

EDITION 1915

IN PREPARATION.

H. Alabaster, Gatehouse & Co., 4, Ludgate Hill, London, E.C.

ENGLISH AND **AMERICAN** WIRING RULES AND REGULATIONS.

In a recent issue of the Electrical Review and Western Electrician, namely, the issue bearing the date December 5th, 1914, a detailed comparison was made between the "National Electrical Code," which is in use in the United States and Canada, and the German and English rules. The comparison, which is set out in three parallel columns, occupies 10 pages of the journal referred to, although it deals solely with the wiring rules concerned with inside work, which form considerably less than half of the complete code; the latter covers also the wiring of central stations, transformer sub-stations, outside work, marine and miscellaneous work, in addition to comprising a large section devoted to constructional details of fitting, cables, switches, and other wiring accessories.

In our Institution Rules the standards adopted for cables, conduits, &c., are those defined by the Engineering Standards Committee (E.S.C.). The rules make reference to these but do not quote them in extenso. It is very doubtful if the average contractor has ever troubled to read them or even to obtain a copy, and the average wireman has probably never heard of them, nor do they greatly concern him. The contractor knows that there is a difference between "Association" and "non-Association" cable, but he knows more about the diff-rence in the price than in the cable, and he must accept the maker's guarantee as an article of faith. As to applying any tests to prove that he is getting what he pays for, we doubt if anything beyond gauging the wire is done, and it would be beyond the practical capabilities of many to measure the resistance of a coil with sufficient accuracy to say whether or not it came within the permissive margin of 2 per cent. variation from the standard. We do not say this in disparagement of the wiring contractor; he does not regard it as his business, nor has he generally the necessary measuring appliances.

Seeing that he is entirely at the mercy of the manufacturer, there is something to be said in favour of the system of testing and issuing certificates of approval which has been adopted by the National Board of Fire Underwriters in the We assume that so long as a contractor working under the National Code employs "a proved" materials, he accepts no responsibility in connection with them, but this point is not clear

The National Electrical Code is revised every two years, and the time for revision is now approaching; it is possibly due to this fact that so much attention is at present being devoted to the dis u-sion of wiring matters in the American technical Press. There appears to be a feeling that electric wiring is passing, or about to pass, through a transition period in which the piping or conduit system may have to give place to some of the later systems which have been devised, just as easing has been gradually, but none the less surely, replaced by conduit. There is in this country at the present time a ten len y to ask if all the advantages supposed to be possessed by conduit wiring are real or mythical, and many contractors, some consulting engineers, and, we believe, also insurance companies, are disposed to look more favourably upon wood cosing installations now that jointing has been largely super-eded by looping of connection fittings Eliminate joints from the conductors actually enclosed by the casing, and there is very little left in the system which can be objected to from the

point of view of fire risk when it is used for ordinary residential buildings, and in dry situations. It will be generally agreed by those competent to express an opinion, that a good casing installation is better than a poor conduit job.

The chief objections to the wood casing system were the risk of fire due to bad jointing or connections within the casing, and the unsuitability of casing for sinking flush or burying in plaster when surface work was undesirable.

It is not without interest to note that the special wiring systems which have from time to time been brought out, such as the Stannos system, Henley's wiring system, and cab tire sheathing, owe their inception to cable makers rather than to electrical contractors, as was the case with wood casing and conduit. We do not think that it is claimed by the originators that any one of these systems is capable of universal application, although no doubt each has merits when confined to specialised or particular classes of work.

Conduit wiring is the prevailing practice in the States, and, judging from the tone of the technical Press, we gather that there is a fear among the makers of conduit that the National Code may be revised so as to admit newer methods in which conduit is not used.

The essential difference between our own Institution Rules and those of the National Electrical Code is that ours are of a more general character, specifying the conditions which are to be complied with rather than the actual methods to be adopted and the specific details of fittings and materials to be employed. This is what the National Code purports to do, and is, no doubt, one of the chief reasons which necessitate its frequent revision.

The National Electrical Code is the official code recommended by the National Fire Protection Association, and is drawn up chiefly by men interested in electrical work from the fire insurance point of view. Our ru'es, on the other hand, are drawn up by a Committee of the Institution of Electrical Engineers representing the various sections of the electrical industry, and including also representatives from the insurance companies. This may are unt in some measure for the greater stringency of the National Code on some points. We do not think that we should serve any useful purpose to English readers by tabulating in parallel columns the National Code and our Institution Rules, because in many respects, where they cover the same ground, the differences are only verbal. There are, however, notable differences here and there due in part to the different character of the constructional work obtaining in the two countries, but the chief characteristic which distinguishes the Code from our Rules is, as mentioned above, the section in the Cole devoted to details of manufacture. Now that our own manufacturers are more fully alive to the export business which may be done, perhaps not with the States, but with the Dominion of Canada, we think it is important that they should appreciate that any fittings designed for use in that Colony will not only have to be in accordance with the National Code Rules, but will have to be officially tested and approved by the laboratories of the National Board of Fire Underwriters.

We understand that the B.E.A.M.A. has the matter under consideration, and that attempts are being made to induce the Revising Committee to modify certain of the regulations in order to bring recognised and approved British fittings within the requirements. There is no doubt a feeling in the States that some of the conditions are unnecessarily stringent, and that they tend to retard the rate of electrical progress. If, therefore, without sacrificing anything which tend to safety and immunity from fire risk, the Revising Committee is of opinion that some of the restrictions may be relaxed somewhat, it is quite probable that some modifications will be made. But such modifications, if any, will be made solely in the interests of electrical work in America, and not for the purpose of making it easier for British manufacturers to compete with American productions in the American and Canadian markets. Too much, therefore, must not be expected from the forthcoming revision, but our manufacturers must rely rather on modifying their designs where necessary so as to comply with the Code. Whilst we do not propose here to enter into a detailed comparison of the American and English rules, we would refer our readers to a critical commentary which is concluded in this issue by Mr. Frank Broadbent, whose paper on wiring rules, read before the Newcastle Section of the Institution in February, 1901, was among the first which showed in tabular form the extraordinary differences then existing between the rules of the Institution and those of various supply authorities and insurance companies in this country. Happily since that date the revised Institution Rules have been adopted as the National Standard, to the advantage of all concerned, and if subsequent revisions on both sides should bring about a greater degree of uniformity between the American and British National Codes, the advantages would, no doubt, be mutual.

NATIONAL TRADE POLICY.

British manufacturers have been so often accused of indifference in connection with export trade development, that we fear that much of the criticism and advice that are vouchsafed through the columns of trade journals, or by the medium of special trade reports, receives but scant attention. It is a thousand pities if that is true, for many of those who take the trouble to express their views have the best interests of British industry at heart, have firsthand and authoritative information upon which they base their criticism, and find no satisfaction in mere depreciation of the doings or misdoings of their own race. There can be no question about our having done ourselves a good deal of injury in past years by wasting so much time in discussing the opinions of people who have seemed to be in the seventh heaven of delight when they have been advancing "proofs" of our decadence as a nation. Physically, scientifically, industrially, and spiritually—according to the particular exponent of the phase and of the time-have we been on the down grade. Somebody was soon to write the "Decline and Fall of the British Empire"! Unfortunately, discussions of this kind cannot proceed within our borders without outside observers, who do not understand the British character, accepting us at our own apparent valuation.

It hardly lies within our province to dwell upon the view held by some students of these days that from the standpoint of national character this terrible war, notwithstanding all its awful loss in blood and treasure, is not only going to stay or prevent any tendency in the direction of decadence which affluence and internal differences might have induced, but is going to re-establish the prestige of the British nation in respect of the high standards for which it has so long stood. All the old qualities of our fathers have reasserted themselves. Who talks of physical degeneration, of spiritual apathy, after five months of war? Bernhardi-Shaws, "Gloomy Deans" and some evening newspapers are not to be seriously regarded.

Yet we shall not be well advised if we allow to pass unheeded those who ask us not to imagine that all is well with our methods when we consider our relation to the world-trade problems.

Communications continue to reach us from all parts of the Empire, to which we are compelled to afford publicity if we are to fulfil faithfully what we regard as our duty as Editors. It is, and always has been, distasteful to refer to British shortcomings in respect of our export trade, but the views recently expressed by some of our correspondents in India and Canada are typical of many such criticisms that reach us, and they should not be ignored; more are before us as we write.

An Indian critic accuses us of "utter slackness"; a Canadian correspondent says that Britain loses trade in Canada "through lack of attention"; an Australian writer gives us statistics showing the attention that Americans have been paying to the Commonwealth, as evidenced by his own correspondence received since the outbreak of war; others hold up for our reproof the courtesy and eagerness of Continental firms. All of these criticisms are so much like what we have heard for many years past, that we are not justified in suspecting them of

relating to isolated and exceptional cases, though we recognise that there may be another side to every complaint. If we mention them now it is less with a desire to decry the methods of the British manufacturer—there is no useful purpose to be served by that alone—than to suggest that when we are contemplating more aggressive efforts to meet the electrical and engineering requirements of other countries, we should remember the frame of mind of some of our potential customers and the virtues credited to our competitors.

We have already dwelt at some length upon the need for co-operative action on the part of manufacturers, though we have not yet witnessed any very strong movement in that direction. Probably the lack of it is due to the pre-occupation of our firms with direct or indirect Government orders, to the handicap due to absences on active service, and to the indisposition to make definite movements while our national life continues under a cloud owing to the enforced slowness of military operations in winter. But we must continue in these days to prepare for what is to follow when conditions change, as they must do before long-perhaps sooner than we think. While we are trying to possess our souls in patience con-cerning the forward movement in France and Belgium, forces and equipment are being prepared which will make victory sure. There is the same call for patience in regard victory sure. There is the same call for patience in regard to the Trade War, for the opportunities for actual advance are not facilitated by the financial and shipping difficulties that now prevail; but there is as great need for preparing ourselves as business men, as there is for training and arming Kitchener's Army. There is a strong desire in the Colonies that such an invulnerable line shall be drawn by our trading forces that Germany shall not again be able to break How are through into markets which by right are ours. we going to make that line invulnerable? If there have been weak places, owing to faulty methods in the past, we ought to sit down seriously, not showing ill-will at the strictures of our critics, and weigh up the whole matter and adopt measures to prevent the existence of vulnerable points in the future. We refer now, of course, to that kind of reform that lies within our power as manufacturers or traders—an improvement of our own trading efficiency.

We, of course, recognise that there are other matters of prime importance that lie beyond the power of the individual trader. There is a very strong conviction in some quarters that something in the nature of working co-operation, concentration, or even amalgamation of interests, is required in order to enable British firms to deal with the industrial position effectively, so as to prevent unscrupulous aggression on the part of Germany's consolidated electrical and financial forces both in the Home and Colonial markets in the future. That is a matter essentially for manufacturers who know the difficulties with which they have had to contend, but those who study the position as onlookers cannot forget the advice that has been vouchsafed by experienced minds, nor can they shut their eyes to the results that followed the "bulk" manufacturing operations of Germany and the United States. Without such concentration, there must continue a vast amount of wasted effort and expense always adversely affecting the cost of production. The spectacle of half-a-dozen comparatively small British firms competing against each other in a British colony for a contract, while a powerful German or American organisation carries off the prize, is humiliating to all save the winner. If concentration of interests is not acceptable, let us at least have something in the form of organised British cooperation, and secure the spoils for division among British

We fear, however, that some of the most representative spirits in the electrical industry are disinclined to plunge into new ventures or to assume added liabilities and responsibilities because of the failure of the Government to listen to the appeal that has been made to it to formulate some policy in regard to the future fostering of British industry. It has done something through the increased activity of the Board of Trade Commercial Intelligence Department—we have no desire to belittle the importance of that. Still less do we wish to underrate its significance—it must consistently lead the Government on somewhere else—but where?

Although we recognise that the Commercial Intelligence Branch has been doing its best under the circumstances, and that it will make more heroic efforts still in the interes s of British trade, we cannot help feeling that it is at present severely handicapped. We may be wrong, but it seems that in at least two important directions it requires strengthening in personnel. It has been shown again and again that the ordinary tea and toy salesman cannot expect to succeed in the electrical industry until he has had some more or less specialised experience therein; that the British Consul is hardly the best class of representative to cultivate trade; and we believe it to be equally true that the average civil servant type of official requires, for the work of the Commercial Intelligence Branch, to specialise in certain departments, or else his services should be assisted or supplemented by somebody who is tolerably expert in those departments.

The Advisory Committee cannot be expected to fill the needs that we have in mind.

In another direction, too, strengthening might be introduced. We have felt at different times the benefit of being able to confer in London and in the provinces with national trade representatives returned afresh from the scenes of their labours. They have been able to tell us in conversation in half-an-hour more of the special things that we wanted to know than we could have ascertained in months by correspondence either with them or with the Branch in London. There are capable Commissioners representing this country in different parts of the world who have accumulated a most valuable knowledge of the markets in which they have resided, and it seems to us that their presence in London for the next few years would be of material aid to the Department and to British traders. In this connection we might do well to take a leaf cut of the German Consular Service book, for in the German Consular the Commercial Department in Berlin a strong point is made of having always at hand men with knowledge and experience of the overseas markets, able to explain the local conditions and the standing, &c., of the people doing business in those markets, to the home manufacturers and traders. There may be blame attaching to the latter for not paying frequent and thorough visits to the markets abroad, but the Consular representative could give them guidance which we doubt not would frequently encourage them to travel rather than justify their stay athome policy.

As our readers will have noted, there are as many schemes for the reorganisation of the Board of Trade as there are self-appointed reformers in these days. There always have been demands for modernisation in that department, and we have ourselves agitated that way, but we fail to see the wisdom of clamouring just now for a complete upheaval, for we cannot see that it is within the scope of immediately practical politics. Yet some action is required, and the Government ought to assist industry by announcing what, if any, new policy it proposes to introduce. The country is, if we understand its present temper, disinclined to be hampered by the trammels of the past, and it does not want a revival of old controversies; what it does want is to be able to assure its manufacturers who have done so much, and in so many ways, to assist the nation at a time of crisis, that something in the form of safeguards or assurances shall be given that the British markets shall not be the future playground for every German who pleases to come over here to undercut those who make present sacrifices to manufacture the things that we need.

As we have said before, the Government has enormous undertakings in hand, and nobody wishes to unduly han per it in conducting these concerns efficiently, but it has had some very detailed, trying, overloaded, and fatiguing Sessic ns before, and present claims upon the Cabinet's attentions may not be greater than in those days. Every member of the Cabinet must have brought his mind to bear upon the question of Germany's future trade position in these islands and in our Colonies; doubtless all the members together have already discussed the subject in some of its bearings. We should be sorry to see them divided at such a time as this, but we do again urgently appeal to them to shake off this attitude of the closed lips, and say something for the guidance of British manufacturers.

It seems to us that it is not only manufacturers that need

to revise their methods of dealing with foreign trade, but also the Government.

It will be a matter for something more than regret if, when we write of the electrical industry in five years' time, we have to say that the greatest opportunity we ever had was allowed to slip by with only very small advantage accruing to the British manufacturer, because the Government of the day would not say the word necessary to give the justification for special efforts.

Just as we are writing we observe an important letter in the Times from Lord Cromer, who, writing as a Unionist Free Trader on the question of the aniline dye industry, admits that "a Protective tariff, bounties, subsidies, or a guarantee on share capital," though irreconcilable with the Free Trade doctrines "as heretofore accepted in this country," "can be justified on the ground of national emergency." He says other things as well which for our present purpose do not matter, but the above remark, we believe, represents the view of many others who would not have approved of it some months ago. "The ground of national emergency"—that is the crux of the whole matter. In an "Appeal to the Government," published in our issue of October 23rd, 1914, we requested the Cabinet to appoint a Commission to consider the bearing of the war upon the future of industry, and we asked it to consider the advisability of requiring all public money in future to be expended as far as practicable on British-made goods. We are interested to read now, in Times dispatches from Paris and Petrograd, that the Chancellor of the Exchequer and the Russian and French Ministers of Finance are to meet in Paris for a conference on financial questions "having special reference to furthering the cause of trade with Russia and the Allied States." This lends support to our suggestion expressed above, that future trade matters have been under discussion in our Cabinet. Though we have not secured the appointment of a Commission yet, it is pleasing to find that the Allies in Arms are about to consider officially the great question of remaining Allies in Trade.

The immensity of the Russian market, and the share in it which Germany has thrown away in the mad rush of militariam, surrounds this conference with a kind of glamour. That Russ a will extend a preference of considerable value to us may be regarded as a certainty, but the problems of cheapening the cost of production, and of cutting the claws of tentacular financial control, are not going to be easily settled. The three European Allied Governments will, we trust, see their way to adopt a strong policy in commercial affairs which shall show the enemy that never again will her "will-to-power" policy be allowed to prevail in countries from which she has hitherto derived wealth which has enabled her to drench the soil of Europe with human blood. We credit the Chancellor of the Exchequer with ability to gauge the temper of the people, with a readiness to adjust his political thinking bringing it into subservience to national interests—as witness the Patents Act of 1907—and with a desire to confer with business men before he takes action in regard to matters in which he needs guidance from experts. We hope that before this Conference at Paris he has let down the plumb-line among British business men; or, if not, that he will do so when he is in a position to report upon the suggestions which it may be in the minds of our French and Russian Allies to make.

British Electrical Exports and Imports during 1914. In accordance with our usual custom in January, we publish in this issue a series of curves which indicate at a glance the general trend of British electrical export and import trade during the past 12

months. The curves bear striking testimony to the effects of the war, which has led to a substantial reduction in the value of our export business, and the rapid replacement of Germany by the United States as the principal importer of electrical goods into this country. German overseas business has, of course, disappeared since the beginning of the

war, but our American friends, with characteristic hustle, have more than made up the leeway, so that the imports, as a whole, have almost reached the monthly values prevailing before the war.

The shortage of labour, if not of plant, together with the partial dislocation of shipping and finance, brought about by the war, has tended seriously to handicap the efforts of our own manufacturers in foreign markets, and even internal electrical business, of which we have no record, doubtless gives place to the pressing necessities of the business of war and incidentally leaves an additional opening for the importer. The falling-off in our electrical exports shown by the curves does not necessarily mean any shortage of profitable employment by our firms; indeed, it may be quite the reverse.

Rubber. THE market for rubber has been much affected by a number of difficulties which have had to be faced and overcome, so far as possible, in connection with the export trade, which has been under more or less of a ban in consequence of the export prohibitions in force. Sentiment in this connection was particularly affected by the stoppage of trade with the United States, and this for a time was, indeed, the chief depressing factor. Some relief has, however, been lately experienced in this respect, since a compromise was come to between the Governments of the United States and this country as to a partial resumption of shipments under effective safeguards.

There has been a good deal of business moving during the last few weeks, and the market has shown a tendency towards recovery. American interests have re-entered the market as buyers, and have purchased very considerable quantities in anticipation of the development referred to. This has, of course, tended to stimulate the demand in other directions, and quite large quantities have changed hands. The market has shown a rallying tendency, prices having been advanced to about 2s. 3d. a lb. for No. 1 latex for spot delivery.

The position in the United States was at one time very stringent on account of the stoppage of shipments from this side, which naturally impelled the necessity of arranging for consignments from Brazil direct, which was a somewhat difficult matter. Prices of plantation rubber in New York were at one period run up to figures equal to about 3s. 9d. a lb. for fine grades, but there has since been some reaction. The market conditions were, of course, for a period rather artificial. The stocks in American consumers' hands are now believed to be very much reduced, and there is a continual drain upon the reserves of raw and manufactured material in connection with the pressing demand of the belligerent Powers on the Continent for tires, &c.

As regards the statistical position in Europe, there was last month a very considerable increase in the London stock, in consequence of accumulated arrivals, but in the course of this month the deliveries have been improving, and it is generally presumed that the present stock will be lessened by slow degrees.

Supplies have been coming forward from the Near East more freely, the total December exports from the Federated Malay States being a record, at 3,361 tons, making a total for the 12 months of 30,697 tons, which compares with 23,463 tons in 1913 and 15.507 tons in 1912.

The state of the manufacturing trades in Ru-sia has been desidedly more encouraging, requirements in that country having assumed much larger proportions, and this may be regarded as an important factor in connection with future developments in crude material. In Germany rubber is very scarce, and manufacturers' operations in many cases have had to be suspended, the State having first claim upon everything available. The fact is considered as being rather significant that the German Government has entirely prohibited the selling of such articles as motor-cars and their tires, except under permits, which sufficiently explains the conditions which are beginning to obtain there.

ELECTRIC LIGHTING AUTHORITIES AND THE LAW OF RATING.

FROM OUR LEGAL CONTRIBUTOR.

(Concluded from page 103.)

THE application of the principle of this case was illustrated in the assessment of the property of the Charing Cross Electricity Supply Co. (see Konstam's Rating Appeals. page 22). The company had a generating station and mains in the parish of Lambeth, but they did not supply electricity in They supplied electricity in all the parishes that parish. of the City of Westminster, in respect of which there was an appeal, and elsewhere. The greater part of the electricity supplied by the company in Westminster was brought by them from the generating station in Lambeth, but a part was brought from another generating station at Bow. The was brought from another generating station at Bow. company had a sub-station situated partly in the parish of St. Martin-in-the-Fields, and another sub-station wholly in the parish of St. Martin-in-the-Fields, besides sub-stations The property in Lambeth, therefore, consisted elewhere. entirely of indirectly productive works, and that in Westminster partly of directly and partly of indirectly productive The capital value of the indirectly productive portion was estimated at £543,666, and of the directly productive portion at £314,696. In the event, the generating station and mains in Lambeth were estimated at £16,106, with a rateable value of £8,053, while the other properties in the Westminster parishes were estimated at £35,559 gross and £19,000 rateable.

Unfortunately for those whose duty it may be to ascertain the rateable value of electric light works in the future, the report of this case gives but a vague idea of the method adopted in arriving at the figures. Nevertheless, the following conflicting figures with regard to repairs and renewals are of interest. Mr. Patchell stated that, in his opinion, the proper amounts to be set apart annually for renewals were, in the case of—

Mains, 3 per cent. on the capital value.
Buildings, 1½ per cent.

Accumulators, 10 per cent.

Other plant, 5 per cent.

Major Cardew, however, who gave evidence for the rating authorities, said that the proper allowance for repairs and renewals of accumulators was $8\frac{1}{2}$ per cent. of their value. The mains had, in his opinion, an average life of 40 years, and would be worth 12 per cent. of their prime cost at the end of that time. The sinking fund necessary to replace them would be 1.14 per cent. of their value, and not more than 2 per cent. would be necessary for the annual repair of the mains. Unfortunately, the report of the case to which we have been referring does not state which of these two sets of figures was acted on by the rating authority.

Raling of Works in Excess of Existing Requirements. -It often happens that electrical undertukers have extra space, and sometimes spare plant, which is in excess of their exis ing requirements, and is laid down for the purpose of meeting extensions in future years. The question whether this part of the property is to be brought into rating has been considered in a number of cases, but not electric supply cases. In R. v. South Staff ord Waterworks, 1885, 16 Q B D. 359, the indirectly productive works were largely in excess of the then existing requirements of the company, and had been constructed for use in future years. The rateable value of the whole system was agreed, the point in dispute being the proper amount of deduction to be made therefrom. It was found that if only so much of the permanent works as was required for the purposes of the present supply was brought into rating, the rateable value of the whole would be materially diminished. The following passage from Lord Esher's judgment in the Court of Appeal serves to show the attitude taken up by the Court :-

"There might be works of the undertaking which had not become part of the actual system, as, for instance, a reservoir, or a second lot of engines not yet used at all, but constructed with the view of becoming part of the works

in the future. Such could be no part of the existing system of works, but would be intended for another system, and would, of course, be rejected in making the calculation. But that is not the case, for here every part of the works is in actual use, though they are too large for the supply of water at present required. . . . But as the works in use are in excess of the present requirement, a tenant taking the whole or part of the property in a particular parish ought not in justice to be asked to pay the same rate of rent as he would if all the works were earning profit. Therefore, if the 31 per cent. mentioned by the arbitrator is the ordinary percentage upon the value of the capital laid out, one would think that the percentage in this case should be reduced to 3 per cent. or less." It would seem from this case that it would be perfectly proper for a rating authority to make a reduction on account of the spare space inside a generating station. The question whether there could be a reduction for a spare "set" is rather different, because prudent people would not run a large station and undertake to give a continuous supply without making provision for breakdown.

Where a Local Authority are the Undertakers.—It was at one time thought that if a municipal corporation or other similar body occupied land, and the whole of the profits of the corporation were by statute devoted to public purposes, the corporation had no beneficial occupation and were not rateable. This, however, is an erroneous view, and all such property now comes into rating, although, as the local author ty has to spend the rates, or a greater part of them, the money is to a large extent taken out of one pocket

only to be put into another.

Should anything occur to render the undertaking of an electric lighting company less profitable, it is conceived that a reduction may be obtained, but it is clear that the cause must be of a permanent nature. In R. v. Islington Assessment Committee 30 T.L.R 149, it appears that by Sec. 47 of the Valuation (Metropolis) Act, 1869, where in the metropolis a requisition is made to the overseers to send to the Assessment Committee a provisional list showing a reduction, from any cause, in the course of any year, of the rateable value of a hereditament, and the overseers make default, the Assessment Committee must appoint a person to make such provisional list. The London County Council were the owners and occupiers of tramways in the Borough of Islington. In 1912 and 1913, owing to the competition of motor-omnibuses, the gross receipts from the tramways had fallen from 11.42d. per car-mile to 905d., and on April 4th, 1913, a requisition by the London County Council was served on the Islington Borough Council, as overseers of the parish, requiring them to send to the Assessment Committee a provisional valuation list showing the reduction in the rateable value of the tramways, on the ground that they had been reduced in value within the meaning of the section. The Borough Council declined to accede to the requisition, and on an application by the London County Council to the Assessment Committee that body came to the conclusion that there was "no primâ facie evidence of such a reduction as is contemplated by the section," and they, therefore, declined to appoint a valuer. It was held by the Court of Appeal (Vaughan Williams, L.J., dissenting), that the Council had failed to make out a prima facie case of a reduction in value resulting from a cause of a permanent nature, that the comparison ought to be with the circumstances which established the value of the hereditament at the time of the quinquennial valuation, and that, therefore, a mandamus ought not to issue to the Assessment Committee to appoint a valuer.

The importance of being fully prepared to dispute the right of the Committee to raise the rateable value is illustrated by the case London County Council v. Shoreditch Borough Council (105 L.T. 515). It is apparent that in some circumstances the decision of the Assessment Committee is final, and cannot be appealed to Quarter Sessions. In the case in question the appellants, as owners of tramways in a borough, had constructed a new curve for relieving congestion of traffic, and reconstructed certain lines for electric traction. In consequence of this alteration the respondents, as overseers, raised the rateable value of the tramway lines by a provisional list to the extent of a £1,000. The appellants appealed to the Quarter Sessions

for the County of London against a general rate based upon the provisional list. It was held that as there was evidence before the Assessment Committee of alterations in the hereditament, the question whether they had rightly come to the conclusion that such alterations had resulted in an increase of value, was not one which could properly be raised on appeal to the Quarter Sessions.

THE NATIONAL ELECTRICAL CODE AND BRITISH WIRING RULES COMPARED.

BY FRANK BROADBENT.

(Concluded from page 122.)

"Snap" switches are not manufactured in this country in sufficient quantities to justify extended reference to the National Code regulations concerning them. On general points the rules follow the lines laid down for knife switches. The leakage surface is to be not less than 3/64 in. between supporting screws and live parts; conducting covers must be lined with an insulating material not less than 1/32 in. thick. The test is 50 per cent. current overload for switches rated below 10 amps., and 25 per cent. overload for larger sizes. A duration test is also specified, viz., 6,000 "makes" and "breaks" at a rate not exceeding 10 times a minute.

The rules for circuit breakers are generally similar to those for knife switches in so far as they are

applicable.

It is not quite clear what is the overload test for breakers, the rule reading as follows:—"must successfully operate three times with two minutes intervals intervening without incapacitating the breaker, the conditions of testing current to be as given in the following table:—

Current rating of breakers.	dro	entage of v p in test ci h rated cur flowing.	rouit	Minimum available capacity of supply system, not including overload capacity.
0 to 100	•••	2	•••	1,000
100 ,, 300	•••	3	•••	3,000
300 , 400	•••	4	•••	4,000
400 500		5	***	5.000

No filing of contacts or other repairing of the

breaker to be done during the tests.

This rule leaves something to the imagination, and one may suppose that it means a short circuit test, the resistance of connecting leads representing the cable resistance which might be in circuit under the conditions of actual service. On this basis let us see what the overload current would be in a given case. Take the case of a 500-ampere breaker on a 500-volt circuit. The voltage drop with 500 amperes passing will be 5 per cent of 500, or say 25 volts, hence the resistance in circuit equals 25/500=0.05 ohm. A short circuit would therefore permit of the passage of a current equal to 500/.05 or 10,000 amperes, which is 20 times the capacity of the breaker. But, working on this assumption we arrive at the same value, 10,000 amperes, for every circuit breaker rated above 100 amperes when used on any voltage. It is desirable to have the exact meaning of this test-made clear for the benefit of British manufacturers.

On the question of cables and their erection the National Code rules are in some respects more stringent than ours, the following being some of the points of difference. Whilst our Institution rules permit of the use of hard wires having a section equal to that of a No. 18 S.W.G. (.0018 sq. in.) the National Code minimum size is No. 14 B. & S. (.0032 sq. in.) or about the equivalent of our No. 16 S.W.G. Hard stranded wires must be soldered before fastening under clamps or binding screws. Where cables pass through walls, timber, or partitions, a conducting bush, such as an iron pipe, long enough to pass through the hole in one continuous

piece is to be used, the ends to be bushed with an insulator.

We have no exceptional rules relating to the quality of cable insulation to be used for open wiring, but the National Code prescribes wires having an approved rubber, slow-burning weatherproof, or slow burning insulation.

On wood casing or conduit installations the National Code does not permit joints or taps except in approved fittings, and the wire is to be in continuous lengths from fitting to fitting. Threading is not allowed, the complete conduit system must be first erected and the cables drawn in afterwards. Not more than four two-wire or three three-wire circuits to be drawn into one conduit. Our Institution Rules do not impose any limit, but the Edinburgh Corporation rules specify that not more than four wires are to be drawn into one tube. This is a very sensible regulation and is more stringent than the National Code which as shown above allows

eight or nine wires.

As in hard wires, so in flexible and fitting wires the National Code is more stringent than our rules are, the minimum section allowed by the former being the equivalent of a No. 18 B. & S. (.00127 sq. in.) against the equivalent of a No. 22 S.W.G. (.0008 sq. in.) allowed by the Institution for flexibles, and 3/25 (.0009 sq. in.) for fittings. Such differences as exist in the rules regarding erection are largely accounted for by the differences in character of the constructional work dings, e.g., "frame" buildings, typ typical buildings, e.g., of American constructional methods, are practically unknown in this country. A very important rule in the National Code is that which insists on the bushing of all pipe outlets where they enter junction boxes, distribution boxes and the like. Our rules only ask for the bushing of "free ends" of conduit and it is unfortunately not the practice to bush the pipe ends where they enter boxes and fittings. If this were the common practice it would remove one of the two weak points in conduit work, the other being internal condensation. Whilst "sharp bends and elbows" are prohibited by our rules there is no limit as to the number of bends which may be used in one pipe circuit, or say between draw-in boxes. The National Code imposes as a limit the equivalent of four quarter bends not counting the bends at the outlet, and specifies that radius of any elbow shall not be less than 3½ in. It is no doubt owing to the extraordinary height reached by American buildings that a limit is set to the unsupported vertical length of cables run in conduit, the length ranging from 35 ft. in large sizes to 100 ft. in small sizes. The method of support may be a right-angle turn in the conduit system or by insulating supports in junction boxes. As regards the earthing of conduit the National Code does not differ materially from the Institution rules, but it allows earthing to gas pipes on the street side of the meter, a practice distinctly prohibited by the Institution rules.

Concerning cables, the Institution rules, whilst of a more or less general character, laying down the conditions to be fulfilled rather than a detailed manufacturing specification, are more detailed than in the case of switches and other accessories. This is quite understandable when we consider the important functions of the cable and the fact that it is generally concealed and practically inaccessible when once erected. The National Code on the other hand, besides being much more specific and comprehensive in regard to the installation of cables, devotes considerable space, almost 20 pages; to details of construction and the tests to be applied.

According to our Institution rules all covered copper conductors having a greater section than No. 14 S.W.G. (.005 sq. in.) must be stranded, but there appears to be no limit imposed by the National Code nor is there a standard given for conductivity

corresponding with our E.S.C. standard which is

the standard adopted in our rules.

According to the American Code the copper for insulated solid conductors of No. 4 B. & S. (.2043 in. diameter) and smaller must not vary in diameter more than .002 in., and larger solid wires must not vary more than I per cent. from the standard, whilst the E.S.C. standard permits a variation of 2 per cent. from the standard conductivity, an allowance of 1 per cent. for tinning and an allowance of 2 per cent. for the lay of the wires in stranded cables (excepting the centre wire). The National Code stipulates that solid wires shall have a conductivity of not less than 97 per cent. of that of pure copper, and that the conductivity of the individual tinned wires of a stranded cable shall be not less than the The table starts at No. values given in the table. 14 B. & S. (.0641 in. dia.) with 97 per cent. conductivity which decreases by .2 per cent. for each successive reduction in gauge until No. 30 (.01 in. dia.) is reached when the conductivity is 93.8 per cent. There is an allowance of 1½ per cent. permitted between the nominal circular mils. of the strand and the sum of the individual circular mils. of the wires.

The labels on the coils must indicate the maximum voltage for which the cables are to be used, the name of the manufacturer, the month and year when manufactured, the class or grade, and the words "National Electrical Code Standard."

There are 8 grades or classes referred to, each to comply with definite specification and to pass

prescribed tests.

The classes are: (1) rubber covered, (2) slow-burning weatherproof, (3) slow-burning, (4) weatherproof, (5) flexible cord, (6) fixture wire, (7) conduit wire, and (8) armoured cable. The requirements are much too long to give in full and are too detailed to permit of condensing satisfactorily. The pressure tests for rubber cables differ materially from ours which prescribe the application of 1,000 volts for half-a-hour after 24 hours immersion. The National Code tests vary with the thickness of insulation thus for thicknesses up to 3 sixty-fourths of an inch the test pressures are 3,000 volts a.c. per 64th. But for greater thicknesses the pressure per sixty-fourth gradually decreases as the thickness increases until a thickness of sixteen 64ths is reached for which the pressure is 28,000, or 1750 volts per 64th. The test is to be made on 1 ft. of cable after 72 hours immersion, and is to start with 3,000 volts a.c. for 5 minutes, to be increased by 3,000 volts at 5 minutes intervals until rupture of the insulation occurs. In addition to this, every complete length is to be tested after 12 hours immersion by the application for one minute of an a.c. voltage varying from 1,500 volts for a thickness of insulation of three 64ths up to 3,500 volts for a thickness of & in. The insulation test follows this, the test pressures ranging from 4,000 volts to 17,000 volts being approximately 2½ times the maximum working pressure, the insulation ranging from 100 to 600 megohms, in the 1,500-volt cable and from 200 to 1,200 in 7,000-volt cable. These figures are much lower than is the recognised practice in this country for V.I.R. cable, where the 600 megohm grade ranging from 600 to 1,250 megohms is required on voltages up to 250 and the 2,500 megohm grade ranging from 2,500 to 4,500 megohms on higher voltages within the limits of medium pressure, viz., 650 volts.

In addition to the foregoing test any completed length may be tested at any time during 30 days immersion in water and must show not less than 50 per cent. of the I.R. registered—after the 12 hours immersion. All tests are based upon a temperature of 60 degrees F. and a multiplier is given for temperatures ranging from 50 degrees to 85 degrees.

A stretching test is also prescribed which is in-

teresting, and something of this nature would form a useful addition to our own rules. For thickness of insulation less than five 64th in. a test piece is to be stretched to 2½ times its normal length at the rate of 12 in. a minute and immediately released, when it must return to not more than 125 per cent. of its original length. It must also stand stretching to 3 times its normal length before rupturing. For test pieces from thicker insulation the limits are 2 and 2½ respectively instead of 2½ and 3 as specified for the thinner insulation. The tensile strength is to be 400 lb. per sq, in. It would surely be a very poor sample of new cable which failed to pass the stretching tests imposed. Cable tested at any time within one year of the date of manufacture must pass a less severe stretching test than the foregoing namely about, twice instead of 2½, and 1¾ instead of 2.

We have still not finished with the tests, for five chemical tests are specified, viz., acetone extract, alcoholic potash extract, chloroform extract, ash and and total sulphur, and the sum total of the results shall not exceed 80 per cent. by weight of the total compound. This synopsis covers only the first of the eight classes of cable enumerated, but sufficient has been said to indicate generally the kind of conditions and tests to which cables are subjected, and those who are sufficiently interested in the other

sections are referred to the Code itself.

The requirements as to steel conduit, in addition to those referring to erection, cover standard sizes and thickness, finish, bending tests, etc., and also interior lined conduits which notwithstanding the late Mr. F. Bathurst's strenuous advocacy, have never gained a secure foothold in this country. The National Code does not recognise slip socket at all, and their conduit appears to be much thicker and heavier than ours. As the American sizes are denoted by their internal and British sizes by external diameters, comparison is somewhat diffi-cult. The smallest American size is rated as $\frac{1}{2}$ in. conduit, although the internal diameter is .62 in., whilst the smallest British standard is § in. conduit, this being the outside diameter. The minimum this being the outside diameter. American thickness is .1 in. for ½ in. conduit, and the British is .064 in. for the $\frac{5}{8}$ in. size; and for a 2 in. which is the largest standard British size the thickness is .092 against the American .15 In order to arrive at the internal diameter of British standard conduit (E.S.C.) this being the really important dimension, it is necessary to deduct twice the thickness from the outside diameter,, and as the diameters are given in fractions and the thicknesses in decimals this cannot be done without a preliminary conversion.

The following tabular comparison shows the wide divergences in the practice of the two countries, and serves to explain another of the causes of the high cost of wiring in the States. In the table the letter "B" means British and "A" American standards. Owing to the fact that the British standard is based

COMPARISON OF AMERICAN AND BRITISH CONDUIT.

on the external, and the American on the internal diameter it is impossible to compare two pipes of the same nominal size, moreover neither the internal nor external diameters of the American conduits

correspond with the nominal rating, thus what is called a ½ in. conduit measures .62 in. internally and

.82 in. externally and so forth.

Many more interesting comparison might be made between the respective practices of the two countries, particularly in the matter of wiring accessories, but sufficient has been said to indicate that whilst in some respects the National Code is more stringent than the British, the differences do not give any greater security; and further, that considerable modifications in details will have to be made in certain British manufactures if it is hoped to obtain a greater share of the Canadian trade. There is little doubt that in some respects the regulations will be modified during the forthcoming revision, but it is doubtful if any modifications which may be made will have for their object the bringing about of a closer degree of uniformity with British practice; they will be made more with a view to cheapening the cost of conduit wiring lest perchance some new and cheaper system should threaten it.

A MERCURY RECTIFIER LOCOMOTIVE.

According to the Electric Railway Journal, the Westinghouse (co. has been trying for some months a motor car provided with the Westinghouse-Cooper Hewitt mercury are rectifier becomotive equipment. This consists of a step-down transformer for 11,000/1,200 volts with secondary taps for varying the pressure; two single-phase rectifiers, one being reserve; four D.C. motors of 1,000 H.P. total capacity, and the necessary; control expectation rectifier exists a capacity.

control apparatus, rectifier-exciter, etc.

The equipment is installed in a car belonging to the Pennsylvania Railway, and was first tried on the Westinghouse test track at Pittsburgh. Later to obtain service conditions it was transferred to the electrical zone of the New Haven Railroad and is now running on the New Canaan branch of that company. After preliminary trials it was put into revenue service, hauling trains, and to date has been operated more than 20,000 miles. Its present schedule calls for a daily mileage of 240. These tests were designed to demonstrate the durability of the equipment under general service conditions, such as sustained high voltage, voltage fluctuations as well as mechanical shocks. high voltage, voltage fluctuations, as well as mechanical shocks vibrations.

The fundamental parts of the equipment and the circuit connections are shown in the accompanying diagram. Current is drawn from the 11,000-volt overhead contact wire through the drawn from the 11,000-volt overhead contact wire through the standard pantograph of the New Haven Railroad. It flows through a line switch and the primary winding of a lowering transformer to the rail return. The transformer secondary is provided with a centre tap and with a number of others equally spaced two by two from the centre on both sides to permit the varying of the A.C. voltage from zero to the maximum. The centre tap connects with the terminal of a group of four motors connected permanently in series-parallel. These motors are standard Westinghouse No. 308, wound for 600 volts. The group is grounded at the centre to limit the D.C. voltage between any point in the equipment and ground to 600. The group is grounded at the centre to limit the D.C. voltage between any point in the equipment and ground to 600. The outside secondary transformer terminals connect to the two positive electrodes at the top of the rectifier. The remaining connection is from the mercury or negative terminal of the rectifier to the other terminal of the motor group.

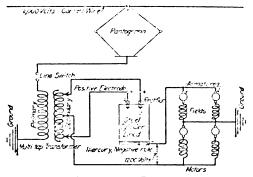

DIAGRAM SHOWING LOCOMOTIVE RECTIFIER ARRANGEMENT.

The rectifier consists of a light steel cylinder container approximately of 20-in. diameter and 36-in. in height. proximately of 20-in, diameter and 36-in, in height. The electrodes enter at the top of the container through airtight insulating bushings, projecting a short distance into the cylinder. The are is started by means of a small motor-generator exciter. No external reactance is needed on the D.C. side, as the motors furnish ample reactance for the purpose of steadying the current. That they do so is indicated by the fact that they operate as well on the rectified current as on that supplied from a rotating machine. The voltage drop in the rectifier is about 25 volts, practically regardless of the magnitude of the current, so that at say 750 D.C. amp., which is about full load The eleccurrent, so that at say 750 D.c. amp., which is about full load

for the motors, the power loss is 182 kW. and the efficiency, at 1,200 volts, is very high.

Details of the cooling system, electrodes, exciter connections, etc., are not yet available.

The rectifier weighs but a few hundred pounds, and the motor car complete weighs 72 tons. The rectifier equipment is mounted in the baggage compartment and occupies, with the switch groups and transformer, not more than one-half the floor area. the floor area.

WAR ITEMS.

Manufacturing Works in Germany.—The general meetings of the leading manufacturing companies in Germany have now taken place, but beyond the extraordinary speech which was delivered by Dr. Walter Rathenau, and to wnich attention was recently drawn, very little information of importance has been allowed to transpire. In the case of the Siemens-Schuckert Works Co., which is a private company owned by the two firms indicated in its title, no annual assembly is necessary or is held in public, but Dr. von Petri, general director of the Schuckert Co. of Nuremberg, informed the shareholders in the latter company at the recent meeting that the works of the Siemens-Schuckert Co. in Berlin and Nuremberg had rapidly accommodated themselves to the conditions of war and were sufficiently well employed, activity in the war departments in particular being considerable. At the assembly of the A.E.G. it was mentioned that the turnover in the year ended last June amounted to £26,000,000, as compared with £22,000,000 in the preceding year, and that the trade with hostile countries represented £4,750,000 of the former total. The orders invoiced to domestic consumers and neutral countries by October 31st 1911, amounted to £65,000, whilet the value Manufacturing Works in Germany.—The general meettries represented £4,750,000 of the former total. The orders invoiced to domestic consumers and neutral countries by October 31st, 1914, amounted to £6,250,000, whilst the value of the orders then on hand reached £15,500,000, exclusive of £6,500,000 held by subsidiary companies in hostile countries on June 30th, the outstanding debts in the countries being £1,000,000. As to the degree of employment in the first four months of the new financial year, it was explained that realizated in working hours, this bere the relation of being £1,00,000. As to the degree of employment in the first four months of the new financial year, it was explained that, reckoned in working hours, this bore the relation of 2 to 3 as compared with the equivalent term in 1913. The Siemens and Halske Company, although acknowledging a material reduction in the orders on hand for articles of peace, stated that the works were sufficiently occupied as a result of the abundance of orders allocated by the military and naval authorities. Speaking generally, it was submitted that as one-third of the workers in trade, industry and agriculture had been called to the colours—that is by the first week in January—it might be expected that a general reduction in the output of one-third would take place, and that the profits would be curtailed to a similar extent. Apart from the manufacturing companies, the electricity supply works are also suffering from a diminution in the consumption of energy for lighting and power purposes, except in those cases where firms are engaged on the production of war materials; and with the increasing scarcity of raw materials, especially metals, it is probable that the degree of activity in manufacturing and in the supply branch will tend to decline further, particularly when it is taken will tend to decline further, particularly when it is taken into consideration that small pecuniary payments are being offered in certain districts for the recovery of spent and live cartridges, shells, etc., which may be found in the field.

cartridges, shells, etc., which may be found in the field.

Prospects in China.—Dealing with the war's effect on trade in South China, the United States Consul at Hong Kong calls to mind that for some time past all railway and industrial undertakings of magnitude in China have depended upon foreign loans for realisation. Loans for such purposes in China in the near future will be out of the question, and there is, therefore, little likelihood of any railway work of magnitude being carried on perhaps for years to come, other than that already arranged for. A similar prospect is ahead for all important public works. In founding industrial establishments, such as electric lighting plants, there will be a similar restriction, although it is hoped that enough Chinese capital may be enlisted in certain directions to lead to some development of the most it is hoped that enough Chinese capital may be enlisted in certain directions to lead to some development of the most promising undertakings. It is likely that one result of the war will be a marked change in the course of railway and similar concessions in China. The general machinery of trade, of course, has been interfered with greatly. While German and Austrian firms continue to do business in the open ports of China, the restrictions placed upon dealings between them and British, French and allied firms are such as to make trade almost out of the question. In Hong Kong German houses have been allowed to continue business by special licence of the Government to the extent of liquidating contracts made previous to the opening of the liquidating contracts made previous to the opening of the war, but they are not allowed to enter upon any new contracts. The result is that their business organisations are tracts. The result is that their business organisations are being destroyed, their employés are idle, and in many cases have of necessity been discharged, their Chinese connections are being broken up, and in general the whole machinery of trade is being badly crippled. Many of these German and Austrian firms are important factors in the trade with and Austrian in this are important factors in the trade with the United States, and their embarrassment is materially affecting American interests concerned in Hong Kong trade. Not only is an unusual opportunity for building up new business afforded by the collapse of trade machinery under the war, but, as stated, this same collapse has thrown out

of employment many men of long experience and established connections in various lines of import and export business whose services would be of the greatest value to new concerns attempting to establish connections in the trade. The services of such men might be had at the present time far more reasonably than under other circumstances, while their knowledge of the held of trade here and in other countries, of buying and selling connections,, and of the trade generally, is something that can be acquired only by years of service. years of service.

The War and German Cables .- The fact that the German The War and German Cables.—The fact that the German submarine cables were cut by the British navy at the beginning of the war is keenly telt in interested circles on the other side of the North Sea, the two cables connecting with the United States having been severed off the Azores as early as August 5th. Professor Meister, of the Munster University, westphalia, who recently delivered a lecture on the "English Cable War," stated that owing to the English policy of destruction Germany has been isolated from all ex-European telegraphic trattic in a way that would not have been regarded as possible prior to the war. It will therefore be necessary, in his opinion, for that country to protect itself in the future by the adoption of a systematic policy for the prevention of such isolation. For this purpose policy for the prevention of such isolation. For this purpose he declares that all that/is required is a single direct American cable from the United States to Germany without any can cable from the United States to Germany without any intermediate landing place, which would belong to the United States and which Great Britain would guard herself against cutting. The Professor thinks, however, that a sater scheme would be for the establishment of an American-owned cable between the United States and a neutral country, as, for instance, Denmark or Sweden, and thence onwards to Germany. At any rate, it is considered that a solution must be reached as soon as possible by the creation of a German world's cable system which would be independent of that of Great Britain. As to the objection that submarine cables could be replaced by wireless stations, Professor Meister remarks that it is also possible to destroy the latter in time of war, as in the case of the stations at Togo, the Cameroons and in East Africa, whilst the wireless system in the present stage of science is unable to afford a complete substitute for submarine cables, which now, as in the future, must act as a complement of the former.

now, as in the future, must act as a complement of the former.

The Position in Austria.—A little light on the situation of affairs in Austria is thrown by the report of the United Electricity Co., of Vienna, for the year 1913-14. Although solely occupied as an industrial company since its supply works were acquired by the Vienna municipal council a year or so ago, the company is yet interested both in supply and manufacturing undertakings in Austria-Hungary, and it is to the statements made in regard to these that attention might be directed. In the first place, it is mentioned that the activity of the supply companies in question is being detrimentally affected by the effects of the war, inasmuch as the sale of energy for lighting and power purposes has taken a downward course, while on the other hand a large decline has occurred in the traffic on the electric tramways and railways served by some of the companies. The question as it applies to the manufacturing companies, however, is of greater importance. The report states in this connection that with the exception of certain contractors for the electrical firms has greatly diminished in consequence of the extraordinary limitation in the orders placed by public authorities and private undertakings, as well as through the total cessation of the export trade.

Trade War Exhibition.—A concerted effort on the part of

the total cessation of the export trade.

Trade War Exhibition.—A concerted effort on the part of representative business men to further the campaign for the representative business men to further the campaign for the capture and retention of enemy trade, was inaugurated at the Mansion House on January 21st, when Sir William Bull, M.P., presided over the first meeting of the General Advisory Committee of the National "Trade War" Exhibition. The exhibition, which it is proposed to hold in London at an early date, will include a display of goods manufactured in Germany and Austria, and exhibits of British goods by which they can be superseded. There will also be lectures and discussions dealing with subjects of interest to manufacturers and traders. An executive committee has been elected, and Mr. F. H. Payne was appointed Organising Commissioner. All communications should be addressed to the Organising Commissioner, National "Trade War" Exhibition, Central Hall, Westminster, S.W. A public appeal is to be issued for a £10,000 guarantee fund.

Recruiting Tramcar at Rochdale.—An illuminated tram-

Recruiting Tramcar at Rochdale.—An illuminated tramcar, gaily set out with patriotic devices and coloured lights, arranged by the Tramways Committee of the Rochdale Corporation in conjunction with the Parliamentary Recruiting Committee of Rochdale, to assist in the work of securing men for the army, has been out for service on various routes for a week and has been well patronised. The additional receipts have almost paid for the cost of the decorations and illuminations. The car is to be kept in service for another fortnight at the least.

A Rochdale Problem Reconsidered.—The Rochdale Tramways Committee has reversed a decision which had been arrived at respecting an application from a man who, before the war, was training for service as a conductor, and who, since war was declared, has joined the colours. By a majority of one vote, as reported in our columns two or Recruiting Tramcar at Rochdale.—An illuminated tram-

three weeks ago, the Committee had decided that the man in question, was entitled to the half-pay which the Committee had granted to men who were on the staff before war was declared and who have since joined the colours. At a meeting of the Committee on January 20th, it was legally ruled that the man was not an employé when war broke out, and the previous decision to grant him the half-pay was residented.

Electric "Fall In."—At the request of the Chief Recruiting Officer for London (Captain Passingham) metropolitan borough councils which own electricity works are to have illuminated electric recruiting signs for night use affixed to the standards of street lamps in their districts, intimating to men of military age the nearest recruiting stations in the various localities in the metropolis.—" Standard."

Telegraphists at the Feart

"Standard."

Telegraphists at the Front.—On Friday last Colonel A. M. Ogilvie, Second Secretary of the Post Office and Director of Home Signals, unveiled a handsome scroll containing the names of 447 telegraphists who had left the Central Telegraph Office for active service. The Controller of the Central Telegraph Office (Mr. J. Newlands) presided, and stated that the scroll was a gift of the girls of the department. Over 500 telegraphists have left the office, and more are to follow. The total number of men serving with the colours is now over 30,000, of whom 4,000 are from the telegraph force.

Bradford Employés and the Relief Fund.—The complete list, to date, of employés' contributions to the Bradford Lord Mayor's War Relief Fund includes those of the employés of the Corporation Electricity Department, eighteen contributions, £167 6s. 8d.; of the tramways workers, sixteen contributions, £759 10s. 10d.; and of Messrs. C. Pratt & Sons, Ltd., electrical contractors, twenty contributions, £155. The total contributions of Bradford Corporation employés to the fund have amounted to over £5,000.

Edinburgh Tramwaymen.—Since the commencement of the war 300 men of the Edinburgh and District Tramway Company's service have joined the different units of the army. In the case of married men who have joined the forces the company have made up the difference between Government allowance and full wages, and in the case of single men the company are allowing each man 10s. per week. Up to date their allowances have cost the company nearly £2,000.

L.C.C. and Alien Firms.—The Stores and Contracts Committee of the London County Council reports that, as the result of inquiries with regard to firms controlled wholly or largely by enemy aliens, whose tenders or quotations had been accepted by the Council, it has decided to have no further dealings with 28 such firms, and their names have been removed from any lists of firms to be invited to tender for the supply of stores, etc.—"Times."

Australia and Enemy Trading.—The "Times" states that the High Commissioner for Australia has received advice from the Commonwealth Government that Consular certificates of origin will be required in respect of all goods shipped to Australia from places situated in Norway, Bradford Employés and the Relief Fund .-

vice from the Commonwealth Government that Consular certificates of origin will be required in respect of all goods shipped to Australia from places situated in Norway, Sweden, Denmark, Holland, Switzerland, and Italy, on and after February 1, 1915.

German Trade.—Referring to the Board of Trade Exchange meeting recently noticed in this column, the Stone-bridge Electrical Co., Ltd., of Willesden, write to say that they supply small milliampere-meters and pocket voltmeters such as were exhibited, but of much better finish than the latter.

Stockport Tramwaymen.—Some slight curtailment of the tramway services has had to be made at Stockport owing to the fact that 71 employés in the department have left to join the colours, and that it has not been possible to fill

join the colours, and that it has not been possible to fill up their places.

Siemens' Employés' Contributions.—The employés of Siemens Bros. Dynamo Works, Ltd., Stafford, have sent £62 7s. 11d. to the Mayor's National War Relief Fund, the sum being five weeks' contributions.

Personal.—Owing to the exigencies of the work of the Woolwich Electricity Department, the B.C. has not granted Mr. E. Mawdesley, assistant engineer, permission to enlist in a combatant capacity in the Army.

Mr. W. J. Leeming, electrical engineer to the Buxton U.D.C., has had his services accepted by the Government, and will be attached to the Royal Engineers.

Professor Alfred Schwartz, of Redcliffe, Orpington, Kent, informs us that by deed poll dated 20th January, 1915, he formally renounced his surname of Schwartz and assumed the surname of Barnes (the maiden name of his great-great-grandmother on the paternal side—Elizabeth Barnes, 1731), and adopted the name of Schwartz as a forename and addition to his Christian name of Alfred, and intends henceforth to describe himself on all occasions and for all purforth to describe himself on all occasions and for all purposes as Alfred Schwartz Barnes.

Roll of Honour.—Private William Millan, of the High-

Roll of Honour.—Private William Millan, of the Highland Light Infantry, who was employed in the office of the Scottish Central Electric Power Co., Falkirk, has died from enteric fever while in training at Troon.

Sergt. Alec. Evans, of the Cheshire Regiment who was formerly with the Potteries Electric Traction Co., was killed in action near Chapell on October 27th.

Private Fred Ashcroft, up till recently an employe at the Westinghouse Works, Trafford Park, has been killed in section.

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the fullowing week. Correspondents should forward their communi-cations at the eurliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Advertising and Character.

With reference to Mr. Turner's letter in your issue of 22nd inst., I must congratulate that gentleman (an American by "instinct"—whatever that means) on his subtlety in extracting a personal compliment from what was intended to be a

ing a personal compliment from what was intended to be a statement of a difference in temperament, but, logic, surely, should prevent him saying, as he does in effect, that because A is fat and B is thin therefore A is a wise man.

To appreciate the distinction I tried to draw, not offensively, I can only suggest that your correspondent should compare the selling methods of a West End tradesman with those of a New Cut coster. It may be quite true that Bill Sykes of the New Cut, who is a monogamist by "instinct" and a temperance advocate, is far superior to William Sykes, Esq., of Oxford Street, who is neither, but Bill has an unfortunate habit of screaning his wares.

screaming his wares.

I do not like "screams."

"Mr. Contractor! If you're alive, get busy! right now!"

E. J. Reed.

London, S.W., January 22nd, 1915.

Evidently I did not make myself clear in my former letter,

Evidently I did not make myself clear in my former letter, as Mr. Herbert Berry has missed my meaning. I stated that "an advertisement should reflect the character of the firm issuing the announcement." What I intended to convey was that the "style" of the advertisement, that is, its appearance, should be in harmony with the advertiser's business. The same applies to a great extent to the text.

For instance, methods of advertising which would be applicable to a turbine maker might be ineffective if adopted by a manufacturer of electrical accessories, such as fittings, ceiling roses, etc. In other words, the advertisement should be designed to appeal to the buyer of the goods advertised. Mr. Herbert Berry says the two are opposed. I would like to know in what way? It seems to me that the two are identical.

By no means is it impossible to appeal to the various sections of buyers in turn—to "ring the changes," as Br. Berry calls it—and to retain the same general "style" throughout the entire series of advertisements.

To keep changing from one type of display to another means the risk of losing one of the most valuable advantages of advertising, viz., cumulative effect, which really means "good-will." In a manner, you may liken this to a firm which changes its name frequently. With the adoption of the new title they have to inform all concerned of their action, and this frequently leads to mistakes and invariably means that a certain number of customers are lost. The analogy may be a poor one, but I think Mr. Berry will see my meaning.

title they have to inform all concerned of their action, and this frequently leads to mistakes and invariably means that a certain number of customers are lost. The analogy may be a poor one, but I think Mr. Berry will see my meaning. Of course, there are lots of men who read their technical papers away from office when they are free from the distractions of the day. It is at such times that the advertiser stands the best change of securing attention for his proposition. Now if you put in a cartoon which is really and truly funny, you may get the reader to laugh until his sides ache, but the point is, is he amused with the joke, or is he interested in the goods? After all, the idea back of the advertiser's mind is to interest the prospective buyer in what he has to sell, not to amuse him. The latter can be left to Punch and other papers catering for the reader's entertainment. Granted that the cartoon is looked at and appreciated, is there not a great danger that the richness of the jest will overshadow the message the advertiser wishes to convey and drive home? I think so. Surely, it is better to attract attention by more serious methods, and, having gained the reader's eye, and, shall we say, sympathies, endeavour to interest him in what we have for sale; our steam engine, dynamo, switchgear, fuses, or whatever it happens to be. Is not this a more logical, and far less risky way of proceeding?

Of the postcards, etc., to which Mr. Berry refers, I can offer no opinion as I have not seen them, but as I take it that most of this matter is sent through the post, and addressed to firms and individuals, it seems to me that these hardly come within the scope of the present discussion which, up to the present, has been confined to technical paper publicity.

Circularising in any form is quite different to Press advertising. Both are but links in the selling chain which connects the seller with the buyer. When the two are used with discrimination, and in conjunction, then are the best results obtained.

And now for a

And now for a word with Mr. A. M. Turner. It is essential And now for a word with Mr. A. M. Turner. It is essential for the writer of technical advertisements to have an acquaintance with technical phraseology and the customs of the engineering trade. At the same time it is not a sine qua non for the advertising man to be a past expert in the goods or apparatus he is advertising. There is a vast difference between the commercial man who knows his subject and the technical expert in the works, or test room. As a rule, the latter men know infinitely more about their subject than the individuals who sell it. The advertising expert designs his announcement with the object of creating a bias in the mind of the reader, or of getting him to put himself in touch with the advertiser. A maker of expensive plant, such as steam sets, or complete electrical equipment, would draft his advertisements with the object of increasing his reputation. Such a one could not expect to receive a big bunch of enquiries, for the simple reason that there are but few buyers in the market at any one time for apparatus such as I have mentioned. Orders are not placed every day for plant or equipment which may run into several thousands of pounds. On the other hand, the advertiser of wiring accessories, electric light fittings, and such like, would be well advised to frame his advertisements with the object of getting direct enquiries. And there are advertising service agents who are able to give this specialised service to engineers and other technical advertisers. The advertising trade is very much the same as any other. Some firms give good service, others — Many agents devote themselves to a speciality: motor-cars, patent medicines, foods, garments, etc. And it is the specialist who is able to give the best service because of his accumulated experience.

With apologies for the length of this epistle, The advertising expert designs his announcement with the

With apologies for the length of this epistle,

Contracts with Alien Enemies.

It may interest your commercial readers to know that the Chamber of Commerce have seriously taken in hand this

question.

The legislation required would roughly cover the determination or suspension of executory contracts with an enemy by way of a written order by the Secretary of State or the Board of Trade. The portion of the contract which has already been performed, of course, would be unaffected. When the matter has duly gone through the Chamber of Commerce Parliamentary Committee, and the other necessary steps have been taken, the practical step will be a deputation to place before the Government the commercial view of this matter, when it is hoped the Attorney-General will, in accordance with his promise, give the matter immediate attention, and, one trusts, incorporate the same in the Bill for next session.

T. W. Cole.

London, S.W., January 22nd, 1915.

Garage Heating.

I should like to record my appreciation of the Editors' footnote to my correspondence published in your issue of Jan. 8th under the above heading, and also for the reply of your correspondent "P. 6817." I must confess it appears that I have somewhat over-estimated the risk existing with petrol vapour, but I always understood that petrol vapour under certain conditions in air formed a mixture ignitable at a very low temperature. The lamp arrangement suggested by your correspondent I have utilised myself for temporary conditions, but always felt that it was not a safe method, owing to igni-

but always left that it is the triangle brickwork tion risks.

By "garage," I had in mind the usual single brickwork building with wooden doors, such as is usually adopted by private car-owners, and I fully appreciate that such buildings are somewhat expensive to keep heated owing to the bad heat insulating qualities of the roof and walls, and the generally had fitting doors, etc.

bad fitting doors, etc.

I am afraid, even though every precaution were taken to felt the interior and protect against draughts, that it would be a somewhat expensive matter, even with current at ld. per unit, to heat the whole garage sufficiently to prevent damage to the upholstery, etc., and that it would be difficult to compete with slow-combustion stoves or externally-heated

the tweet apparatus.

I have received several makers' catalogues illustrating heaters which they claim to be satisfactory for "garage" heating, but it would appear that they have not been carefully designed for the sole purpose they are intended for, and seldom is provision made for earthing, which is surely necessary where 200 volts and above is only available, and this from a public

supply.

I must apologise for taking up so much of your valuable space, but I am confident it is a subject that interests a good many, and reliable data and information must be useful to others besides—

Interested Inquirer.

Salaries of Junior Engineers,

Having read the remarkable effusion by "Experienced" in last week's ELECTRICAL REVIEW, I am filled with mingled feelings of amusement and disgust. It is quite apparent to the average shift engineer that the writer cannot be experienced in the working of a public supply station with a capacity exceeding 100-kw exceeding 100-kw.

He states in his letter that the station superintendent and his assistants are responsible for the efficient working of the station. Now what I would like to ask "Experienced" is: Who are the station superintendent's assistants but the shift

engineers? Of course, by that statement he absolutely gives

himself away

As for his remarks re card playing, if he had ever had charge of a shift in a modern power station he would know that frequently, if he managed to find time to eat a meal in comfort during his shift, he would be lucky, especially during the winter months.

The letter is quite clearly absurd to those acquainted with modern station practice. I have only troubled to answer it for the benefit of those not so acquainted who might form mistaken ideas as to the true value of the long-suffering shift engineer. One of Them.

Judging from his remarks relating to the duties of shift engineers and others in a modern generating station, your correspondent "Experienced" has apparently forgotten the prefix "In" to his nom de plume.

correspondent "Experienced" has apparently forgotten the prefix "In" to his nom de plume.

Why confine the recreations of the shift engineer and switchboard attendant to card-playing? Surely the introduction of a piano in the engine-room, with a few comic songs by the switchboard attendant accompanied by the shift engineer, would relieve the monotony of "nap" and "cribbage," whilst a gramophone in the boiler-house would be a welcome addition to all the other automatic plant, including mechanical stokers, which require so little (?) attention.

It would perhaps be advisable to remind "Experienced" that a station equipped with the most recent automatic and labour-saving devices requires most careful and skilful opera-

labour-saving devices requires most careful and skilful opera-tion, and any really good station superintendent will admit that he places ar more confidence in the skill and intelligence

of his staff that in all the automatic gear in the works.

The remarks of "Experienced' on this subject are far too facetious to be taken seriously, and the remainder of his letter appears to consist of a rather personal attack on Mr. Ebben, who—whatever his views upon the subject under the above heading—is not afraid to append his right name to his correspondence.

A few years spent in the running of a well-equipped electricity works would probably induce "Experienced" to modify his views, and he would then be in a better position to choose what appears at present a most unsuitable pseudonym. W. E. Plowman.

London, January 23rd, 1915.

Referring to your correspondence column of the 22nd inst. regarding salaries of junior engineers, your reader who signs himself "Experienced" appears to be very rude. Some of his remarks, however, should not be allowed to go unchallenged.

Take the gist of his statement, that very little required by shift engineers, switchboard attendar Take the gist of his statement, that very little skill is required by shift engineers, switchboard attendants, and others to run central station plant. I think this remark is most ridiculous and unworthy of the publicity of your valuable columns. He states also in language very annoying to all station men, that it is chiefly by "rule of thumb" methods that the running of station plant is conducted.

Perhaps he could instance the rule of thumb methods of procedure for the following:—A fracture on a "live" steam main, a hot bearing, or an "earth" on the field circuit of a loaded alternator?

I could enumerate many like instances where that method

I could enumerate many like instances where that method would be a failure, also, I am as well assured that he would never take the responsibility of his "steady, experienced driver" in these cases, as I am assured that Mr. Ebben is no Hyde Park orator.

Hyde Park orator.

And, speaking of Mr. Ebben, whom I have the pleasure of knowing personally, I can inform "Experienced" that Mr. Ebben is one of the best of good fellows and knows very well how to treat cheap abuse, which I consider the other remarks made by "Experienced" are.

The A.E.S.E. has now a very large membership, mainly due, I think, to the untiring efforts of Mr. Ebben, who must get through an immense amount of work, and this, mark you, as an honorary secretary.

Wm. Cooper. London, W., January 23rd, 1915.

"Your correspondent under the doubtful nom de plume of Experienced' is undoubtedly one of the engineer managers

Your correspondent under the doubtful nom de plume of "Experienced" is undoubtedly one of the engineer managers referred to in the very excellent letter of Mr. W. J. Ebben which you published in your columns a week or two ago. Of course, it is not for me to guess as to whether "Experienced" in his young days was one of those "with brains and liked work," and so obtained his promotion, or whether he had capital and influential friends behind him to boost him up, but the fact remains obvious that "Experienced" has much to learn respecting the running of electricity stations.

His statement in comparing the abilities of the engineer-incharge and the engine-driver is more than sufficient to condemn his own capability to write letters on such a subject. The engine-drivers of my experience hardly know the difference between the dynamo and the switchboard, so that far from practically taking charge in time of trouble, they are more in need of someone to take charge of them. The majority of drivers are nothing more than stokers who have "had brains and who liked work," and have been promoted to the rank of driver. I should very much like to know exactly

what can be learnt in the way of dealing with short-circuits, earths, and break-downs, etc., from the boiler-house. "Experienced" had also something to say about the "collar and cuff" engineer's amusements to while away his shift. Chargeengineers of my experience have more than sufficient to do in the way of work to occupy the whole of their time, and at the same time have to take the full responsibility of whatever the same time have to take the full responsibility of whatever occurs. It is absurd for your correspondent to state that the "collar and cuff gentleman" takes orders from the driver, more especially in such a case as a fault, either electrical or mechanical; indeed, it is extremely doubtful whether the average station superintendent or engineer-manager could get things in order without "the collar and cuff gentleman," considering that they just casually stroll around during the day it is not expected that they could do otherwise. Moreover, the college-trained man is in close touch with everything in boiler-house engine-room and on switchboard, and thing in boiler-house, engine-room and on switchboard, and knows exactly where and how things are, and also how they

ought to be.

"Experienced" also states that owing to "rule of thumb" methods very little skill is required by shift-engineers, switchboard attendants and others as the regulating is "done by automatic apparatus." If your correspondent's experience has taken him so far as automatic gears he will know that they are far more complicated than the hand regulation methods, whether electrical or mechanical. Can "Experienced" tell us what part the "steady driver" would play in the event of this automatic gear going wrong? And as for the station superintendent and his assistants maintaining and taking the responsibility for the efficiency of this part of the works, I quite fail to see how he can do so if the mishap occurs when he isn't about, and where his responsibility lies. I suppose the "collar and cuff gentleman" awaits his coming before doing anything in the matter. In conclusion, I must say that in my opinion it is such men as "Experienced" who are the stumbling block of many smart juniors "with brains," but without the money and influential friends to find them good positions.

Collar and Cuffs. good positions. Collar and Cuffs.

I have been requested by the Bradford Branch of the A.E.S.E. to forward the following for insertion in your correspondence columns:—
W. J. Ebben, Hon. General Secretary, A.E.S.E.

London, N.E., January 25th, 1915.

If "Experienced" will kindly read his ELECTRICAL REVIEW for January 15th again, he will see that Mr. Ebben did not write the letter he objects to. Mr. Ebben was asked to forward the opinions of the Yorkshire members of the A.E.S.E., of which the Bradford Branch is the centre, to the Press, and

of which the Bradford Branch is the centre, to the Press, and he did so.

The facts and opinions as published are not grievances of the aforesaid members, but were put forward to draw attention to the "Situations Vacant" column of January 8th. Will "Experienced" kindly look out that number and deny the truth of the statements made on January 15th, if he can? He admits that a few shift engineers and others are badly paid; that is not as it should be, but to say that those with brains who like work will undoubtedly get promotion makes one wonder how he obtained his present berth, and makes one sorry for those unfortunates who occupy subordinate positions under him and have to exist on less than an unskilled labourer's wages.

Further along he tells us that "rule of thumb" methods and very little skill are required by station engineers, etc., etc. Will "Experienced" kindly tell us who are the station super-

Will "Experienced" kindly tell us who are the station super-intendent's assistants, and if the shift engineers and switch-board attendants are not usually hoping to hold that exalted position some time in the future? We thought "rule of thumb" methods had passed away with the Victorian Era; and that all the best practical and scientific means were adopted to obtain the most efficient and economical plant to fill our modern power stations. We think "Experienced" has not read his ELECTRICAL REVIEW week by week or he would know better.

"Experienced" has not read his ELECTRICAL REVIEW week by week, or he would know better.

Will he tell us why one-third of the station engineers should be compelled to work for less than a labourer's wage when it usually costs the former rather more for house rent, food, etc., for himself, his wife and family than it costs the labourer?

Take the staff in a 25,000-kw. capacity station we know of, as follows:—One station superintendent, one assistant superintendent, five shift engineers, and 25 switchboard attendants of various grades. How many years will it be before a switchboard attendant of the middle grade reaches the post of station superintendent, and what will become of the other twenty-four?

twenty-four?

If "Experienced" can solve that problem he will find

work upon when next he takes up h very good argument to work upon when next he takes up his

It is an undoubted fact that we cannot all be station supers. or managers or foremen, but that is no reason why the younger should be badly paid.

"Experienced" gives himself away altogether; he is not an engineer, his "rule of thumb" proves that; and then he shows he is not a Trade Unionist, and we very much doubt if he has ever heard a "Hyde Park orator." He is an interesting study, and his letter will not keep the A.E.S.E. members who are well paid from trying to lift up those who are not so fortunate. so fortunate.

I have read with regret your "Experienced" correspondent's abuse of Mr. Ebben and the A.E.S.E. I am not a member of the A.E.S.E., neither do I know Mr. Ebben, but I have followed his good work and observed its progress since its inception. I hope the organisation will continue on its successful way. There are many questions to be considered before one can ascertain the cause of bad working conditions in central stations. They are generally caused by an inexperienced man being placed in authority, by a weak chief, who is easily overcome by a plausible tongue, yet strong enough by surrounding influence to retain his position. One never hears of bad feeling in a well-disciplined station, and the working conditions are always better.

Chief engineers should thoroughly examine their candidates

of bad feeling in a well-disciplined station, and the working conditions are always better.

Chief engineers should thoroughly examine their candidates before engaging them, because testimonials are not to be relied on. I have known of men writing their own, signed by the chief, at his request. I have also known of time-expired apprentices receiving testimonials which would do credit to chief assistants, just to get rid of them.

The system of working apprentices and other boy labour on shift work is an abominable system, and yet it is practised by a few of the smaller municipalities—under the nose of the Factory Inspector. Of course, it brings the working costs down to a minimum when there is an experienced man to superintend their working. In some such stations, boys fresh from school are put to work the board and even drive the engine and fire the boilers, and this in stations up to 1,500-kw. capacity. These apprentices blossom forth as electrical engineers, when, as a matter of fact, they are merely qualified to drive an engine or look after a switchboard. And yet this is the type of man we see pushed into supply stations to superintend others at a low wage, which he can increase by the pernicious method of using oil to his superior. The apprentice system requires rooting out. We can never get rid of the "swelled head," "something-out-of-nothing" variety of engineer who holds the reins and glories in being glorified, but by united action we might make things more comfortable.

Anti-Oil.

I am pleased to see that the question of the salaries of junior engineers has cropped up again, and that it is being regarded as a question on its own, apart from any other. I have been disappointed that ere now someone with an able pen has not thanked Sir John Snell for his remark on the subject, which remark really set the ball rolling. Mr. Ebben made a passing reference in his letter, but I think a straight "Thank you, Sir John," would have been more fitting, and was due. was due.

I would like to draw attention to the first six lines in the second paragraph of the letter of "Experienced." He, in a letter which seems to indicate a man somewhat tyrannous, admits there are badly-paid men, in a FEW cases. I would suggest that he is referring to his own particular area, and think that elsewhere he would find another "few," and yet others. He points out that the smarter of these are qualifying for better positions. They are certainly trying to do so; but brains need books and little experimental ventures, too, to

brains need books and little experimental ventures, too, to develop them, things which cost money, even if the books be second-hand. The money cannot be squeezed out of 30s. a week, and we have not all got fathers with long pockets to find it for us.

He further says that station work is now largely a "rule of thumb" affair, everything being done automatically. Does he realise that each piece of automatic apparatus in a place means something else for the man-in-charge to understand, to watch, and to keep in order? Further, if that automatic, whatever it may be, fails to perform its allotted function, the "mere man" must step in and use his knowledge. He must know what to do under the circumstances, every bit as well as if no automatic means of doing it were installed.

know what to do under the circumstances, every bit as well as if no automatic means of doing it were installed.

Automatic appliances do not relieve a man one whit of his responsibility. Whatever happens, he has to answer for it. even if it be a mistake on the part of his junior, as instanced by J. Kay.

There are many things, trivial perhaps in themselves, but which, taken together, point to a lack of consideration being shown to the men, on whom, perhaps above all others, depends the continuity of supply. Especially so when it is remembered they are at it seven days a week, fifty weeks per year, including all Bank and special holidays. I wonder whether managers recollect such times. Perhaps they were more fortunate. fortunate.

I fear I mustn't trespass further on your space just now. should like to see letters from other men who know what they say, and abstain from any inclination towards abuse or ridicule, which seem to me to be against our interests, even if indulged in by writers on the other side.

A Senior Assistant.

A.C. v. D.C. for Lighting.

A.C. v. D.C. for Lighting.

In my opinion as a practical electrician who has installed and handled both alternate and direct lighting jobs, chiefly in factories and works where the conditions were anything but favourable, owing to heavy vibration, dampness or excessive heat, and often in very close positions, I have no hesitation in recommending direct current at about 240 to 250 volts in preference to alternating at 110 volts or any other volts in preference to alternating at 110 volts or any other

The chief trouble with the A.C. supply is that you have always two live wires to contend with at the point of entry into a room, the fixing of the usual single-pole tumbler switch to control a light or number of lights always leaves one terminal of the lamp-holder fully alive. In the case of a tubing job, where perhaps tube-end lamp-holders and bracket fittings are oftener used than pendant drops, the replacing of a lamp-holder means that everal more branch circuits must be cont

job, where perhaps tube-end lamp-holders and bracket fittings are oftener used than pendant drops, the replacing of a lamp-holder means that several more branch circuits must be cut off to enable the repair to be carried out with safety after drawing the necessary fuses.

Also, the lower voltage would exactly double the cost of installation, as it becomes necessary to double the size of cable if the voltage is reduced by one-half. The increased fragility of the 250 or 240-volt lamp as compared with the 110-volt is all bunkum; any metal filament lamp will give out if roughly handled. I have found no difference whatever between the 240 and the 110-volt lamp. In fact, in my opinion the more universally used 230 to 250-volt lamp is the best lamp, and will last longer and stand more vibration and knocking about than the 110-volt lamp. In any case, it must be remembered that lamps are manufactured specially for very vibratory positions or traction work; these lamps are known as traction lamps. The 230 to 250-volt direct-current supply has become so universal that lamp manufacturers have devoted particular attention to the manufacture of lamps of both carbon and metallic filaments for this popular pressure.

One other little point must not be overlooked, for it is very often met with, and that is, that you cannot charge accumulators from an A.C. supply without installing an expensive apparatus known as an interrupter, or by using a motor generator. A.C. supply is also useless for electroplating and electrochemical or medical purposes. A single-pole switch only is necessary when placed on the live side of a D.C. circuit to render the circuit quite dead and harmless, and this practice is universally adopted for factory and works lighting.

Commercial Relations with Germany.

At the conference of this Association, held in Edinburgh in

At the conference of this Association, held in Edinburgh in 1911, we were favoured with the presence of the representatives of many Foreign and Colonial Commercial Travellers' Associations, including the powerful organisation in Germany. To mark the occasion the honorary membership of this Association was conferred on each oversea delegate present.

I have received through the post a copy of an announcement recently published in Die Post, the organ of the German Association, a translation of which I enclose herewith.

I think this document most interesting, showing, as it does, the ignorance of the real position amongst a class of the German people who should be acquainted, if anyone outside the ruling class is acquainted, with the real facts regarding the present deplorable strife and Britain's action and part therein, and showing the intense bitterness of feeling against this country of the commercial community in Germany.

I shall be glad if you will give publicity to this pronouncement, so that your readers may have first-hand evidence ment, so that your readers may have first-hand evidence of the real mind of commercial Germany with regard to Britain. Confident as we are in the justice and right of the action we have taken, we can regard such action with the contempt it

Condent as we are in the justice and right of the action we have taken, we can regard such action with the contempt it deserves, and it will be as well in future to be on our guard against resuming the business relations which have hitherto subsisted and to give to all things German, including her commercial travellers, a very wide berth.

Fred: Coysh,

Secretary, V.K. Commercial Travellers' Association.

London, W.C., January 19th, 1915.

NOTICE.

The undersigned have decided to resign our hon, membership of the United Kingdom Commercial Travellers' Association and to return our official badges at the first opportunity. The reason that this has not been done before is that the undersigned had the opinion that after the declaration of peace commercial relations between Germany and Great Britain would be resumed, and it would thus be out of place to break off good relations with old colleagues, but the action of England against Germany in business matters has reached such a degree of hatred and low action as has never before been known under any conditions of warfare amongst cultured nations: it is evident that the idea is not only to destroy German prisoners in England, show England to be on such a low grade of civilisation that it will be many years before friendly relations can be resumed. It is therefore beneath our dignity and honour to wear an English badge.

(Signed) George Hasse, Chairman Central Board.
W. Bauer, Vice-Chairman Central Board.

War on German Trade.

We hear a good deal on the above subject, but one side that has not been given great prominence is the question of the employment of Britishers lately connected with German

Some few weeks ago a firm advertised in your columns for an engineer for the sale of cable, and added this significant sentence: "Those previously employed by German firms need not apply." I ask, is this fair? To my mind it is most unjust. In support of my view of the matter I would point out.—

1. If all firms acted in this way, then the Britisher who for patriotic reasons desired to join a British firm would be "kept at bay," and after the war would be more or less driven to rejoin the old firm.

pay." and after the war would be more or less driven to rejoin the old firm.

2. If British manufacturers will only take into their employ men previously employed by German concerns and give them salaries which will induce them to stay, the war on German trade will be considerably furthered.

3. Face the facts! German organisation has always been excellent, and largely responsible for their extensive trade. Britishers employed by German firms have a knowledge of these methods, and could undoubtedly in many cases introduce them to great advantage into some of our firms and further strengthen our position in the future.

I speak from experience obtained in the employ of leading British and German firms, but as my views are evidently not shared by the firm who inserted the advertisement referred to above, I shall be very interested to know their reason for so wording the advertisement.

Britisher.

Britisher.

German Trade with Belgium.

After a stay of three months in England, I find that of the various points touched upon by the Belgian Press, in connection with the banishment of German products, one of the most important has been overlooked. I refer to electrical machinery and apparatus. As this especially concerns the readers of your esteemed Review, and affects their interests only, you will oblige me by according to these lines the hospitality of your journal.

As many journalists and men of standing and justice have already pointed out, when we have driven from our devastated Belgium the usurping and criminal power, it will be our task to restore our country to a position at least as important as it occupied before the war, whilst casting out goods made in Germany or in other countries under the auspices of

made in Germany or in other countries under the auspices of German capitalists. It goes without saying that this will not be accomplished without a struggle, especially in the latter connection, in view of the duplicity of which that country is

Two important points, however, will ensure to us this commercial victory, which, in my opinion, is no more uncertain than that of our allied armies on the vast field of battle:—

1. Belgian patriotism, mingled with hatred for the crim-

2. The assistance that our English friends will continue to

2. The assistance that our engilsh friends will continue we accord to us.

None of your readers, makers of electrical material, is unaware, I suppose, that Germany predominates in the export of this material to all countries. This is the case with regard to Belgium, thanks to low prices, in accordance moreover with the quality of the goods, as is well enough known, and to a system which has been widely adopted for the past fifteen

system which has been widely adopted for the past fifteen years.

Now, having taken a firm resolve to banish this material from our country, how shall we accomplish it, seeing that a first necessity will be to re-establish installations in many industries at present ruined, to restore networks, and to replace gas undertakings with the latter, if the rival products are not known there or are inadequately appreciated?

I repeat that British aid will be a great asset towards victory, provided it takes shape in good time and with the necessary energy. Let your industrial leaders immediately issue an appeal to the many Belgian electricians and manufacturers at present in London, in order that in proportion as Belgium is freed your products may be brought within their reach under the most advantageous conditions.

As much in this relation as in that which concerns the system employed by Germany for the past 15 or 20 years, I place myself at the disposal of your readers, to smoothe the way that they would wish to follow.

As regards Belgian patriotism, I shall not dwell at length on this point: first, because, through modesty, I do not wish to magnify the wreath of glory won by our people at this time; and, secondly, because this quality has been proved ever since the commencement of the war.

Just as our brave soldiers, then, have been able to hold in check the first fierce onset of the German hordes, our com-

ever since the commencement of the war.

Just as our brave soldiers, then, have been able to hold in check the first fierce onset of the German horde, so our commercial world, conscious of its duty and filled with gratitude, will be able to defeat the rapacity of the German capitalists and show them, with a gesture of defiance, that their fine but deceitful words will in future have to seek other fields.

I entrust you, Sirs, with my London address, at the disposal of your readers, with compliments and thanks in anticination.

London, N.W. January 23rd, 1915.

[Several letters are held over.—EDS. ELEC. REV.]

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

E.A.C. Inching Starter.

THE ELECTRICAL APPARATUS Co., LTD., of Vauxhall Works' South Lambeth Road, S.W., have placed on the market a heavy duty D.O. inching starter, which we illustrate in fig. 1. It consists of an automatic circuit-breaker (contactor), interconnected with an otherwise plain rheostat in such a way that the circuit is always broken by the contactor, no matter how carelessly the starter is handled.

There is no hold-on coil or spring return, and by dispensing with the latter it has been possible to increase the brush pressure to give satisfactory contact and to obtain finer resistance graduation with more steps.

The rheostat movement consists of a plain lever with a superposed separate operating handle, the forward movement of which

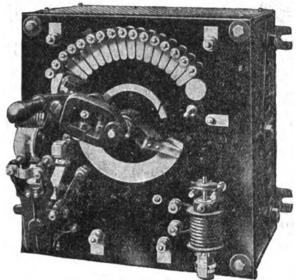

FIG. 1.—HEAVY DUTY INCHING STARTER.

latter, relatively to the lever, makes a plunger contact, energising the contactor coil and causing the contactor to close the main

circuit to the motor.

If the handle is released or drawn back, the energising circuit to the contactor is broken and the contactor opens, stopping the motor.

When all the resistance is cut out, the handle can be rele

an alternative circuit to the contactor is provided in that position.

It should be noted that the contactor opens the circuit before the rheostat lever can be moved, and that a breaking arc on the

starting segments is impossible.

The contactor can only pull up when the main lever is on the first contact, with all starting resistance in circuit; by automatically cutting in economy resistance with the closing of the contactor, the operating coil is only subjected to full voltage for a fraction of a second, and cannot be burnt out; also the inductive

spark is broken by a properly-designed switch.

These inching starters are made in sizes from 5 H.P. to 200 H.P., and in the open, totally enclosed and back-of-board types.

An Electrically-Driven Rolling Mill.

A large firm of Birmingham steel workers recently decided to lay down a new 10-in. mill for rolling steel ingots down to various

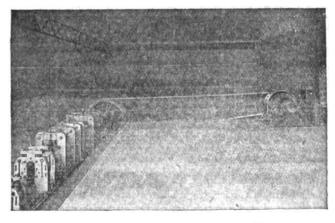

Fig. 2.—Rolling Mill with 350-h.p. Witton Motor Drive.

small sections, such as bicycle rims, &c. In fig. 2 will be seen a general view of the rolling mill, together with the driving motor.

The motor is rated at 350 H.P., and is of the "Witton" three-phase induction slip-ring type, and is started through a G.E.C. dust-tight liquid starter. Power for driving the motor, supplied by the Birmingham Corporation at 5,500 volts, three-phase, passes to a G.E.C. mistake-proof, boiler-plate motor-control panel. In addition to the usual gear this panel contains a set of choking coils to protect the end turns of the induction motor at the instant of switching on switching on.

The drive from the motor is by cotton ropes on to a 7-ton fly-wheel carried on a shaft running in self-ciling dust-proof bearings. A special feature of the installation is that provision is made fo

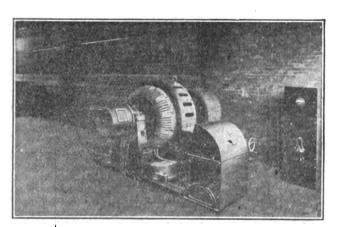

FIG. 3.—WITTON MOTOR WITH STARTER AND CONTROL PANEL.

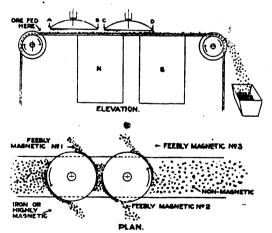

the easy adjustment of every part which, can possibly require it and everything is done to facilitate the changing of the rolls when this, is required. The mill was built by Thos. Perry & Sons, Ltd., of Bilston, and the whole of the electrical equipment was supplied by the GENERAL ELECTRIC Co., LTD., of Witton. The views were taken at a time when the motor was not housed in.

New Magnetic Separator.

THE RAPID MAGNETTING MACHINE Co, Ltd., of 18, Crescent

THE KAPID MAGNETTING MACHINE CO, LTD., of 18, Crescentive Birmingham, are introducing a new revolving disk magnetic separator (Type O), patents for which are pending, for the separation of feebly-magnetic ores.

It consists of a travelling feed belt passing successively over the poles of two vertical magnets. Two horizontal revolving domed iron disks are suspended over the belt, one somewhat in advance of the feet when the pole and the other had a pole and the other the first pole and the other between the pole axes, as in figs. 4 & 5. The rim of the first disk is magnetised sufficiently to attract iron and highly-magnetic material from the ore on the belt, and the

FIGS. 4 & 5.—REVOLVING DISK MAGNETIC SEPARATOR.

disk being of sufficiently large diameter to overhang the edges of

the belt, as it revolves carries the ore beyond the magnetic influence, when it falls off by gravity and is there collected.

A similar action occurs with the second revolving disk, which, however, is so situated that an intense magnetic field is produced in its rim actually over the poles, thus attracting the feebly-magnetic material which is deposited from the overhanging

By the introduction of extra pole-pieces in tandem with disks of suitable construction, the number of magnetic products can be increased, and by suitable arrangement two distinct products can be obtained from each disk.

The machine is provided with a number of adjustments as regard speeds, spacings, magnetic strength and ore feed, which make for greater efficiency. By setting the disks so that the edges are at graduated distances from the ore, the magnetic field can be varied to give four magnetic products.

"Ediswan" Half-watt Lamp Fittings.

THE EDISON & SWAN UNITED ELECTRIC LIGHT Co., LTD., of Ponder's End, Middlesex, have placed on the market two similar half-watt lamp fittings, one of which is shown in fig 6. These are both made in cast-iron, and are suitable alike for interior or exterior use.

FIG. 6.—"EDISWAN" HALF-WATT LAMP FITTING.

In each case there are two sizes, one accomodating standard 100, 200 or 300-watt bulbs, and the other standard 500, 750 or 1,000watt bulbs.

A simple form of adjustment to allow for varying length of bulb is provided; the fittings are water proof and efficiently ventilated; one is provided with a reflector as in fig. 6, the other is

Lektrik Ceiling Roses.

The possibilities of the ceiling rose are admirably illustrated in a new list issued by MESSES. A. P. LUNDBERG & SONS, of Pioneer Electrical Works, 477-489, Liverpool Road, N., which is devoted

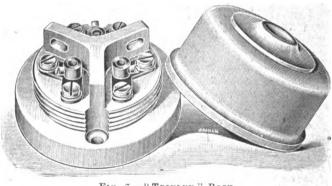

FIG. 7.—"TRIFLEX" ROSE.

FIG. 8.—"DETACHABLE" ROSE.

entirely to these accessories. Six types are shown, ranging from the "Biflex," with two terminal plates, to the "Multiflex" with six, and plug-connection patterns. In fig. 7 we illustrate the "Triflex," in which each plate has a loop-in terminal and two sorew and washer terminals. The shank of the centre terminal provides the means of fixing the plates to the porcelain base. The three plates provide for a variety of uses, amongst which may be

noted the connection of a switch to control the whole pendant, or to give three degrees of lighting with three lamps, or a series-parallel-and-off switch to give dim light or full light with two

lamps, or an earthing wire.

Fig. 8 shows a device which enables the pendant fitting to be completely removed and replaced whenever desired without

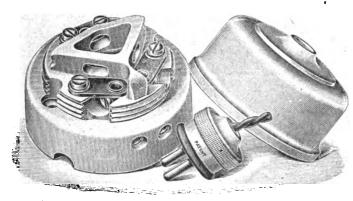

FIG. 9.—"M.I.P." Rose and Plug Connection.

detaching any screwed connections; and fig. 9 combines the advantages of a three-plate rose with a side plug connection for a small heater or motor, or other purposes—whence it is called the "Multum-in-Parvo."

Interlocking Switch Plug.

MESSES. SIMPLEX CONDUITS, LTD., of 116, Charing Cross Road, W.C., have just introduced an interlooking switch plug mounted in a c.i. box for use on conduit installations. When the plug is inserted in the socket and the switch placed "on," the dolley lies

FIG. 10.-INTERLOCKING SWITCH PLUG.

over the extended flange of the plug, so that the latter cannot be withdrawn without switching off. It is also impossible to insert the plug with the switch on. We illustrate in fig. 10 a 5-ampere flush pattern switch plug, with plain polished brass cover.

Firing in the Dark.

A quick-sight electric flashlight rifls has been invented by a famous Australian explorer. The flashlight is fitted close to the muzzle of the firearm by a simple device, and the battery is carried in the butt. The light throws a T-shaped mark, which gives an automatic aim, the bullet striking practically at the intersection of the two lines. The device can be fitted to any arm, and should be useful to the big game shooter in the dark, or as a protection against thieves in the night. The flashlight can also be used for signalling signalling.

Copper.—Returns for the half-month are now to hand. and we see from Messrs. H. R. Merton & Co.'s statistical circular and we see from Meesrs. H. B. Merton & Co.'s statistical circular that the total European visible supply is well maintained. Quantities at Havre are given as before the war, and the same course is followed with those at Hamburg and Bremen (if any). As these quantities remain fixed in the figures given, they do not affect the aspect of the increase or decrease, i.e., the increase of 876 tons during the fortnight ending January 15th is a true increase at English parts or affect thereto. English ports, or afloat thereto.

English ports, or afloat thereto.

Detailed supplies show a large quantity from Spain, equal to a month's supply previous to the war, as might have been expected after three months of short supplies from that country. Chile shipments are well over the average, Australian, so far, below it, but, from the quantity affect, likely to exceed its pre-war average on the whole month's figures. Total deliveries are higher than half those of August, October, or November, but not up to the half of last month's. This may, of course, be considerably altered by antities received during the ensuing fortnight.

LEGAL.

TRAMCAB ACCIDENT CLAIM.

A VERDICT in favour of pursuer, with an award of £150 damages, was given in the Court of Session last Friday in a case in which a woman sued the Corporation of Glasgow for £250 damages for injuries she received on one of the Corporation cars. Pursuer stated that she was proceeding along the passage on top of the car when it stopped with a violent jerk. She was thrown forward and her head went through a glass panel. She attributed fault to defenders in respect that the car was being driven at an excessive rate of speed and was not under proper control. The Corporation denied fault, and stated that the driver brought the car to a standstill in order to avoid running over a dog. The car was going at a moderate speed, and, they said, was under proper control.

A SYDNEY CUSTOMS DUTY DISPUTE.

In November, 1913, Ralph Sadlier Falkiner (trading as the Falkiner Electric Co.) imported a motor train, consisting of an engine, car, and 10 wagons. A dispute arose between the importer and the Customs Department as to the Customs classifica-tion for revenue purposes. The importer claimed that the duty should be £673, while the Customs Department claimed £4,590. Falkiner paid the duty claimed under protest, and claimed in a case heard before Mr. Justice Hood, a refund of £3,917, the difference between the duty collected and that which he held should have been paid.

MR. JUSTICE HOOD, in giving judgment at Melbourne in December, said plaintiff was entitled to judgment for the amount of duty paid in excess (about which, he understood, the parties would sgree), and costs including discovery.—Sydney Morning Herald.

WORKMEN'S COMPENSATION CLAIM.

AT Wolverhampton County Court, on Monday, before his Honour Judge Howard Smith, and Dr. H. L. Brown (West Bromwich), who sat as Medical Assessor, Hannah Simcox, widow, applied for an arbitration under the Workmen's Compensation Act on behalf of herself and her three children, the sole dependants of her husband, Thomas Henry Simcox, who, it was alleged, was killed by an accident on the Wolverhampton tramways during his employment as a motorman by the Corporation. claimed £245.

The case for the applicant was that at 10.15 p.m., on November 18th, Simcox was driving a tramcar from Wolverhampton, in the direction of Willenhall. When near Hayward's works the car left the rails. Shortly afterwards a car from Willenhall came up, and the rails. Shortly afterwards a car from Willenhall came up, and by means of a cable power was transmitted to the derailed car. While this was in progress, Simcox took up his place on the front of the car. One attempt was unsuccessful, but at the second the lights on the derailed car came on. It was seen that Simcox had assumed a stooping position, and when it was realised that he had collapsed, the current was disconnected. Simcox was moaning, and after artificial respiration had been tried without success, he was taken to the General Hospital, where he was found to be dead. A post-mortem examination was made and the conditions reinted

was taken to the General Hospital, where he was found to be dead. A post-mortem examination was made, and the conditions pointed to the fact that the man had been killed by shock.

DR. T. BLACK, formerly house surgeon at the General Hospital, said he made a post-mortem examination. He did not form any definite opinion as to the cause of death, but it was quite possible it resulted from the effect of an electric shock. He could not account for it in any other way. He discovered certain conditions which were present in cases of death from electric shock.

DR. BANKIER said he attended Simcox from October 30th to November 11th, the complaint being influenza and colic. There was no disease of the heart serious enough to cause death. Witness was present at the post-mortem examination. The dark and unclotted condition of the blocd was a condition which he understood, pointed to electric shock.

For the defence, MR. HEKEY LEA, of the firm of Lea & Son, consulting engineers, Birmingham, was called. He said that he tested

sulting engineers, Birmingham, was called. He said that he tested the car after the accident, and if the insulation had not been perfect it might have caused shock. The insulation, however, was

perfect.

DR. CHOLMELEY, who examined the body, said there was sufficient disease of the heart to cause death at any moment.

The JUDGE and DR. BROWN retired, and on returning the former said it was really a hopeless case on the applicant's part. He was advised by the medical assessor, and he agreed with him, that Simcox died as the result of the condition of the heart. Electric shock might have determined the cause, but Dr. Brown agreed with him that there was no evidence to show there was an electric shock at all. The verdict would be for the respondents, with costs.

MR. E. W. CAVE. barrister, pointed out that the Corporation had made an offer which, in his opinion, would have been handsome.

made an offer which, in his opinion, would have been handsome.

OSRAM LAMP WORKS, LTD. v. THE CORONA LAMP WORKS, LTD.

In the Chancery Division, on Wednesday, January 27th, this cas was down for hearing before Mr. Justice Warrington Mr. A. J. WALTER, K.C., who, with Mr. Colefax, K.C., Mr. J. Hunter Gray and Mr. Lunge, represented the plaintiff company, informed his Lordship that the action had been settled. Judgment by consent would be taken with his Lordship's approval, the plaintiffs being granted an injunction as asked, and the defendants having paid £1,000 to cover damages and costs.

His Lordship gave judgment in accordance with the terms of settlement.

settlement.

BUSINESS NOTES.

Smoking Concert.—On Friday. January 22nd, the staff and foremen of the Edison & Swan United Electric Light Co., Ltd., held a smoking concert at the Staff Café, Ponder's End. Mr. J. W. Elliott presided, and Mr. J. S. Child occupied the vice-chair. Mr. Sydney Warwick soted as accompanist. We understand that Mr. C. F. Warren's vocal solos were greatly appreciated, and that the humorous songs of "Little Jack," the firm's telephone exchange operator, were equally enjoyed.

Pocket Lamp Inquiry.—Inquiry has been received for the names of United Kingdom manufacturers of cases and bulbs for electric pocket lamps, also for small polished steel reflectors. Communications should be addressed to the Secretary, British Chamber of Commerce, 9. Rue des Pyramides, Paris (Ref. G.W. 1,116).—Board of Trade Journal.

Trade Announcement.—Messes. Fyfe, Wilson and Co., of Glasgow, have opened a London office at Broad Sanctuary Chambers, 11, Tothill Street, Westminster, S.W., for the sale of their Kelvin petrol and parafin engines and electric generating sets, "Quartowatt" heaters, &c. Mr. A. G. Tucker, who has been with the firm in Glasgow for a considerable time, will be in charge of the new office and but telephonoments will be the control of the cont of the new office, and his telephone number will shortly be "6921 Victoria "

Liquidations.—THE ALTHEAT Co., LTD.—This company

is winding up voluntarily, with Mr. A. Slatter, 62, Oxford Street, W., as liquidator. A meeting of oreditors is called for February 1st.

The Universal Radio Syndicate, Ltd.— This company is winding up voluntarily, with Mr. F. A. Walrond, of 38 to 41, Queen Anne's Chambers, Westminster, S.W., as liquidator. A meeting of creditors is called for February 4th.

THE UITENHAGE ELECTRIC LIGHT & POWER CO.—A meeting will be held at 71A, Queen Victoria Street, E.C., on February 22nd, to hear an account of the winding up from the liquidator, Mr. E. West.

THE ELECTRICAL STORES, of Nottingham, write to point out that they have no connection with the Electrical Stores, Ltd., of Wolverhampton, which was referred to in our last issue. The former concern is a private partnership, not a limited company.

THE SANDWICH, DEAL AND WALMER ELECTRICITY SUPPLY Co., LTD.—A meeting will be held at 36, Castle Street, Dover, on February 27th, to hear an account of the winding up from the liquidator, Mr. R. Mowll.

BRITISH PROMETHEUS Co., LTD., Salop Street, Birmingham.—

A Receiver for the debenture-holders has been appointed.

Book Notices.—Our valued contemporary La Revue Electrique, which published its issue for October 16th, 1914, on January 15th, states that it hopes to be able to appear regularly benneforth, and remarks on the distinct revival in scientific and industrial activity that coincided with the end of 1914. The contents consist of articles prepared for use in September, and include one by M. J. Blondin on telephotography and telephoty, in which recent apparatus are described. We welcome the return of the Remark to more normal conditions and confidently hope that its the Revue to more normal conditions, and confidently hope that its career will never again be interrupted from such a caus

German Cable Manufacturing.—A fresh development is in contemplation by the conversion into a joint stock company of the Norddeutsche Kabelwerke—an undertaking which was formed by the Mix & Genest Telephone Co. about four years ago, with a capital of \$15,000. The share capital of the reconstituted company, which bears practically the same title, amounts to £75,000, of which the Municipal Council of Neukölln, where a aris, too, of which the municipal council of reductin, where a new factory is in course of erection, is reported to have subscribed £15,000. It is proposed to extend the scope of the company's manufactures, including the production of rubber core cables, and when the factory is finished it will be possible to turn out all the manufactures of a modern cable works.

Catalogues Wanted for India.—Messes. Greaves, COTTON & Co., who are opening a branch of their electrical department in Karachi, invite our firms to send catalogues addressed to them at Karachi, India.

Patent Application.—Mr. L. Brennan, C.B., has applied for restoration of Patent No. 26,034 of 1909, for "Improvents in means for imparting stability to unstable bodies.

Bankruptcy Proceedings .- W. Walker (D. Smith and Co.), dealer in electric lamps, 2 and 3, Red Lion Court, Fleet Street, E.C.—Last day for proofs for dividend February 6th. Mr. E. S. Grey, Official Receiver, trustee, Bankruptcy Buildings, W.C. W. R. Wedge, Albion Place, Northampton, lately carrying on business as electrical engineer in the Arcade, Northampton.—At

the Northampton Bankruptcy Court, on Tuesday, the examination

was adjourned sine die.

A. WHITELEY, electrical and mechanical engineer, Llandudno.—
First meeting. February 5th, at Crypt Chambers, Chester. Public examination, May 4th, at Bangor.

Calendars and Diaries.—Messes. Hayward-Tyler and Co., Ltd., of 99, Queen Victoria Street, London, E.C., have sent us one of their usual pocket diaries for 1915. In addition to daily diary space there are some pages of engineering memoranda relating to water supply matters, and illustrated particulars of the firm's pumping machinery.

From the Hyatt roller-bearing department of MESSES. BROOM AND WADE, LTD., High Wyoombe, Bucks., we have received a scrap of card illustrating their bearings. When opened it turns out to contain a tiny calendar for 1915.

MESSES. TOY & WINSLOW, of 58, Stockwell Road, Brixton, S.W., have sent us a deak calendar with monthly slips.

Catalogues and Lists.—Messrs. Landis & Gyr, Ltd., Elgee Works, Stonebridge Park, Willesden, N.W.—Leafiet illustrating and giving connection diagrams of double tariff meters, with clock and hand control.

with clock and hand control.

MESSES. LACY-HULBERT & Co., LTD., 51, Victoria Street, Westminster, S.W.—Four new leaflets briefly describing, illustrating and giving prices of "Boreas" air compressors, electric air compressors, electric blowers and rotary blowers.

THE BENJAMIN ELECTBIC, LTD., 1A, Rosebery Avenue, London E.C.—Four new sectional publications in attractive and serviceable form. No. 500 gives particulars and prices of "Marbella" opal reflectors of the distributing and concentrating types; No. 501 renectors of the distributing and concentrating types; No. 501 (24 pp.) details numerous Benjamin lighting specialities, such as wireless clusters, Edison screw devices. lampholders. &c.; No. 503 (16 pp.) is devoted to a number of reflectors and fittings for shop window, show-case, and cornice lighting; No. 502 is a 40-page pamphlet entitled "Economical Industrial Lighting;" and it gives full information concerning the Benjamin steel line of reflectors and reflector fittings designed for this class of illumination services. All of the publications are fully illustrated, and have the prices

set out very clearly.

MESSER. SIMPLEX CONDUITS, LTD., 116, Charing Cross Road,
London, W.C.—16-page electric heating list containing illustrations
and prices of a range of Plexsim luminous radiators, from one to six lights, Murray's patent radiators, the Plexeim electric heat projector, and various designs of convectors operating upon the Sim-

plex strip system.

MRSSBS. CROMPTON & Co., LTD., Chelmsford.—Leaflet describing their "D" pattern portable moving coil instruments, ammeters, voltmeters and combined volt-ammeters, and giving prices of same.

MESSES. PASS & SEYMOUR, INC., Syracuse, U.S.A.—Price leaflet in three languages giving particulars of "Shurlock" electric

MESSES. THOMAS MITCHELL & Sons, Ltd., Derby Street, Bolton.

—100-page catalogue of the stock of second-hand machinery, boilers, engines, electrical plant, &c., that they have available.

MESSES. JULIUS SAX & Co, LTD., 24A, High Street, New Oxford Street, London, W.C.—16-page catalogue of electric bell and lighting accessories, Holophane glassware and fittings.

Norway.—The Tinfos Electrical Iron Works, which are the only exporters of electric pig-iron in Norway, have lately had a number of inquiries from abroad for the material and, in fact, for more than the works are able to produce. To Danish motor manufactories and foundries the company has lately sold 1,700 tons of electric pig-iron, and 350 tons to other countries. The company has also practically secured an order for 500 tons for Italy.

Private Arrangements .- Spagnoletti, Ltd., electrical engineers, Goldhawk Road, Shepherd's Bush.—The creditors of the above were called together last week at the offices of the liquidator, when it was stated that the meeting had been held in pursuance of the provisions of the Companies' (Consolidation) Act, the shareholders having passed a resolution for the voluntary liquidation. The liquidator stated that the company was regisliquidation. The liquidator stated that the company was registered in August, 1907, with a capital of £20,000, there being no public issue. In October, 1907, there was a debenture to the extent of £10,500 issued, and a further issue of £2,000 general charge, including the freehold land and buildings at Goldhawk Road. Another debenture was issued in December, 1913, in favour of the London County and Westminster Bank. The real object of the company going into voluntary liquidation was to get rid of the present, name of Spacycletti and reconstruct the company. The company going into voluntary liquidation was to get rid of the present name of Spagnoletti and reconstruct the company. The sale of the whole of the assets had been concluded, and the business had been taken over by the Park Royal Engineering Works, Ltd., who would continue the business. The trade liabilities would be paid in full and the creditors would probably each receive a cheque in settlement before the end of the present month. No resolution was passed, and the voluntary liquidation will, therefore, remain in the hands of the present liquidator. present liquidator. (Continued on page 149.)

THE EDISON & SWAN ELECTRIC LAMP WORKS.

FIRMS may come and firms may go-but few of us can remember when the Edison & Swan Co. came into existence, for from the earliest days of electric lighting the name of

this firm has been a household word, and none of us is likely to see it go, if we may judge by its present activity; long may it flourish, and worthily may it continue to bear testimony to the splendid work accomplished by the two great pioneers whose names it proudly bears! Ill fortune has dogged the steps of many of the old firms which laid the foundations of the electrical industry, and not a few of them have suc-

MOUNTING CARBON FILAMENTS FOR "EDISWAN" LAMPS.

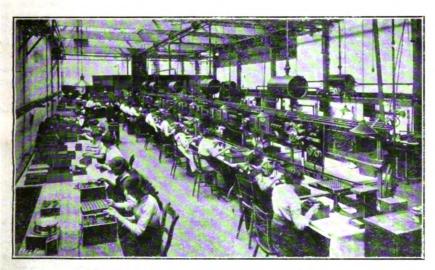

cumbed to the assaults of competition or the canker of internal disorders; the "Ediswan" company itself has not escaped the trials of adversity, but it has survived all perils, and

J. W. Swan and T. A. Edison, in this country were amalgamated, and the manufacture of incandescent electric lamps was commenced under their joint patents. During

the reign of the carbon filament, the "Royal Ediswan" lamp acquired and maintained a reputation second to none, and the firm established branches in many provincial towns, as well as in the British Colonies and South America. On the introduction of the tungsten filament a few years ago, the firm took up the manufacture of the new type of lamp, first with the pressed or squirted filament, and later with the drawn-wire fila-

ment, and achieved equally satisfactory results.

It is a remarkable fact that, in spite of the high efficiency of the tungsten lamp, the demand for the carbon-

FLASHING AND CHECKING CARBON FILAMENTS.

EXHAUSTING TUNGSTEN LAMPS,

now, with undiminished energy and renewed vitality, it appears to have entered upon an era of prosperity unsurpassed

in its previous career.

SEALING DRAWN-WIRE AND CARBON LAMPS.

The firm was established in 1883, with a capital of one million sterling, when the interests of the two inventors, filament lamp has suffered but little diminution, and consequently on a recent visit to the works at Ponder's End, we found the carbon lamp department busily employed, the

PHOTOMETER ROOM.

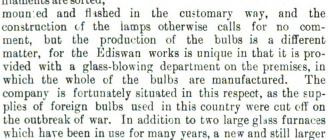

output from this branch amounting nearly to half the total output of Ediswan lamps. The question has often been

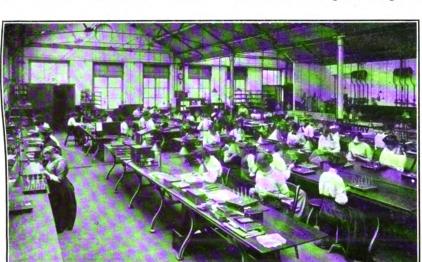

asked—who uses carbon lamps nowadays? The reply is that wherever lamps are exposed to rough usage, shocks, and vibration, the carbon lamp, which can be turned out at one-quarter the cost of the tungsten type, is still the most economical; the filaments are able to withstand an extraordinary amount of hard knocks, and the cost of renewals is comparatively trifling. Thus, carbon lamps are still employed on warships, at collieries, and on some railways, and for portable lanterns on ships, in workshops, &c.

The processes involved in the manufacture of incandescent lamps are now so familiar to our readers that we need

not describe them in detail. In the Ediswan works we saw great quantities of cellulose filaments being squirted, hardened and dried, passed through dies to render them uniform in diameter, and carbonised; bearing in mind the length of filament in a lamp, and even allowing for a large percentage of waste, the amount of filament material prepared affords some idea of the enormous output of the works. filaments are sorted,

WINDING AND MOUNTING METAL FILAMENTS.

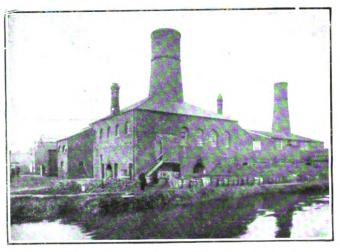

the halves of a mould which is quickly closed by a boy helper, and blows it out in the mould whilst rotating it, so that the joint of the mould leaves no mark on the bulb. The latter is withdrawn in a few seconds, ready for use. The workman displays remarkable skill and judgment in taking exactly the right quantity of glass and manipulating it so that the thickness of the walls is uniform. The largest bulbs for high-C.P. lamps are made in a similar manner, but the operation is longer and more difficult, requiring two heats.

The whole of the process of glass-making is carried on in

the works, from the raw materials -chiefly sand and red lead-of which an abundant supply is available; the output of bulbs, already numbering some millions per annum, will be greatly increased by the addition of the new large furnace, but we understand that the whole of it will be absorbed by the Edison and Swan works. The construction of the glass furnaceswhich somewhat resemble pottery kilns in shape—and the mode of setting

and heating the "pots" in which the glass is melted and refined, are exceptionally interesting features of the works; the pots, for which a special quality of fire-clay is used, are made and set by the expert staff of the company. The pots as well as the furnace have to be heated to a high temperature before the setting takes place, and the operations carried on under such arduous conditions make heavy demands upon the skill and endurance of the manager of the department and his assistants.

Returning to the lamp-making works, we watched with

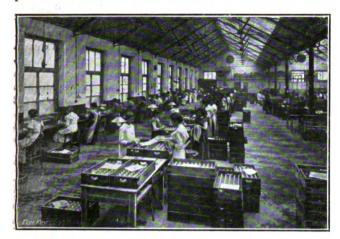

EXTERIOR AND INTERIOR OF "EDISWAN" GLASS WORKS.

one, with 12 pots, has recently been built and put in operation; the original small furnace with which the company commenced its glass-blowing operations—more than a quarter of a century ago—has also been brought into use again after a long period of idleness. The process of making a bulb is perhaps the most interesting of all the operations connected with lampmaking; yet it is exceedingly simple—to the spectator. The workman dips an iron tube into the pot of molten glass, which we believe is called "metal," and withdraws it with a glowing lump of plastic glass on the end; after blowing it out a little, swinging and spinning it, he inserts it between

interest the drawing of tungsten wire through diamond dies to the smallest sizes, and the subsequent processes of shaping, winding and mounting the filaments, which follow the usual lines. Besides the ordinary standard lamps, a variety of special types are manufactured by the company, from the tiny lamps for telephone switchboards to lamps of the highest candle-power. Various improvements have been introduced by the staff, whose prolonged and unique experience must be of the greatest value to the company, many of the experts having been associated with the firm almost from the commencement of its operations. The lamps are tested at various stages of manufacture, and the

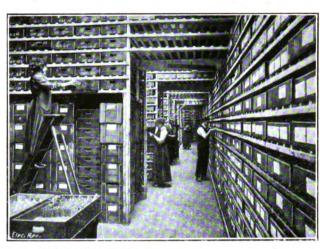

photometer rooms are exceptionally well equipped, the pentane lamp being used as the ultimate standard of reference.

Even where the bulbs have been of British manufacture, it has been a common practice to import the vitrite and brass caps; this company, however, has made itself independent of foreign aid in this respect also, by installing machinery for the manufacture of the caps, so that every part of an Ediswan lamp is entirely British made. The

THREE-PHASE PLANT AT ASHTON-UNDER-LYNE.

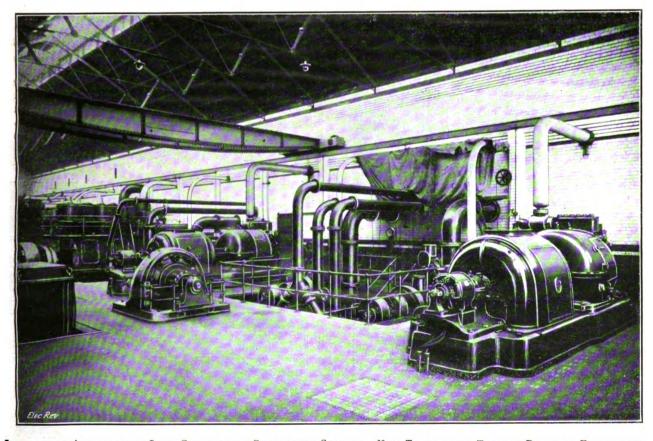

DURING the last few years electricity supply has made great headway in the industrial and manufacturing areas of this country. This is particularly true of the Lancashire cotton manufacturing districts, in which the demand for greater

FINISHING DEPARTMENT AND STOCK ROOM AT "EDISWAN" WORKS.

accompanying illustrations show some of the departments of the lamp works; but the company, in addition to lamps, makes a variety of instruments, switchgear, heating apparatus, &c., and its other departments are working at high pressure in the execution of important contracts. Owing to the needs of the Government, which have absorbed a large proportion of the company's products, the effect of the war has been not to reduce, but to redouble the activity of the works, facilities in the matter of electric driving in mills and factories has led to a very general adoption of three-phase generation and distribution on the part of the municipal electricity suppliers in the vicinity of such works.

New three-phase power stations are springing up and others are projected, while the same type of plant is making its appearance, even in small areas where a power load is in prospect.

INTERIOR OF ASHTON-UNDER-LYNE CORPORATION GENERATING STATION. NEW THREE-PHASE TURBINE PLANT IN FOREGROUND.

and every effort has been and is being put forward to cope with the extraordinary demand for Ediswan manufactures; the buildings are being extended and additional machines installed for this purpose. The employes number about 2,500. In expressing our thanks to the directors for the opportunity

In expressing our thanks to the directors for the opportunity of visiting the works, and to the staff for the kindly courtesy with which we were shown the various processes, we add the hope that the present prosperity of the company may be maintained not only during the war, but also into the distant future.

In many of the smaller industrial centres, the domestic lighting load, under present conditions, offers little scope for development, and the acquisition of a power load is the best means of placing the supply undertaking on a firm basis, and thereby improving the conditions of supply all round.

As an example of work carried out on these lines, we may refer to the recent developments in connection with the Ashton-under-Lyne Corporation electricity undertaking.

Digitized by Google

In 1910 when the question of extensions was being considered, it was decided to start a three-phase alternatingcurrent supply, and for this purpose a Willans exhaust steam turbine coupled to a 400-kw. Peebles alternator, and a 400kw. Peebles motor-alternator were installed.

The area up to that time had been supplied on the three-wire directcurrent system and the Willans turbine operates on the exhaust steam from three Browettdirect-Lindley current sets, and in conjunction with an Allen countercurrent jet condenser, with a capacity of 25,000 lb. of steam per The conhour. densing water is passed through a Blasberg cooling tower of 125,000 gallons per hour capacity.

The installation of this plant took all the available space in the then existing buildings, and, further plant being required, a large extension

scheme was put in hand, and has been in use for some months. This comprised a boiler house to hold five 9-ft. diameter Lancashire boilers, with Goodbrand economisers and a chimney to deal with the gases from ten boilers; the

3,000 VOLTS

THREE-PHASE OIL EWITCH CUBICLES ON GALLERY.

boilers are equipped with Sugden superheaters and Triumph machine stokers, the hoppers of which are supplied with coal by small Bennis elevators - one to each boiler. elevators are fed from a 1,000-ton coal bunker facing the boilers, and pass up over the firing floor to spouts leading to the stoker hoppers, this arrangement being similar to that adopted in the original boiler plant.

The coal elevating and conveying plant for filling the bunkers was supplied by Messrs. R. Dempster & Sons.

As there is no natural source of water on the site, all the water for condensing and boiler feed purposes is pumped from a borehole, some 500-600 ft. deep, being subsequently

treated in a Kennicott water softener of 5,000 gallons per hour capacity, and passed to the cooling-tower plant. The feed water is drawn from the jet condenser discharge on its way to the cooling towers, and passed through a feed heater - into which the pump exhausts are turned -prior to passing through the economisers. Two 6,000-gallon Nichols steam feed

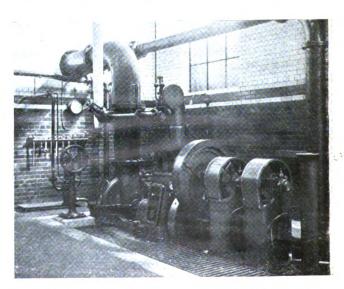

pumps form part of the new extension.

An addition was also made to the engine-room building, in which two 1,500-кw. В.Т.Н. three-stage Curtis turbines running at 3,000 R.P.M. steam at 145-lb.

pressure are installed, each driving a three-phase alternator for supplying 3,300-volt, 50-cycle current and a direct-coupled 16-kw. exciter. The cooling air for the alternators is passed through Balcke dry air filters in the

THREE-PHASE H.T. CONTROL BOARD, ASHTON-UNDER-LYNE.

The condensing plant is installed in an open well between the two turbine sets, each of which exhausts into an Allen counter-current jet condenser, the steam-driven pump set in connection with which consists of a 65-H.P. Allen tandem compound engine driving a centrifugal extraction pump and a geared two-throw air pump.

ONE OF THREE SIMILAR ALLEN CONDENSING PLANTS AT ASHTON-UNDER LYNE.

To economise space in the engine room, the condensers have been erected in the boiler house, into which the main exhaust pipes are led.

The condenser bodies are cylindrical in shape, of riveted steel, and provided with internal perforated steel trays to insure intimate mixing of the steam and water. Each condenser is supplied with a butterfly valve and float for

Digitized by GOOGIC

controlling the quantity of injection water and to safeguard against flooding of the condenser and turbine should the

water extraction pump fail.

The air pumps are of the single-acting Allen-Edwards type, speed 150 R.P.M., driven through a cast-iron spur wheel and paper pinion on the engine shaft, which runs at 500 R.P.M. The centrifugal water extraction pumps are arranged to deliver over the top of cooling towers.

These condensing plants are similar to the earlier one provided for the exhaust turbine set, and will deal with 25,000 lb. steam per hour, giving a $27\frac{1}{2}$ -in. vacuum with condensing water at 80° F. The centrifugal pumps are each rated at 115,000 gallons per hour, and to meet the further requirements of this plant a Davenport cooling tower was installed, of similar size to that previously mentioned.

As an additional link between the alternating and directcurrent plant, a 500-kw. Westinghouse six-phase rotary converter is installed, speed 750 R.P.M., together with a 550-kw. transformer, the whole of the three-phase plant being controlled by B.T.H. oil switchgear installed in a

recess on one side of the engine room.

This H.T. switchgear consists of an operating board standing slightly above engine room floor level, with the oil switches, two sets of bus-bars, &c., in cubicles mounted on The oil switches are designed to break a gallery above. 10,000 kw. safely, and are mechanically operated. operating board of the usual B.T.H. type includes panels for the three turbine sets and four feeders; an interconnector panel for the bus-bars fitted with a Tirril regulator; and panels for the motor-alternator and rotary converter.

Our views give a good idea of the new three-phase plant, and some indication of the original engine-room, with a modern 500 kw. Belliss direct-current set conspicuous in the background. Amongst the consumers on three-phase supply are cotton mills, rubber works, cake factories, a colliery, &c., which are supplied both by underground and overhead mains, the contracts for which have been carried out by the British Insulated & Helsby Cables, Ltd., and the Mackintosh Cable Co.

At the present time the three-phase load is increasing rapidly, as the following figures indicate:-

One week. December.	General supply.	Tramway supply.	Three-phase supply.	One week. Total.
1913	44,315	34,850	18,537	97,702
1914	44,698	32,329	83,478	160,505

As to the effect of the new plant on the operation of the station, it is worth noting that the coal consumption per unit delivered to the mains has fallen from $5\frac{1}{2} - 6$ lb. to 3.70 lb., the latter figure representing a cost of 198d. per unit (with coal at about 10s. per ton); the generating costs as a whole are about 43d. per unit.

The full load steam consumption of the new turbine sets on test was 16.3 lb. per unit, and erected on site under normal working conditions on two-thirds load, including steam range and auxiliary engine losses, amounted to 18.05 lb. per unit.

The extensions as a whole, buildings and plant, have cost some £37,000, equivalent to £10.1 per kw. of generating

plant installed.

For the particulars and figures which we quote, we are indebted to Mr. Neville Appelbee, the electrical engineer to the Corporation, on whose advice the introduction of three-

phase supply has been carried out.

That his anticipations have been amply realised, may be gathered from the fact that the growing demand on the station points to the necessity of installing another turbine set almost immediately, which will have a larger output than the existing ones, and will take the place of some of the earlier reciprocating plant.

In conclusion, our thanks are due to Mr. Appelbee for so readily assisting us in the preparation of this short

article.

Fire.—A Reuter dispatch from Trenton, New Jersey, states that damage to the tune of £200,000 was done by a fire which broke out on January 19th at the plant of John A. Rebling, Sons & Co. The company was making insulated wire for telegraph and telephone field service and trace chains for artillery. Incendiarism is suspected.

BUSINESS NOTES.

(Continued from page 144.)

Catalogues Wanted in Spain.-Firms dealing in electric railway material and accessories for tramways, are invited to send catalogues and particulars of export prices to Mr. B. Abraldes, Carral No. 9—1°, Vigo, Spain.

For Sale.—Halifax Corporation Electricity Committee has for disposal by tender one 30 ft. by 9 ft. Lancashire boiler, with sprinkler stokers and superheater. Particulars are given in our advertisement pages to-day.

LIGHTING and POWER NOTES.

Aberdeen. — RESTRICTED LIGHTING. — The Lighting Committee of the T.C. reports that owing to the curtailment of the public lighting there was a saving of £968 on the electricity account up to the end of December. The total amount saved in both electricity and gas since August last amounted to £2,000.

Barnet.-Infirmary Lighting.-The B. of G. has considered the offer of the North Metropolitan Electric Power Co. to supply energy in bulk to the new infirmary, at 1d. per unit, with an additional fixed charge of £50 per annum, the company undertaking to lay cabling in duplicate, free of cost, and has finally decided to adhere to the original intention to supply its own energy. The question of an agreement for an emergency supply of current in case of necessity was referred to a committee.

Belleek .- E.L. SCHEME .- The Fermanagh C.C. has granted permission to the Belleek R.C. to erect the necessary poles for the proposed electric lighting of the town; the power will be supplied by the Belleek Pottery.

Blackpool.—A temporary failure of the electric light on January 20th was caused by the bursting of a water main, which had the effect of flooding an electric light chamber near the central station. The motor fire engine very speedily cleared away the water.

Boston.—Prov. Order.—The R.D.C., having been asked to consent to the application of the Boston and District Electric Supply Co. for a prov. order for E.L., has decided to see what is done in the matter by the Boston Corporation.

Bury.—Overhead Mains.—Application is to be made to the B. of T. for permission to erect an overhead electrical line for the purpose of a bulk supply to Heywood.

Chapel-en-le-Frith. - Workhouse Lighting. -B. of G. has decided to obtain an estimate for an E.L., installation at the workhouse.

Chertsey.-The R.D.C. has been informed that the B. of T. intends granting an order to the Woking Electricity Supply Co. Ltd., permitting it to supply electricity in bulk to the Ascot and District Electricity Supply Co. The Council has decided to inquire from the Woking Co. what its proposed charges for current are.

Chipstead.—The Surrey County Council is advised by the Parliamentary Committee that, for its own protection, it should have Clause 14 of the Electric Lighting (Clauses) Act, 1899, inserted in the Chipetead and District E.L. Prov. Order, applied for by Mr. G. Allom.

Cleethorpes.—PROPOSED LOAN.—The D.C. has decided to apply to the Public Works Loan Commissioners for a loan for electricity purposes as follows:—Mains, £7,870; services, £965; cut-outs, £148; switchboards, &., £198; meters, £819.

Colwyn Bay.—Public Lighting.—The U.D.C. has decided to utilise high-power electric lamps instead of gas for lighting the portion of Abergele Road containing business premises, and the business part of Old Colwyn from Church Walks to the Ship Hotel.

Continental.—Spain. — A Royal Order, under date December 14th, authorises the Sociedad La Riverena, of Duero. to extend its distribution network, to include the towns of Aranza, Jumiel de Hizan, La Aguilera Vilalba, and other localities in the Spanish Province of Burgos. Similar authorisation is accorded to the Sociedad Anonima El Porvenir to the towns of Quintanilla, Sobresierra, Masa and Sedano, in the same province, through the

medium of a sub-station to be erected.

The Sociedad Anonima Union Industria is the style of a company formed at Villanueva and Geltru, Spain, for the erection

of works for the supply of gas and electricity.

A concession has been secured to supply electric light and power to the towns of Carino, Mera, San Claudio, Ortiqueira and Cedeira, in the Spanish Province of Coruna.

Crayford.—The P.C. has received amended terms for lighting by electricity from the West Kent Electric Co., which is supplying houses on the estate at Barnes Cray with current. terms have been referred to the Lighting Committee for consideration.

Coventry.—The Sub-Committee of the E.L. Committee, having inspected the dust-catching arrangement installed

mittee, having inspected the dust-catching arrangement installed in connection with the dust destructor at Poplar, recommends that a similar arrangement be installed in connection with the forthooming extensions at the electricity works.

The Electricity Committee has approved of the amended terms for the use of water from the Coventry Canal Co. for condensing purposes. The payment by the Corporation is to be £325 per annum for the present plant plus £20 per annum for each additional 3,000 kw. of plant installed. A Sub-Committee was appointed to consider as to the terms upon which electricity could be supplied to the workmen's cottages at Stoke in connection with the Leicester Street re-housing scheme. Street re-housing scheme.

Dover.—The T.C. has decided to have the drainage works lighted by electricity.

Durham.—School Lighting.—The C.C. has decided to have the E.L. installed at the County Industrial Schools.

Earlstown (Lancs.).—E.L. SCHEME.—The D.C. has appointed Mr. E. M. Lacey consulting engineer in connection with the electric lighting scheme.

Edinburgh. — HIRING CLAUSES, &c. — The T.C., by 20 votes to 13, decided to delete clauses 66 and 67 in the Corporation's prov. order, which proposed to give power to let on hire electrical appliances and to open showrooms in the city for this

Epping.—The U.D.C. has decided to oppose the London Electricity Bill.

Grimsby.—Proposed Loans.—The T.C. is recommended to apply to the L.G.B. for panction to borrow £5,000 for a new battery, £4,000 for mains, and £2,000 for services.

India.—The Ahmedabad electricity generating station is now almost completed, and it was expected to commence the supply this month.—Times of India.

Leek.—The Electricity Committee recommends, as an alternative to the existing scale, that current for power purposes, be offered at a payment of £1 17s. 6d. per quarter per Kw. of maximum demand, plus one-third of a 1d. per unit for all current used. The maximum price per unit under this scale not to exceed the price under the original scale; and that the flat rate of 2d. per unit for the scale and the scale is a scale to the heating and other domestic purposes (other than lighting) be reduced to 11d. per unit.

London.—Woolwich.—On account of restricted lighting the electricity department has allowed £180 off the Corporation's lighting account. Petitions are to be lodged against the two London Electric Supply Bills. The Finance Committee has considered a report from the borough treasurer on the question of the accelerated loan repayments in respect of the loans outstanding on plant at Plumstead electricity works, which under Sir John Snell's first report, in which he proposed the closing down of the Plumstead station, was to be replaced and become obsolete. The Plumstead station, was to be replaced and become obsolete. The borough treasurer points out that Sir John Snell in his final report advised that the Plumstead station should not now be shut down entirely, but continued in use by the destructor steam only, and to otherwise hold the plant as for reserve purposes. The Council has decided to ask the L.C.C. to accept the ordinary reyayments on the original loans in respect of the plant at Plumstead works, and to suspend the operation of the deed entered into on April 7th, 1913, for the acceleration of repayments within the next three years, having regard to the altered circumstances in connection with the Council's proposals in which the plant at Plumstead with the Council's proposals in which the plant at Plumstead works will be kept in use.

BATTERSEA.—The Electricity Committee recommends that

during the time restrictions on outside lighting are in force, a reduction of 75 per cent. be made in the contract charges in respect of hire and maintenance, & 2., of lamps installed out-ide premises, subject to the condition that the period of the agreement be extended by the period during which the restrictions are

in force.

The B.C. is recommended to present petitions against the London and District Electricity Supply Bill and the London

The L.C.C., as a result of its inquiry whether the B.C.s were in favour of the unification of electric supply in and near London and the terms on which they would be prepared to endorse the Council's scheme, finds four Councils opposed, 10 asking for post-

ponement, and that five gave indefinite replies.

SOUTHWARK.—The B.C. has been recommended in order to obtain a locus standi, to oppose the two London Electric Supply Bille.

HACKNEY.—The Finance Committee recommends the B.C. to accept the offer of the L.C.C. to advance £10,000 on account of the loan applied for in respect of expenditure on mains, and that application be made to the L C.C. for sanction in writing to the borrowing of the sum of £22,652, being the balance of the amount sanctioned.

Masham.—E.L. Scheme.—The U.D.C. has concluded an agreement with the promoters of a scheme for supplying the district with the electric light.

Nantwich. - Prov. Order. - The Crewe Corporation has asked the R.D.C. for its consent to the granting of an order by the B. of T, authori ing the Corporation to supply Wistaston Manor and other places in the township with electricity, which would also be available for street lighting.

New Zealand.—The Timaru Borough Council has been offered a supply of power from Lake Coleridge at £6 per H.P. per annum. It is not stated whether this is on the maximum installed power or on the average power used .- New Zealand Shipping and

Plymouth.—Receipts and Estimates.—The return Fry mouth.—RECEIPTS AND ESTIMATES.—The receipts for the three months ended December 31st of the Prince Rock section of the Corporation electricity undertaking shows receipts £9,298, compared with £9,518 in 1914; 888,996 units were sold as against 901,843 units in the corresponding period of last year. The Electricity Committee anticipates an expenditure in the next The Electricity Committee anticipates an expenditure in the next financial year on public lighting in the Plymouth area of £7,763, Devonport area £5,010, and Stonehouse area £965, a total of £13,738. The estimates for the electricity undertaking were for the Princes Rook section an income of £32,140, as against £32,750; and a net profit of £2 066, out of which it was proposed to spend £1,800 on meters, mains, service transformers, &c., carrying £286 to the reserve. For the Ker Street section, the estimated income was £23,164, as against £22,599, and a net balance of £1,759. On capital account on the Ker Street section it was decided to provide an expenditure of £4,500. an expenditure of £4,500.

South Africa.—The Durban Corporation has decided to appropriate a sum of £350,000 from the £960,000 loan for public works, for the extension of the water supply, electric lighting, tramways, telephone system, and other municipal enterprises — Board of Trade Journal.

Street, -E.L. SCHEME. -A limited company is to be formed at once for the purpose of carrying out the electric lighting scheme. Messrs. Christy Bros. are to take over the public lighting on an agreement for 10 years at £2 per lamp per annum.

Walthamstow. - New Turbine Plant. - The Lighting Committee has decided to enter into a contract with the Brush Co. for the supply of a 1,500-kw. Ljungstrom turbine, at £6,996, the contractors to agree to open out the turbine for inspection at the end of 12 months, it being understood that the turbine will not be taken over if the blading shows any appreciable signs of wear, the contract to further provide that the set will be replaced by a 1,500 km. disk and drum turbine in accordance with the tender for that type of plant, should the Ljungstrom set fail to comply with requirements.

West Ham.-LINKING-UP PROPOSAL. - The electrical engineer has been instructed to report on the possibility of linking-up with the Poplar electricity undertaking for mutual supply purposes

Willesden.—Owing to the shortage of carbons, the Electricity Committee proposes to convert as many as possible of the existing arc lamps to metal-filament lamps. The engineer was instructed to obtain quotations for insurance against loss by fire of apparatus which had been loaned out to consumers. The Council The Council apparatus which had been loaned out to consumers. The Council has been recommended to petition against the London Electric Supply Bills. As the Council's agreement with the North Metropolitan Electric Power Supply Co. expires on March 31st, 1918, the Electricity Committee is of opinion that the electrical engineer should be instructed to report generally upon what terms the agreement may be renewed for a further period of seven years, and also alternatively to submit preliminary plans and estimates for the erection of a new generating station, either on the site acquired by the Council for the purpose, or any other suitable site. the Council for the purpose, or any other suitable site.

Worksop. -The Traders' Association has forwarded to the U.D.C. a resolution of protest against the suggestion of the Lighting Committee to embark upon municipal trading, on the ground that it would be detrimental to the interests of the individual traders of the town. The matter has reference to the decision of the Council to support the Bill of the I.M.E.A.

Yorkshire Electric Power Bill.—The Birkenshaw Council has decided to recommend the West Riding C.C. to safe-guard the interests of the local authority by reserving to it the right at any time to supply power in the district; the Bingley Council has decided to lodge a petition against the Bill in respect of East Morton, and the Brighouse Corporation has resolved to oppose the Rill oppose the Bill.

TRAMWAY and RAILWAY NOTES.

Aberdeen.-P.A.Y.E. CARS.-Some time ago, residents a Defice II.—F.A. I.E. CARS.—Some time ago, residents in Mannofield and district petitioned the T.C. urging the discontinuance of the P.A.Y.E. cars, but the Corporation Tramways Committee recommended that as the new plan had only been in operation for a few months no action be taken. The matter is not ended, however, as the Town Council is to receive a deputation at its next meeting, and notice of motion has been given that the system be abolished on all Corporation cars.

Argentina.—The Buenos Aires City Council has conceded to the Auglo-Argentine Tramway Co. a period of one year in which to commence the work on the subterraneau line from Retiro to Constitucion; this period to commence when peace has been efficiently stimulated between the various nations. The probeen officially stipulated between the various nations. rogue is granted under the express condition that the construction of the line will terminate within a period of two years after commencement, failing which the fines provided for in the concession will be applied.—Review of River Plate.

Blackpool.—PARCELS SYSTEM. — The Corporation is introducing a tramway parcels system, to come into force on February 8th. It was hoped the system would extend to all the Fylde tramways, but as arrangements have not been made with the Fleetwood Co. the service will only apply to Blackpool Corporation and Lytham and St. Anne's tramways.

Continental. — ITALY. — By a supplementary agreement, the company which secured the concession in December, 1910, to construct the steam railway from Umbertide to Todi and Terni, has been empowered to substitute electric for steam traction. The company proposes to adopt the single-phase system at 1,000 volts and 25 periods. The estimated cost of the installation is 21,220,000 lire. The Government contributes a subsidy of 9,600

lire per km. for 50 years.

Spain.—Application has recently been made to the Spanish Government for a concession for the construction and working of an electric tramway between Madrid and the Escorial, which is

largely visited by tourists during the summer season.

Croydon.—The B.C. has sanctioned tramway improvements at an estimated cost of £2,957—a new loop each for the Addisco mbe and Norwood routes, and the provision of an auxiliary feeder for the latter.

-Tramway Extensions.→The ratepayers have approved the clauses in the Corporation's Parliamentary Bill relative to the spending of £8,190 for the purpose of proposed tramway extensions; £7,535 for the purchase of land and the pro-vision of a depô; for tramcars and omnibuses, and £200 for the electrical equipment of the tramway.

-TRAMWAY EXTENSIONS.-The U.D.C. has decided to support the Halifax Corporation's proposed Tramway Bill, so far as it relates to the extensions to Elland.

Halifax. - Proposed Tramway Extensions. statutory meeting of ratepayers held to consider the Corporation Bill sanctioned the extensions to Elland (\$22,921) and Stainland (£15.463), but rejected the proposed extensions to Ripponden (£20,293), Approval was also given to the suggestion to double the track from Stump Cross to Shelf (£10,349), which would enable through cars to be run between Halifax and Bradford.

reuddersheld. — Nine Months' Working. — The receipts of the Corporation tramways for the nine months ended December 31st last amounted to £96,654, as against £88,235 for the corresponding period of the previous year. The total working expenditure has been £52,303, compared with £48,957, and the gross surplus is £44,351, compared with £39,278. Interest on capital, redemption of debt, &c., absorb £19,378, and after provision has been made for depreciation at 3 per cent., there is a net surplus of £13,912, compared with £9,995. The reserve or renewals account stands at £20,079, compared with a balance brought forward of £30,978.

The Finance Committee is to be asked to capable the standard to cap Huddersfield. - Nine Months' Working. -

The Finance Committee is to be asked to sanction the provision of £60,000 for capital expenditure on the Elland and Marsden

tramway extensions.

London.—L.C.C.—The Highways Committee recommends the entering into an arrangement with the London Electric Supply Corporation for a further supply of power up to 3,500 kw. to the tramways, at £3 a kw. a year, plus '4d. per unit, for a period of at least six months. If after six months the power is required as stand-by, the charge will be £2 a kw. a year. The costs of cables, ducts, & D., for coupling up to the Diptford station will be some £6 850. some £6,850.

Plymouth.—Proposed Loan.—The Tramways Committee has recommended the T.C. to apply to the B. of T. for a loan of £5,000 for the provision of six additional tramway cars.

Rhondda. — TRAMWAY EXTENSION. — The estimated expenditure to be incurred by the U.D.C. in connection with the construction of new tramways and extensions, as proposed in the Council's Bill, is £25,567 and £2,400 for equipment.

-Proposed Tramway Expenditure. Rotherham.-In the proposed Parliamentary Bill provision is made for an expenditure of £9,108 for motor-omnibus services outside the borough, and £55,789 for the construction of over 5½ miles of tramways to

Southend-on-Sea.—The Corporation has deferred consideration of tenders received for the supply of three motor-'bus chassis pending the result of inquiries into the use of electrically-propelled vehicles.

-According to the Electrical World, the official statement attributes the recent fire in the tunnel of the laterborough Rapid Transit Co., New York City, on January 6th, to a short circuit on certain feeder cables in manholes on either side of the subway in Fifty-third Street. Practically all the cables were short-circuited and destroyed, creating considerable gas and smoke from the insulation; at the same time owing to the tripping of the circuit-breakers, power was out off the third rail and the trains were stopped. As our readers are aware many recold were trains were stopped. As our readers are aware, many people were held up in standing trains, several hundred being overcome by the fumes from the burning insulation and removed through manholes and gratings in the street. Moreover, 200 people were injured in the panic which occurred, one fatality being reported.

The trouble occurred at about 8 s.m., and by 4 p.m. the system was repaired sufficiently to operate local trains, and normal service

was restored early next morning.

ELECTRIC VEHICLE SAVINGS.—As the result of the experience of Mesers. Marshall Field & Co., of Chicago, with a fleet of more than 200 electric trucks and vans, Mr. Stanley Field states that with electric trucks operating at a cost of \$8 a day, the firm are able to perform delivery service which cost \$13 a day with petrol

TELEGRAPH and TELEPHONE NOTES.

Canadal—The new automatic telephone exchange at Medicine Hat (Alberta) is now in operation. The exchange equipment is designed for 2,000 subscribers, while the outside cable construction provides for 3,000. In the new building twice as many subscribers can be accommodated.

Censorship of Telegrams.—In the course of a letter from the Secretary of State, Mr. Bryan, to Mr. Stone, Chairman of the Senate Foreign Relations Committee, defending the neutrality of the United States in the European War, the Secretary states that "the reason that wireless messages and cable messages require different treatment by a neutral Government is as follows:—Communications by wireless cannot be interrupted by a belligerent. With a submarine cable it is otherwise. The possibility of cutting a cable exists, and if a belligerent possess a naval superiority a cable is cut, as was the German cable near the Azores by one of Germany's enemies, and as was the British cable near Fanning Island by a German naval force. Since a cable is subject to a hoetile attack, the responsibility falls upon a belligerent and not upon a neutral to prevent cable communication.

"A more important reason, however, at least from the point of Censorship of Telegrams.—In the course of a letter

"A more important reason, however, at least from the point of view of a neutral Government, is that messages sent out from a view of a neutral Government, is that messages sent out from a wireless station in neutral territory may be received by belligerent warships on the high seas. If these messages, whether plain or in cipher, direct movements of warships or convey to them information as to the location of an enemy's public or private vessels, the neutral territory becomes a base of naval operations, to permit which would be essentially unneutral. As a wireless message can be received by all stations and vessels within a given radius, every message in cipher whatever its intended destination, must be conper received by all stations and vessels within a given radius, every message in cipher, whatever its intended destination, must be censored. Otherwise military information may be sent to warship off the coast of a neutral country. It is manifest that a submarine cable is incapable of becoming a means of direct communication with a warship on the high seas; hence its use cannot as a rule make a neutral territory a base for the direction of naval operations,"—Times.

Norway.—The plant for the Stavanger trans-Atlantic wireless station, which had been ordered in England, was ready a long time ago at the manufacturer's works, but when the war long time ago at the manufacturers works, but when the war broke out the shipment of it was prohibited. The Norwegian Government has, however, succeeded in getting the embargo removed, and recently there arrived in Norway 142 cases of materials, including the receiving apparatus for the main station at Märland, and the bulk of the machinery for the same as well as for the sub-station. The buildings at both places are nearly completed with the machinery for the same as well as pleted, and the work of installing the machinery will be commenced at once

In the vicinity of Christiania a large wireless station is also going to be erected for the purpose of communicating with Sweden, Denmark and Russia. In the next Budget the Government will ask the Storthing for a sum of £5,555 for this station as a beginning.

Telegraphic Interruptions.—The great snowstorm of Friday last brought down telegraph and telephone wires in all directions, and caused serious interruptions throughout the Home Counties. The trunk telephone wires were particularly affected. Most of the damage was repaired during the week-end. Many overhead telephone wires were brought down in London by the damp clinging snow, and in some cases roof standards were displaced. Further damage took place on the following days, owing to falls of snow from roofs on telephone wires.

"Wireless" Wire.—It is reported that the Germans have seized £2,000 worth of copper from the Belgian Government's wireless installations in Brussels.

CONTRACTS OPEN and CLOSED.

OPEN.

Australia.—BRISBANE.—March 10th. Motor-generator, power board, &c., for Postmaster-General. See "Official Notices" January 15th.

Aylesbury.—February 6th. U.D.C. Supply of electric motors to consumers (hire-purchase agreement). See "Official Notices" January 22nd

Blackburn. — February 13th. Corporation. Twelve months' supply of stores, including a number of electrical items, for the Electricity Committee. See "Official Notices" to-day.

Bolton. — February 11th. Corporation. Low-tension sub-station switchgear, for the Electricity Department. See "Official Notices" January 8th.

Bristol.—February 11th. Twelve months' supply of carbons, joint, junction and fuse boxes, wattmeters, ambere-hour meters, boiler castings, globes, &c. See "Official Notices" to-day.

Installation, 750 points, at Cardiff.—February 22nd. New Technical Institute, Cathay's Park, for the City Council. See "Official Notices" January 22nd.

Corporation. Colchester. — February 6th. Twelve months' supply of stores, including lighting fittings, car equipment, overhead equipment, cable, &c. See "Official Notices" January 22nd.

Darlington.—February 2nd. Corporation. Alternative tenders for 2.000-kw. and 3,000 kw. turbo-alternators; separate tenders for condensing plant. See "Official Notices" January 15th.

Dover. —Tram-rails, for the T.C. Deputy Borough Surveyor.

Dundee.—February 1st. Corporation. Supply of 15-ton overhead travelling crane for Walton electric sub-station. Specification from Mr. H. Richardson, Engineer, Electricity Department.

Halifax.—February 15th. Corporation. Twelve months' supply of stores, including lighting fittings and electrical scoresories, cables, telephone wire, meters, &x. See "Official Notices" January 22nd.

Helsby.-The Parochial Committee, having heard a report on the electrification of the water and sewage stations, is obtaining tenders for the work from two local firms—the B.I. and Helsby Cables, Ltd., and the Mersey Power Co.

Hong Kong.—February 3rd. No. 5, steel structural work; No. 6, c. al-handling plant. Specifications, &c., £1 each (returnable), from Messrs. Precee, Cardew & Snell.

Leeds.—February 20th. Corporation. Twelve months' supply of stores, including cable, mains boxes and fittings, jointing and insulating material, electric lamps, fittings, &c., for Electric Lighting Department. See "Official Notices" January 22nd.

London.—Bermondsey.—February 5th. B.C. Twelve months' supply of carbons and brushes, cable and jointing material, stoneware conduits, meters, demand indicators, main fuses, oils, meter boards, street frames, covers and joint-boxes. See "Official Notices" January 22nd.

L.C.C.—February 10th. Installation (184 wiring points, 246 lighting points) at Scawfell Street Elementery School Hadron-

L.C.C.—February 10th. Installation (184 wiring points, 246 lighting points) at Scawfell Street Elementary School, Hackney. See "Official Notices" to-day.

The LC.C. is recommended to invite tenders for the supply of tramway fittings, equipment, &c., for 1915-16, and for a ventilating fan, for the Streatham sub-station.

ST. PANCRAS.—February 15th. B.C. Arc lamp carbons, for the Electricity D-partment. See "Official Notices" to-day.

ST. MARYLEBONE.—February 17th. Stores, including meterboards, casings, &c., cables, box compound and insulating materials, &c., for Electricity Department. See "Official Notices" to-day.

Manchester.—February 3rd. Education Committee. Complete electric light and bell installation at the Alice Briggs Hime, Heaton Mersey. Specification, &c., 21s. (returnable), from

nime, neaton mersey. Specification, &c., 21s. (returnable), from the Education Offices, Deansgate, Manchester.

(a) Electrically-operated elevator; (b) electrically-operated screening plant in connection with Davyhulme S wage Works extensions. Specifications (£3 3s. each) from Mr. O. J. Wilkinson, Engineer, 196, Deansgate, Manchester.

Enbergy (b) L. D. spinson of the control of

February 5th. L.P. piping and valves at Stuart Street Station.
Mr. F. E. Hughes, Secretary, Electricity Department, Town Hall.
February 16th. Corporation. 12 months, supply of stores for the Tramway Department. See "Official Notices" to day.

Newcastle-under-Lyme. - February 5th. Three-wire single, L.T. paper, lead-covered cable, armoured feeder and distributor mains, for the Electricity Department. See "Official Notices" January 22nd.

ortsmouth. — February 3rd. Corporation. Twelve months' supply of stoneware pipes, castings, street work, &c. for the Electricity Department. Forms of tender from the Electricity Station, Gan Wharf Road.

Redditch.—U.D.C. Two turbo-alternators, each 1,000 KW., with condensers, cooling tower, &c.; two synchronous motoralternators of 300 kw. and 150 kw. respectively. See Notices" January 8th.

Rochdale.—February 1st. The Electricity Committee invites tenders for sub-station buildings and sub-station switchboard at the new sub-station, Castleton, near Rochdale. Specifications, &c. (two guineas, returnable), from Mr. C. C. Aitchison, engineer and manager.

Rotherham. — February 22nd. Corporation. water-tube boilers, automatic mechanical stokers, economisers, superh-aters, foundations, steel chimneys, steam valves, steam pipes, induced-draught plants, and all auxiliaries. See "Official Notices" to-day,

Spain.-February 5th. The Spanish Post and Telegraph Authorities in Madrid are inviting tenders for the concession for the working of the telephone system in the town of Valls (Province of Tarragona) during a period of twenty years.

Woodstock.--February 4th. Generating plant, switchboard, battery, wiring, lamps and fittings (120 points), for the Union Workhouse. See "Official Notices" January 15th.

CLOSED.

Coventry.—The Corporation has placed an order with Messrs. Edward Bennis & Co., Ltd., of Little Hulton, for the following : -

Complete coal and ash handling and storage plant, consisting of wharf conveyor, cross conveyor, distributing conveyor, ash gathering conveyor, ash-discharging conveyor, and all structural supports and accessories; also the whole of the steelwork contained in the boiler house, overhead bunkers, boiler-house roof, economiser floor and boiler-house floor. The order also includes eight "Bennis" patent chain grate at kers, each 7 it, wide by 18 it. 6 in, centres, to be fitted to eight B. & W. boilers. eight B. & W. boilers.

Haslingden.—The Corporation has placed the contract for the electric light and power installation in the new Central Council Schools with Mr. A. M. Cramp, of Haslingden.

Heckmondwike.—The U.D.C. has accepted the tender of Messrs. Goodbrand & Co., at £250 (less £20 allowed for old tubes), for a new economiser at the power station.

Helsby.—The Parochial Committee has accepted the tender of the Mersey Power Co. (£36) for provision of a signal wire from the reservoir to the pumping station.

Leicester.—The T.C. has been recommended to seal a contract with Messrs. F. Webb & Son for installing electric light, fittings and bells in the new sanatorium buildings, at £433.

London. — L.C.C.—The Education Committee reports having accepted the following tenders for electric lighting :-

The Victoria School, Hammersmith, £270; Senior Street School, Paddington, £3 5; Woolmore Street School, Poplar, £210; Star Lane, Fulham, £285.—Defries & Goldman.

The Stores and Contracts Committee reports the receipt of the undermentioned tenders for the provision of an electric lift (including guides and gear) for passengers and light goods at the stores premises in Clerkenwell Close:

Titan Lift Co., Ltd				••			£450
Emith. Major & Stevens, I	id

accument a concest and con	•••	•••	•••	•••	••	•••	-

The chief engineer's estimate was £385. The lowest tender in accordance with the specification was that of the Easton Lift Co.,

The Committee reports having accepted another tender of the same firm (£415), as that tender embodies certain different arrangements which are desirable. Permission has been given to the company to sublet—(1) to the General Electric Co., Ltd., the supply of the motor, and (2) to Mesers. Latch & Batchelor the supply of the steel ropes.

The Committee has given instructions for 10,000 tons of coal to be obtained from Messrs. Wm. Cory & Sons, Ltd., as a reserve

supply for the Greenwich generating station.

The following tenders were accepted by the Stores and Contracts Committee during the three months ended December

For electric insulating material (Schedule No. 15):

L. Andrew & Co.—Items 1, 7 and 8.
British Electrical & Manufacturing Co.—Item 5.
British Westinghouse E cetric & Manufacturing Co., L'd.—Item 11.
G. Hatt risey & cons. L'd.—Item 12.
I.R., G.P. & Telegraph Works Co., Ltd.—Item 2.
G. MacLellan & Co.—Item 8.
A. Terry & Co.—Item 10.
J. Thompson.—Item 9.

Electric cables, wires and flexible cords (Schedule No. 16):

British Insulated & Helaby Cables, Ltd.—Items 1 and 5. Hooper's Telegraph & I.R. Works, Ltd.—Items 2, 3, 4, (a) and (b) 6, 7 and 8.

Electric lamp: (Schedule No. 17):
Bri ich Thomson-Houston Co., Ltd.—Items 1 to 7 (carbon-filament lamps).
Crysel-o. Ltd.—It ms 8 to 27 (metallic-filament lamps with filaments not of "drawn" wire).

The following contracts have been continued during the three months ended December 31st, from January 1st, 1915, to December 31st, 1915:—For bitumen, pitch and green oil, for the Tramways Department (Schedule No. 47):

E. Catchpole & Sons.—Item 3. Forbes, Abbott & Lenna d, Ltd.—Item 2. Grundlay & Co., Ltd.—Items 2 and 3. W. H. Keys, Ltd.—Item 1.

-The B.C. Electricity Committee recommends that BATTERSEA. the tender of the Edison & Swan U.E.L. Co., Ltd., be accepted for two additional panels to the switchboard at the electricity genera-ting station, at £151.

HACKNEY—The B.C. Electricity Committee reports that, as a

HACKNEY—The B.C. Electricity Committee reports that, as a result of an inquiry by the Borough Electrical Engineer of the various contractors in connection with mains materials, as to whether they would be prepared to renew the existing contracts for a further period of three years without an advance in price, the British Insulated & Helsby Cables, Ltd., is prepared to extend the current contract for cables and boxes for three years at the existing prices, in connection with the contract for cables; the prices are subject to a sliding scale covering market quitations in the cast of copper and lead. The Committee recommends that this offer should be accepted. In regard to the other contracts: Messrs. W. Lucy & Co., Ltd., for boxes; Leeds Fireclay Co., Ltd., for troughing; Messrs. J. Johens & Co., for blue cover tiles; these firms are not prepared to renew the contracts at current prices. The C mmittee therefore recommends that such boxes as cannot be supplied under the contract from the British Insulated & Heleby supplied under the contract from the British Insulated & Heleby Cables, Ltd., and troughing and blue cover tiles, as may be required, be bought from time to time without a special contract

SOUTHWARK—The E.L. Committee proposes to purchase two 5-H.P. motors from Mr. H. J. Hawkins at a cost of £25 each.

Reading. — The Borough Education Committee has accepted the tender of Messre. H. W. Cox & Co., of London, for an X-ray apparatus, worked from the 210-volt DC. mains, at £136.

Teddington.—The U.D.C. has accepted the tender of Messra, J. B. Marr & C. for the electric light plant at the sewage works, at £545 or £556, according to the type of oil engine selected by the Engineer.

Walthamstow.—The Lighting Committee has accepted the tender of Mesers. Hobdell, Way & Co., at £25, for repairing the boiler lagging at the electricity works.

West Ham.—The Town Council has been recommended to extend the contract with Messre. Man-field for supplies of stoneware duots required for one or two years, provided the Electrical Engineer can effect this at the same price.

-The B. of G. has accepted the tender of Messrs. E. O. Walker & Co. for electric light wiring and fittings at the new Scattered Homes for Children, at £27 15s.

-The Tramways Committee recommends accept-NOTE.—The Tramways Committee recommends acceptance of the tender of Messrs. James Russell & Co., Ltd., for the supply of poles required in connection with the overhead work for the Hull Road extension, at the sum of £538; and that of Messrs. Tramways Supplies, Ltd., for the remainder of the material required in the work, at £556. Additional cars are required for the Hull Road route, and the tramway manager has been instructed to obtain alternative tenders for the supply of six single or six double-deck cars.

FORTHCOMING EVENTS.

Junior Institution of Engineers. - Friday, January 29th. At 8 p.m. At 89. Victoria street. Debate on "London's Future Electricity Supply." opened by Mr. P. C. Battone.

(Sheffield and District Branch).—Friday, January 29:h. At 8 p.m. At Outler's Hall, Sueffield. Ordinary Meeting.
(Midland Section).—Saturday, January 30th. Social Evening.

Institution of Electrical Engineers (Birmingham Local Section).—
Friday, January 29th. At 7.82 p.m. At University, Edmund Street.
Lecture on "Kelvin's Work on Gyrostatios," by Prof. A. Gray, F.R.S.
(Students' Heeting).—Wednesday, February 3 d. At 7.80 p.m. At
Victoria Embankment, W.C. Paper on "High Explosives," by Mr. H.

North-East Coast Institution of Engineers and Shipbuilders,—Friday, Jacuary 29.h. At 7 30 pm. At Bolbec Hail, Newcastle. Ordinary Meeting.

(Graduates' Section'.—Saturday, January 30th. At 7.15 p.m. At bec Hall. Paper on "Some Notes on Ship Resistance," by Mr. A. P. Bolbec Hal Patterson.

Association of Mining Electrical Engineers (Lancashire, Cheshire and North Staffordsbire Branch).—Saturday, January 30th. At 6 39 p m. At Grosvenic Mutel Desissase, Manchester. Pesidential Address by Mr. B. Shaw, and paper on "Prevention of Electrical Accidents in Miner," by Mr. T. J. Nelson.

Royal Society of Arts.—Monday, February 1st. At 8 p.m. At J hu Street, Adelput, W.O. Cantor Lecture (III), on "Olls, their Production and Manufacture," by Dr. F. Mollwo Perkin.

Wednesday, February 3rd At 8 p m. "Imperial I dustrial Development after the War," by Mr. O. C. Beale.

Society of Engineers.—Monday. February 1st. At 7.30 n.m. At Institution of Electrical Engineers, Victoria Embaukment, W.C. Presidential Address by Mr. Norman Scorgie.

Institute of Marine Engineers.—Tuesday, February 2nd. At 8 p.m. At Tow r Hill, Minories, E.C. Paper on "Small Screw Propellers," by Mr. D. H. Jackson.

Ronigen Society.—Tuesday, February 2nd. At 8.15 p.m. At Middles Hospital, W. Paper on "Measurement of the Radiation from t Coolinge and other X-Ray Tubes in Clinical Use," by Dr. S. Russ.

Greenock Electrical Society.—Thursday, February 4th. At 745 pm. At 24, West Sewart Street. Paper on "Humination," by Mr. F. B. il, Wess -Humphriss.

Royal Institution of Great Britain.—F. iday, February 5th. At 9 pm. At Albemarle Street, W. Paper on "Science and Industrial Problems," by Prof. A. W. Crossley, F.R.S.
Monday, February 1st. At 5 p.m. General meeting.

NOTES.

Cable Manufacturing at Perivale: Correction.—
In one of our "War Items" of January 15.h we gave a summary of some remarks made by the Surveyor to the Greenford District Council, respecting the firm of Geipel & Ch., who are constructing cable manufacturing works at Perivale. We reported him as saying that "the head of the original firm was naturalised in 1848," but we are informed that what he actually did state was "that Mr. Geipel had been naturalised in 1848, but that he did not know if he was the father of the senior member of the firm." adding that if he was the father of the senior member of the firm," adding that "all the members of the firm were British born, and that there was not any German capital in it." In case the report should have misled any of our readers we wish to remind them of the letter issued by the firm in September last, when so many houses were clearing away misunderstandings as to their constitution, in which it was pointed out that the principal of the firm was British born and bred, and that its capital and employés were entirely British also. Those who know Mr. W. Geipel, as we have done, personally for the past 20 years, will recognise that the 1848 naturalisation reference could not relate to him seeing that he is well on the right side of the age that such a date wind give well on the right side of the age that such a date would give

Institution and Lecture Notes. - Institution Electrical Engineers.—On December 16th, the mangural meeting of the Hone-Kong Local Section was held in the RA. Theatre, Victoria Barracks, Hong-Kong. The meeting was of a semi-public character, and engineers from the various works and companies in the vicinity were invited, in addition to members of the Institution. Members also had the privilege of bringing their lady funds. His Excellence the Covernor and Lady May and the Institution. Member also had the privilege of bringing their lady friends. His Excellency the Governor and Lady May and a party of friends attended, accompanied by the General Officer Com-

party of friends attended, accompanied by the General Officer Commanding the Forces, and also the Commander of the Feet.

Col. Baker Brown, M. I.E.E., offier in command of the Royal Engineers, read an interesting paper entitled, "Some Mulitary Uses of Electricity." Owing to the mixed assembly, the author did not treat the subject so much as a technical matter, but more in a descriptive manner maintaining the interest of the non-technical with amusing references to the various difficulties encountered in the field, camp and barracks. It was of great interest to the technical people present to hear that the army can lay some 2½ miles of telephone line on light poles within an hour, also that the wire usually consists of strands of steel as well as copper, to enable it to withstand the rough handling during field operations. The beautifully "flat" load curve and consequently high load factor of the military generating stations was the subject of envious of the military generating stations was the subject of envious comment by the central station engineers present.

At the conclusion of the paper, Mr. W. L. Carter, M.I.E.E., chairman of the Local Section, proposed a vote of thanks to the author, to which Col. Baker-Brown suitably responded.

The following members of the I.E E. were present:—
Mr. W. L. Carter (chairman), chief engineer, Telephone Co,

Hong-Kong.
Col. Baker-Brown (vice-chairman) Officer Commanding R.E.
Professors A. Warren (hon. sec.) and C. A. M. Smith, Hong-Kong
University. Mesars. E. T. Williams, chief engineer, Naval Yard,
Hong-Kong; R. F. Long, G. R. Archdeacon and C. H. N. M.
Hamilton. China Light and Power Co., Kowloon; and F. J.
Geltion, W. C. Jack & Co., Ltd., Hong-Kong.
The chairman was to give his address during the course of this
month; Prof. C. A. M. Smith is also to give a paper, and the session
will be concluded with a paper by Mr. C. H. N. M. Hamilton on
"Methods of Harmonic Analysis."
At the meeting of the MANCHESTER LOCAL SECTION on Tuesday

At the meeting of the MANCHESTER LOCAL SECTION on Tuesday last a paper was read by Mr. T. D. Robertson on "Electric Steel-making Furnaces," and was followed by a discussion.

Salford Technical and Engineering Association.-The Syllabus for 1915 of this Association includes the following items :-

February 13th.—"How Plants Protect Themselves," by Mr. J. E. McDonald.
March 6th.—"The Strength of Iron Castings," by Mr. E. L. Rhead.
April 3rd.—"Lifting Machines," by Mr. D. Hiley.
May 5th.—Visit Gresley Iron Works.
June 12th.—Visit Steat Herest Power Station, Manchester.
July 10th.—Visit Steat Herest Power Station, Manchester.
July 10th.—Visit Barton Hall Entine Works, Patricroft.
August 2tst.—Visit Messrs. Pilkington, Tile and Pottery Co., Clifton Junction.
September 4th.—"Ball and Roller Sovines," by Mr. A. H. Hindle.
October 2nd.—"The Wonders of C. at," by Mr. G. R. Kew.
November 6th.—Members' Short Papers.
December 4th.—Visit Salford Corporation Cleansing and Flagmaking
Department.
December 3th.—Annual Social.
Wireless Society of London.—Mr. A. Campbell Swinton

Wireless Society of London. - Mr. A. A. Campbell Swinton, who delivered his presidential address on Tuesday, gave an interesting series of experiments illustrating how the discovery of "wireless" was led up to.

Electric Lamps in Mines. - The value of the miner's electric lamp was exemplified in an explosion at the Minnie Pit, Halmerend, Stafferdshire, recently, which resulted in the death of nine men and injury to 18 others. The survivors were in total darkness, in a foul atmosphere, until an electric lamp was found which enabled them to reach a place of safety.

A dispute has arisen in the South Wales coalfield, one of the points at issue being the introduction of safety lamps into note.

points at issue being the introduction of safety lamps into naked light collieries without the customary extra payment; the owners contend that the improvement in oil and electric safety lamps has removed the disadvantage of illuminating power, upon which increased payment was based.

Appointments Vacant.—Shift engineer for A.C. work (30s.), for Neath U.D.C.; overhead lineman (35s.), for Kirkcaldy tramways department; temporary clerk (30s.), for Swindon electricity and tramways department; shift engineer (26s.), for Heywood Corp ration electricity works; charge engineer, during the war (37a.), and switchboard attendant, permanent (27s.), for Wakefield electricity department; junior assistant electrical engineers (15s.), for Newcastle-upon-Tyne Electric Supply Co. Particulars are given in our advertisement pages.

The Electric Vehicle Committee. - A meeting was held on January 8th, when the secretary submitted a report as to the issue of the first number of The Electric Vehicle, which was considered satisfactory. He also submitted a return as to the sales of the Publicity Mail Cards, which showed that only a comparatively small quantity of these had been ordered so far.

The Committee decided to circularise the various undertakings to find out how many standard charging signs would be required, so that it might make arrangements for their production by one

manufacturer.
An intimation was received from the Tungsten Lamp Associa-An intimation was received from the langues Lamp Association stating that they had appointed a Sub-Committee to go into the proposed standardisation of glow lamps with the Electric Vehicle Committee, and it was decided to invite this Sub-Committee to meet the Technical Sub-Committee of the E.V.C. at its

next meeting.

The Committee had before it the size of wheel rims for solid tres standardised by the Engineering Standards Committee at the instance of the Society of Motor Manufacturers and Traders, and decided to recommend purchasers of electric vehicles to insist upon having these standard rims fitted. The question of charging

equipments is being further gone into.

The next meeting is fixed for the 5th proximo.

Fatalities.—At Lye, on January 20th, an inquest was ratalities.—At Lye, on January 20th, an inquest was held on the body of Ernest A. Bristow, 15, of Pedmore Road, Lye, who was killed on the 16th inst. The lad was employed in the enamelling department of Mesers. Weson Bros., Ltd. Arnold Baker, ironplate worker, said the boy was helping him to put a new piece of piping on a stove which warmed one of the rooms. The pipe was supported by a piece of wire from a beam along which ran an electric cable, and was also attached to come pieces of sheet ivon which had been fastered up and which were found to which ran an electric capie, and was also attached to some pieces of sheet-iron which had been fastened up, and which were found to be alive with electricity. They had put the pipe where they wanted it, and just as they were going to loose it there was a flash and a shock, witness going one way and Bristow the other. Bristow cried "Oh!" several times, and groaned. Artificial respiration was tried without success.

Terah Shearer, foreman of the enamelling department, said that a 200-volt current was passing through the electric wire. They had had the cables tested, but could not yet find any leakage. Dr. Hardwick said there was no doubt the electric shock was the cause of death. The jury returned a verdict of "Accidental cause of death.
Death."

Death."

An inquest was held at Hednesford on January 21st into the death of Joshus Thomas, 55, who had been employed by the West Cannock Colliery Co., at Hednesford. On January 19th, a 6-in. nail was found driven into an electric cable on the main engine road of the pit, near where his body was found. Dr. A. Gardner said that when he was called to the colliery Thomas was dead. There were burns on his right hand and forearm, and an abrasion on the right side of his face, probably caused by falling. Witness attributed death to cardiac failure, due to electric shock. Percy Hooper, a nipper, said he saw Thomas go to the cable, but did not notice him do anything, as he had his back towards him. A moment later Thomas fell grosning. Witness then noticed a long wire later Thomas fell groaning. Witness then noticed a long wire nail sticking in the cable. It was driven in about ½ in. Other evidence showed that the nail had not been seen in the cable previously. It was examined on the morning of the accident because a complaint had been made of a shortage of current. Henry Holcroft, chief electrician at the colliery, said the cable was alive Holcroft, chief electrician at the colliery, said the cable was alive all day and all night. Thomas would receive a 330-volt shock. The normal full voltage of the cable was 650 volts. Witness fetched the nail out of the cable. The shape of the hole in the cable indicated that the nail had not been driven in, but worked up and down by hand and forced in. The Coroner remarked that the deeper they went into the matter the more it appeared that Thomas must have put the nail in the cable himself. Nobody but an ignoramus, or a lunatic, would have done such a thing. The verdict of the jury was that "Death was due to misadventure through coming into contact with the nail in the cable, but that there was not sufficient evidence to show how it came to be there,"

Mr. J. T. Arthurs, electrician at Messrs. Starkey, Knight and Ford's Brewery, at Tiverton, was killed on Tuesday last week. Hos coat was caught by a revolving shaft while he was oiling it, and he was drawn up between the girders, with the result that his arms were pulled from the shoulders.

were pulled from the shoulders.

Metropolitan Association of Electric Tramway Metropolitan Association of Electric Tramway Managers.—A meeting of this Association was held on Friday, 15th mat, at the Municipal and County Club, Whitehall, S.W., when the following were present:—Messrs. Ullmann (East Ham), chairman; Schofield (Leyton), vice-chairman; Coveney (Erith), Harvey (Ilford), Moff-t (West Ham), Goodyer (Croydon), hon. secretary; Mason (South Metropolitan), Mackinnon (London United), Hammond (Metropolitan Electric), and C. Mittelhausen. Messrs. Murray (Walthamstow) and Stokes (Bexley Heath) were unable to attend. Mr. A. Coveney, formerly engineer and tramway manager at Erith, was entertained to dinner, on his resignation as a member of the Association.

Electricity Committees and Coal Supplies.—A trade correspondent says large consumers of coal and particularly trade correspondent says large consumers of coal and particularly those in control of electricity and gasmaking plant are becoming alarmed by the shortage in the supply of coal. With a view to securing relief in this direction the Manchester and Salford Corporations are convening a conference of various municipal authorities, to pass a resolution requesting the Government to suspend the operation of the Coalmines Regulation Act, 1908, and thus enable colliers to work more than eight hours a day. The conference will be held in Manchester. Similar resolutions have been adopted in Classow. Glasgow.

Freemasonry.—The second regular meeting of the Kreemasonry.—The second regular meeting of the Kelvin Lodge, No. 3,736, was held on Friday, January 22nd, at Mark Mason's Hall, where, in spite of the inclement weather, a goodly number of brethren supported the Worshipful Master W. Bro. Delebecque, both in the lodge and at the feative board. The next regular meeting will be held on Friday, March 26th, at 5 p.m., at Mark Mason's Hall.

Educational Note. - North-East Coast Institu-TION OF ENGINEERS AND SHIPBUILDERS.—A Scholarship will be offered for competition among Graduates of the Institution in September next, tenable for two years, and of the annual value of £50. Particulars may be had from the Secretary.

Radium.—The director of the United States Bureau of Mines announces in his annual report that the technical experts of the Bareau have devised a process for the extraction of radium from ores which can be used on a large scale, and which is more efficient than that used by the largest foreign producers of radium. It is believed that the cost of radium to the consumer will be reduced to one-third of the present price.—Chemical Journal.

An American Proposal to Australia.—A proposition has been put before the Australian Premier for the establishtion has been put before the Australian Premier for the establishment of a co-operative colony of American citizens in New South Wales. A society with 1,000 bondholders, with £100 as the membership fee, would take to its adopted country £100,000. As to 40 per cent. the settlement would consist of mechanics, and both primary and manufacturing industries would be engaged in. The manufacture of paper, electrical enterprises and the manufacture of machinery are mentioned.

Concert.—Messrs. Babcock & Wilcox's annual concert, which will be held at King's Hall, Holborn Restaurant, on February 12th, commencing at 7.30 p.m., will be devoted this year to the purposes of the Red Cross Society, and tickets will be on sale. The company hope that friends who have assembled in the past will strongly support the concert this year.

New Swedish Turbine.-From Gothenburg it is reported that trials have lately been carried out with a new type of steam turbine, which, it is hoped, will effect a saving of something like 30 per cent. in steam consumption, while the space occupied is considerably smaller than in the case of existing types.

Electricity from Saw - Dust .- An electrical power station is about to be erected at Guane, in Sweden, at which saw-dust from a saw-mill in the neighbourhood will be used as fuel. The saw-dust is directly conveyed from the saw-mill to gas pro-ducers specially constructed for this kind of fuel, and transformed into electrical energy in the usual way. It is estimated that the saw-dust available is sufficient to produce 2,200 electrical H.P., though the station to be built in the first instance is only designed for 1,100 H.P. The cost of fuel will scarcely amount to more than 50 per cent. of the cost of production of electrical energy from water-power in Sweden.

An Interesting Table.—In view of recent expressions All Interesting Table.—In view of recent expressions of opinion on the ethics of advertisement, we may allow ourselves to comment on a novel table which appears in our advertisement pages to-day. The views which it represents may or may not meet with general approval; but that it attracts and holds the attention of the reader, we think, will not be denied. As a basis for discussion at a meeting of practical men it would probably lead to a most interesting debate, if not to blows, and if the Society of Supervising Electricians, for instance, were to adopt it for this purpose we should look forward to the meeting with keen anticipation. anticipation.

OUR PERSONAL COLUMN.

The Editors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL REVIEW posted as to their movements.

Central Station Officials.—The Coventry Electricity Committee has decided to grant the following increases of salary in the electricity department:—Mr. E. V. Newbould, chief clerk, from £1 to £4 104, per week: Mr. A. A. Harris, second clerk, from £2 10s. to £2 15s.; Mr. A. V. Leeson, collector, from £2 10s. to £2 15s.; Mr. P. SNAPE, assistant mains engineer, from £2 15s. & £2 5s. Mr. Department of the content of the c from £2 15s. to £3 5s.; Mr. Pettipher, engine-room foreman,

from £2 to £2 5s.

MR. J. W. BURR, late of Croydon, the new borough electrical engineer of Swansea, was welcomed to his new sphere of labour at a staff dinner held at the Royal Hotel, Swansea, on Thursday

evening last week. Col. Alex. Sinclair (chairman of the Electric Lighting and Tramways Committee) presided, and was supported by Ald. Geo. Colwill (vice-chairman), Ald. David Davies, Messrs. David James (Tramways Co.), A. L. Furneaux (electrician) and others. The guests and staff numbered nearly 70. The Chairman, and the color of the color o others. The guests and staff numbered nearly 70. The Chairman, in introducing Mr. Burr, said he thought they should follow the patriotic motto, "Business as usual." Mr. Burr had come to Swanses with the full intention of "booming the show." Mr. Burr met. with a most cordial reception. He appealed to the staff not to be "clock-watchers," but to put their whole energies into their work. He accepted the chairman's challenge, which in effect was to get on or get out. Referring to the discussion at the recent Council meeting, he said that, as a mechanical engineer, he professed to know something about suction gas, but now after hearing that £4 per week could be saved by using it instead of electricity, he came to the conclusion that he knew nothing about it.

MR. HAROLD GRAY, electrical engineer, applied to the Accringms. HAROLD GRAY, electrical engineer, applied to the Accrington Electricity Committee, on January 21st, for permission to take a commission in the new Artillery Brigade. The requisite permission was given. Mr. Gray was senior lieutenant in the Territorial Artillery. It was understood arrangements would be made for carrying on the work at the electricity station under Mr. Gray's assistant, the Corporation to have the benefit of Mr. Gray's avertical description of the corporation of th

services in a consultative capacity during the time the proposed Artillery Brigade is in Accrington.

Owing to the state of his health, Mr. C. Atchison, borough electrical engineer of Rochdale, has received permission of the Electricity Committee to be away from duty for some weeks from

the beginning of February.

The Aldershot U.D.C. has increased the salary of Mr. Ebert, first assistant at the electricity works to £143 per annum, rising by £6 10s. a year to a maximum of £156.

General.—The undernoted changes have taken place District Railway Co., London Electric Railway Co., City and South London Railway Co., Central London Railway Co. :—MR W. E. MANDELICK, in addition to his office as secretary to the above companies, is appointed business manager. MR. Z. E. KNAPP is appointed manager for maintenance and construction to the above appointed manager for maintenance and construction to the acover companies. Mr. H. E. Blain is appointed operating manager to the above companies. Mr. W. E. Blake, in addition to his position as superintendent of the line to the District Railway, is appointed superintendent of the line to the London Electric, City and South London, and Central London Railways, in place of Mr. J. P. Thomas, who has resigned his position with these companies. J. P. Thomas, who has resigned his position with these com-panies, to become general superintendent of the London General Omnibus Co., Ltd. In this capacity MB. THOMAS will have charge

of all the work of operation, under the general control of the operating manager, Mr. Blain.

At St. Ann's Church, Stauley, on January 21st, the marriage took place of ME. HARRY COOPER, A.I.E.E., of Stoneycroft, and At St. Ann's Church, Stauley, on January 21st, the marriage took place of Mr. Harry Cooper, A.I.E.E., of Stoneycroft, and Miss Aunie Rose Walkins, youngest daughter of the late Mr. Richard Watkins, Liverpool and St. Helens.

Mr. JOHN GILBERT, of Farcet, Peterborough, has secured an appointment as electrical engineer to the Co operative Goldfields, Ltd., West Africa, and sails at the end of this month.

Mr. Arthur J. Foord has been appointed first assistant electrical engineer-in-charge at the new Naval Dockyard at Rosyth. He has for 26 years been in the electrical engineers' department.

He has, for 26 years, been in the electrical engineers' department at Chatham Dockvard.

MB. C. F. D. SUGGATE, A.M.I.E.E., A.M.I.Mecb.E. who for the past four years has been engaged as an assistant engineer in the electrical engineer's department of the Great Eastern Railway, has resigned his appointment in order to take up a commission in His Msjesty's Army as a temporary lieutenant (Inspector of Ordnance Machinery) in the Army Ordnance Department. His address is now () Ordnance College, Red Barracks. Woolwich.

The marriage has taken place at Holy Trinity Church, Weymouth, of ME CHRISTOPHER HODGSON, chief electrician of H.M.S. Commonwealth, and Miss Ethelind Burt, only daughter of the late Mr. James Burt.

Mr. James Burt.

Mr. Walter Birchall, transformer expert in the service of the Riegos y Faerza del Ebro Co., Barcelona, was married a few days ago a* the British Consulate, Barcelona, to Miss A. A. Winstanley, of Leigh.

Obituary. - Mr. W. Morton, formerly Superintendent Post Office Telegraphs at Southport, died at Southport last Friday, at the age of 76 years. He retired from the telegraph service about 18 years ago.

NEW COMPANIES REGISTERED.

Caerphilly Electric Supply Co., Ltd. (139.086).—This company was registered on January 22nd wish a capital of £6,000 in 400 cumulative preference shares of £5 each, 1,500 preferred ordinary shares of £1 each and 2,500 ordinary shares of £1 each, to carry on the business indicased by the sittle. The subscribers (with 50 hares each) are:—J. H. Edwards, Haresfield, Stonehouse, Gloucester, engineer: A. A. Douglas, Brendou, Colwyn Bay, manufacturer. Private companies. The number of directors is not to be more than six: J. Heibert Edwards is first managing director; qualification, 50 shares. Solicitors: Seymour Williams & Co., 28, Parliament Street, S.W.

Cinema Supplies, Ltd. (9,306) — This company was registered in Edinburgh on January 20th, with a capital of £1,000 in £1 shares, to manufacture and to do in commant graph films, carbons, electrical plant, do. The subscribers (with one share each are:—R. Ralston, 118, ct. Vincent Street, clasgow, tawher: N. A. Henderson, 118, St. Vincent Street, Glasgow, law clerk. Private company. The first directors are not named; remuneration, £50 each per annum (chairman, £75).

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Telephone Company of Egypt, Ltd.—A memorandum of satisfaction to the extent of £1,200 bn December 8th, 1914, of debenture stock covered by stust oeed and deeds of acknowledgment, dated from July 27th, 1904, to October 27th, 1909, securing £200,000, has been filed.

Coatbridge and Airdrie Electric Supply Co., Ltd.—Further charge on the company's undertaking and property, present and future, including uncalled capital and Coatbridge and Airdrie undertakings, dated December Sist, 1914 (supplemental to charge dated October 17th, 1906), to secure £4,500. H. idera: County of London Electric Supply Co., Ltd., Moorgate Courts, Moorgate Place, E.C.

Spensers, Ltd.—Debenture dated January 5th, 1915, to secure 2780 (ranking part passu with £7,000 lst mortgage debentures) charged on the company's undertaking and property, present and future, including uncelled capital. Holders: S. F. Ellis, Unwia Street, Stratford on Avon, and S. Titterton, 73, Edmund Street, Birmingham.

Amazon Telegraph Co., Ltd.—Capital, £250,000 in £10 shares. Beturn dated December 1st, 1914; all shares taken up; £230,000 paid. Mortgages and charges: £277,800.

Spagnoletti, Ltd.—A memorandum of satisfaction in full on December 81st, 1914 (a) of trust deed dated October 22od, 1907, securing £12,500; and (b) of second debenture dated April 29th, 1912, securing £3,000, has been filed.

Wadebridge and District Electric Supply Co., Ltd.— Debenture dated January 18th, 1915, to secure £850, charged on company's undertaking and property, presents and future. Ho:der: U. E. Hannaford, York House, Perham toad, West Kenaington.

Oriental Telephone and Electric Co., Ltd.—A memorandum of satisfaction to the extent of £300, on December 17th, 1914, of debenture stock, covered by trust deed dated June 28th, 1905, and deed of acknowledgment dated June 12th, 1907, securing £200,000, has been filed.

CITY NOTES.

Company Registrations in 1914.—In an article on this subject appearing in the *Investors' Guardian*, of January 23rd, the writer says:—'The motor and engineering groups shows large decreases, although the war has caused very great activity in certain departments of these trades. The textile group also returns a much smaller capital. The figures for the year show a heavy decline in land and development concerns, which may be traced directly to the slump in Canadian and American development enterprises. Electric companies have mustered only £1,100,000 of capital in the whole year; a remarkably small amount even for an industry which has long been in a depressed condition.

English Registrations.	1912.	1913.	1914.
No. of companies	6,796	6,871	5,701
Coal and fuel	£4.973,845	£6,644,383	£3,482,550
Electric	7,579,780	6,102,389	1,130,350
Engineering and hardware	8,885,757	10,774,891	6,792,017
Gas	407.900	281,750	193,275
Motor, cycle and carriage	7,253,879	8,934,265	4,453,361
Oil	23,533,182	12,978,939	17,641,090
Plantation and rubber	3,209,965	4,338,500	3,004,427
Railways and tramways	3,164,200	2,754,007	1,761,000

Norway.—Calcium Carbide Manufactories at Odda. According to the annual report of the Alby United Carbide Factories, Ltd., the results from last y-ar's working were not quite so satisfactory as those for the preceding year. This was partly due to the great strike that took place, owing to which the production was reduced by 4,500 tons. During this strike period the company was obliged to pay for the electrical energy not employed, which, of course, involved a great expense.

The North Western Cranamide Co. of which the Alby Co. holds

course, involved a great expense.

The North-Western Cyanamide Co., of which the Alby Co. holds half the shares, has now for the first time paid a dividend, which was fixed at 15 per cent. The manufacturies of this company are also situated at Odds, and are getting their energy from the Tyssefaldene. As regards the prospects for the year ending on June 30th, 1915, it was stated in the report that the work was shut down altogether when the war broke out, but taken up again soon afterwards to such an extent that about 40 per cent, of the energy at disposal was employed. The output has gradually been extended, and the works will shortly be fully occupied. During the last four months there has been shipped nearly twice as much carbide as in the corresponding period in 1913.

The assets of the Alby Co. amount to about £864,800, of which

about £331,700 are represented by shares in the Nitrogen Products and Carbide Co.; the latter concern is financing the large Aura Co., whose plants are now under construction.

East London Railway Co.—The report for the year ended December 31st, 1914, gives the number of passengers carried as follows:—1914, 6,172,121; 1913, 5,149,064. The net income amounted to £35,667, plus £9,711 brought forward.

Stock Exchange Notice. - The Committee has ap-

pointe 1 a special settling day as under:—
Thurday, February 11th.—Brisbane Electric Tramways Investment Co.,
Ltd.—Further issue of \$3,000 ordinary shares of £5 each, fully paid, Nos. 90,001 to 120,000.

and has ordered the securities to be officially quoted.

Blackpool and Fleetwood Tramroad Co.dividend of 4½ per cent., making 6½ per cent. for the year, is announced.

Held Over.—Pressure upon our space compels us to hold over several City reports until next week.

Traction and Power Securities Co., Ltd.—The directors recommend a dividend of 4s. 6d. per share, free of incometax, for the year 1914.

St. James's and Pall Mall Electric Light Co., Ltd.-The directors announce a dividend for the half-year ended December, 1914. of 5s. per share on the ordinary shares, making, with the interim dividend, 10 per cent. for the year. The rate for 1913 was 12 cent., and for 1912—10 per cent.

Liverpool Overhead Railway Co.-The directors recommend a final dividend (for the half-year ended December 31st last) at the rate of 5 per cent. per annum (less income-tax) on the preference shares, and 3½ per cent. per annum (less income-tax) on the ordinary shares, making, for the year, 5 per cent. on the preference and 3 per cent. on the ordinary shares.

Westminster Electric Supply Corporation, Ltd.-For the last half of 1914 a dividend at the rate of 8 per cent, per annum is announced, making 9 per cent, for the year. For 1913 and 1912 the dividend was 10 per cent.

STOCKS AND SHARES.

Tuesday Evening.

THE naval victory of last Sunday had a cheering effect upon Stock Exchange markets. Prices did not advance to any appreciable extent, but some of the softening which had previously appeared

extent, but some of the softening which had previously appeared in certain sections turged into strength, and business on the whole was certainly quickened by the very satisfactory news.

Bit by bit the Treasury restrictions are being relaxed, and brokers find it easier to deal with perfectly hone-fide investment broders, to the execution of which no barrier should be placed. The Treasury policy is to prevent money from leaving the country, and, to this end, no modification has yet been granted in the direction of allowing the Stock Exchange to sell securities for anybody—ally, neutral or enemy—outside the confines of the United Kingdom.

The individual cases of hardship which this inflicts upon many The individual cases of hardship which this inflicts upon many French, Belgian and Dutch holders of securities, who have no possible connection with Germany, may well be imagined; and some people object to the Treasury acting not only in an arbitrary manner—this, of course, being reasonable enough in war time—but in a way which may possibly defeat its own ends, while imposing real suffering upon staunch friends. The Belgian refugee with £500 worth of securities which he has managed to take with him in his flight to Holland or to England, may well feel that he is being treated with undue severity in not being allowed by the Treasury to realize money by the sale of his stock allowed by the Treasury to realise money by the sale of his stock

in open market.

The broadening of business is noticeable chiefly in the purely investment securities, while in the more speculative issues trade is still largely to seek. It is surprising that there should be so little is still largely to seek. It is surprising that there should be so little going on in electric lighting shares, where movements on the week are mostly downwards. This is due more to sentimental reasons than to actual pressure to sell, as we have pointed out here on many occasions. The prices which have suffered this week are County of London Ordinary and Preference, City Ordinary and Preference, St. James's and Westminsters. Moreover, the market for the Debenture rtocks is not so firm as it was. The principal reaction is in St. James's 3½ per cent. Debenture, the price of which reverted to 80. Metropolitan 3½ per cent. Debenture also came in, and was lowered to the same level as St. James's. The yield at this price is £4.7s. 6d. per cent. on the money.

Subjuined are our usual tables of Stocks and Shares:—

TELEGRAPHS AND TRUEPHONES.

The Home Railway market is passive, awaiting dividend announcements. The first of these come this week, and the market anticipation seems to be that distributions will be at levels a shade anticipation seems to be that distributions will be at levels a shade lower than those of a year ago. There is, however, such wide scope for surprise that no one feels anxious to speculate on dividend chances, so the attitude adopted is a waiting one. In years gone by there used to be lively speculation in dividends; and to such an extent did the gambling run that the Committee of the Stock Exchange passed a rule, which still holds, forbidding transactions in dividends. Prices of the Underground group are a little easier on the week, with the exception of the Underground Electric Railways issues, which are rather firmer. issues, which are rather firmer.

Of Foreign issues, Brazilian Tractions have recovered, in conse Of Foreign issues, Brazilian Tractions have recovered, in consequence of the declaration of the usual quarterly dividends on the common stock, noted here last week. The Rio exchange moves erratically, and, swinging with it, the prices of all Brazilian securities rise and fall. The Mexican group is very weak. Mexican Tramway bonds have fallen heavily. It looked a few days ago as though the United States were about to intervene, and put a stop to the intolerable state of affairs prevailing in Mexico; but this has not fructified, and affairs in the Southern Republic are as chaptic as ever chaotic as ever.

Auglo-Argentine Trams have gone back, in sympathy with most of the other securities connected with the country, which has suffered so severely from floods that every industry—especially that of the railways—must be affected. The embargo laid by our own Treasury upon fresh issues of capital is another factor which may operate to the detriment of such a company as the Anglo-Argentine Tramways, the very hugeness of which implies the necessity for

Tramways, the very hugeness of which implies the necessity for periodical capital outlayr.

In the Manufacturing group, interest centres mostly upon Armament shares. Vickers, Armstrongs, B.S.A., and Projectiles make a quartet in the shares of which great activity prevails in the Stock Exchanges of London and the Northern provinces. The prudent holder, noting the sharp advances of the past fortnight, and realising that no small amount of the huge profits being earned by the companies must be applied to erection of new plant and machinery before anything sensitional can be expected in the way. machinery before anything sensational can be expected in the way of dividends, will probably recognise the wisdom of selling part of his shares now, especially if he can take a reasonably good profit. The companies dealing with chemicals, too, are prospering greatly. Castner-Killners have risen to 31

Castner-K-liners have risen to 3k.

The Electrical Manufacturing shares have gone back here and there, though the declines are small: Electric Constructions furnish an exception, with a sixpenny rise to their credit. The Rubber share market is firm, and the strength of the raw material affords justification for the investment purchases that are going on in the Throgmorton Street and Mincing Lane exchanges. The provinces, too, are taking something of a hand in this market; and any sales which might otherwise emparts from Relgium and and any sales which might otherwise emanate from Belgium, and so check improving prices, are avoided by the Treasury restrictions, to which reference has been already made.

EXPORTS AND IMPORTS OF ELECTRICAL GOODS DURING DECEMBER, 1914.

WITH the present return, we bring to a close our monthly record of electrical exports and imports for 1914.

Following the prevailing tendency to which we refer elsewhere, the value of the electrical exports shows a further falling-off as compared with the previous month, the total being for December £290,069, as against £349,254 for November. This drop in value occurred in all the principal lines, such as machinery, cables, telegraphic and telephonic material, lamps, &c.; but the returns show an increase under the miscellaneous headings of goods fittings, &c., and for battery exports as compared with the previous month.

month.

The imports of electrical goods, on the other hand, have shown a rapid recovery to normal values, reaching a total of £261,303, as compared with £201,569 in November, and monthly averages in 1914 of £230,600, and in 1913 of £245,500.

The increased imports are fairly well distributed, but particularly marked in the machinery, cable, telegraphic and telephonic sections. As regards the latter, it may be noted that Canada appears as an importer of some £19,000 worth of telegraphic and telephonic apparatus.

The re-exports, at £25,510, compared with £29,447 in November. Our most prominent customer during the month was Argentina, with whom electrical trade has apparently not suffered to the same extent as in other markets. Turning to the importers into this country, the U.S.A. has increased its last month's big total of s, reaching in December a value within a few thousands of the highest ever reached by Germany; I'aly also expanded her usual trade value in December, while Dutch lamp imports have

more than trebled her usual business during the past few months.

On the following pages we reproduce a series of curves for the whole year, based on these monthly statistics.

ELECTRICAL EXPORTS AND IMPORTS DURING 1914 AND PREVIOUS YEARS.

THE year 1914 will be indelibly impressed on the memories of most of us because of its unfortunate association with the present European war, which great as it is in extent, in the numbers engaged and interests involved, shows an unmistakable tendency to spread still further. The withdrawal of the wealthiest industrial nations of Europe from their normal cccupations, and the interference with, and diversion of, the business of so many adjoining, though neutral countries, has naturally played havoc with the European electrical industry as a whole, though we are glad to think that the British share in particular has not suffered so severely as might have been

respected.

It is necessary to emphasise the fact that this is an "engineering" war, and the demands on us for engineering material for the allied armies on a war footing are such that the manufacture of war material has replaced

break of war, and was followed by a partial recovery in busi-

No large telegraphic export occurred during the year, but the general export business (dot and dash curve) remained fairly steady at a reduced level during the first six months of the year. In contrast to this the imports remained steadily at a higher level than they have ever previously reached during the first half of 1914, which reference to our last set of curves, fig. 7, will show to be due to the combined efforts of American and German importers, but more especially the latter.

The re-exports, comparatively small in amount, have returned to something like pre-war level.

The gross values of our electrical exports and of the tele-

The gross values of our electrical exports and of the tele-graphic material included therein, for the five years included in the curves, were as follows:

1910	Gross	£5,700,000	 Telegraphic	£2,267,500
1911	,,	£4,600,000	 ,,	£560,000
1912	. ,,	£6,300,000	 ,,	£1,500,000
1913	,,	£7,568,000	 ,,	£2,388,000
1914	,,	£5,189,000	 ,,	£835,800

The monthly average of general business, shown by the dot

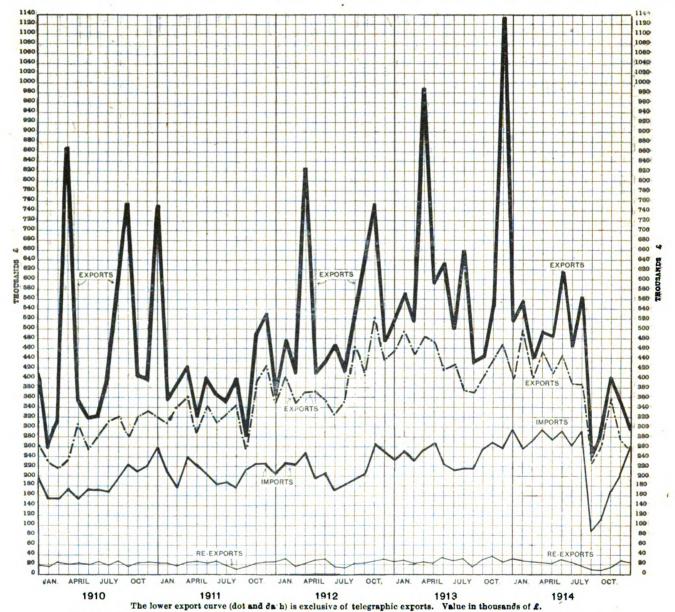

FIG. 1.—CHART SHOWING MONTHLY ELECTRICAL EXPORTS AND IMPORTS DURING THE PAST FIVE YEARS.

no doubt profitably—the normal employment of a large percentage of engineering and even electrical firms, and in the case of the latter a considerable proportion of this normal business—particularly for the home market—has passed to such overseas sources of supply in neutral countries as are available, with the result that the imports of electrical material have shown a rapid recovery to last year's level since August, while British electrical exports, though substantial in amount, show a falling off, which will probably become more marked while our firms are situated as at present.

These features are reflected in the curves which—as usual in January—we reproduce as a convenient summary of the past year's business. Thus in our first set of curves, fig. 1, the total electrical exports from this country (heavy curve) show a decided falling off during the early part of the year prior to the war—the tendency in this direction being mentioned in our last annual résumé. Then came the slump—common to all the curves—which occurred soon after the out-

and dash curve, was, for 1910, £286,000; 1911, £338,000; 1912, £400,000; 1913, £432,000; and 1914, £362,000, but during the first half of the latter year the monthly average was the same as in 1913.

as in 1913.

As regards the imports of electrical material into this country during 1914, the total value shown by our statistics was £2,767,000, representing a monthly average of roughly £230,000, these figures comparing with £2,946,500 and £245,500 in the previous year (1913). Although the past year, as a whole, naturally shows a falling off in values, it should be noted that the first half of the year showed record imports, viz., a monthly average of £275,000.

The re-exports for 1914 were valued at £265,200, or a monthly average of £22,000, as compared with £341,000 and £28,000 respectively in 1913.

Our second set of curves, fig. 2, shows the trend of machinery

Our second set of curves, fig. 2, shows the trend of machinery and cable exports during the past five years, and it will be seen that during the early part of 1914 machinery export values

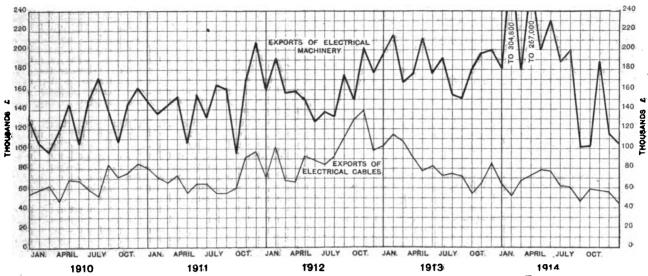

FIG. 2.—MONTHLY EXPORTS OF ELECTRICAL MACHINERY AND HERCYPROAL CABLE—other Than Theegraphic and Telephonic Cable—during the past Five Years.

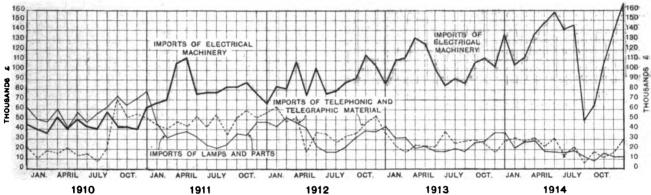

FIG. 3.—MONTHLY IMPORTS OF ELECTRICAL MACHINERY, TELEGRAPHIC AND TELEPHONIC MATERIAL AND CABLE, AND ELECTRIC LAMPS AND PARTS DURING THE PAST FIVE YEARS.

attained record proportions, averaging, in fact, during the period January—June, some £224,000 per month, and over the whole year £179,500 per month, the comparative figure for 1913 being £184,000. The total value of the machinery exports for 1914 was £2,154,000, as compared with £2,209,200 for the previous year.

Cable exports, shown in the lower curve, have declined during the past two years and—it may be some consolation—appear to have suffered to a trifling extent in the early days of the war.

The cable exports for the year—not including telegraphic or

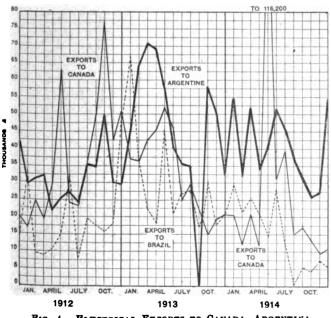

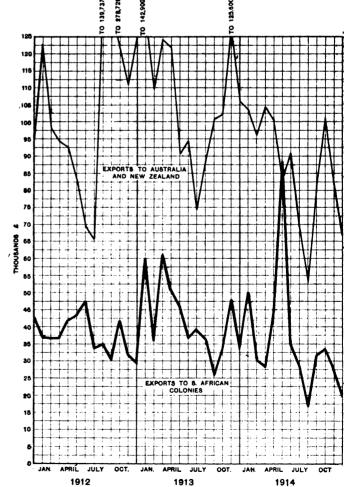

Fig. 4.—ELECTRICAL EXPORTS TO CANADA, ARGENTINA AND BRAZIL, 1912-14.

telephonic cables which are included elsewhere—reached a total value of roughly £741,000, as compared with £968,000 in the previous year.

Curiously enough machinery imports, shown in fig. 3, also attained record values during the first half of 1914, and their rapid recovery in value since the war leaves them in December at the highest level yet reached.

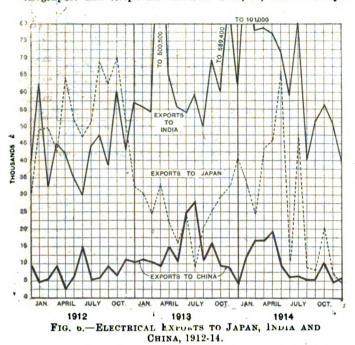

1912 1913 1914
Upper curve includes New Zealand, Australian States, and Tasmania. Lower curve includes Cape, Natal, Transvaal and Orange River Provinces and Rhodesia.

FIG 5—ELECTRICAL EXPORTS TO AUSTRALASIA AND SOUTH AFRICA, 1912-14

Other curves in fig. 3 indicate a continuous falling off in the importation of lamps and parts, which although no doubt largely due this year to the shutting off of German supplies, has been in evidence since 1910, and a similar falling off in telegraphic and telephonic imports.

Electrical machinery imports totalled £1,476,000, imports of telegraphic and telephonic material £267,500, and of lamps

and parts, £215,000, during the twelve months. These figures compare with £1,300,000, £314,000 and £313,000 for the same items respectively in 1913.

Purchasing Countries and Importers into the United Kingdom.

Of the remaining curves, those in figs. 4, 5 and 6 show three years' business with some of our principal customers, with all of whom trade sustained a severe shock on the outbreak of war. Fig. 4 shows that Argentina was our best customer on the American continent, business in that direction being fairly well maintained despite the war. Brazilian trade, which has been declining for the past two years, has dropped off to insignificant proportions since the war, while Canadian trade, with the exception of one or two spasmodic jumps, has been at a lower level than in the previous year.

with the exception of one or two spasmodic jumps, has been at a lower level than in the previous year.

The curves given in fig. 5 of electrical exports to Australia and New Zealand, and our South African colonies, indicate the same general falling off in values over the year as compared with 1913, with a marked kink at the outbreak of war. Fig. 6, dealing with Far Eastern trade, shows that with both India and Japan our electrical business was in a really flourishing condition during the early part of the year—especially so in the case of India, with whom trade has been rapidly increasing for some years—and even Chinese trade showed hopeful signs. In all these cases values tumbled down in August, and while we still retain a reduced though substantial Indian business, and the gross value of exports to Japan during the year was actually higher than in 1913, yet at the present time both Japanese and Chinese business appears to be at a very low ebb.

a very low ebb.

The gross values of our export business to the countries abovementioned for the years 1913 and 1914 were as follows:—
India, £1,769,000 and £784,000; Australia and New Zealand, £1,283,000 and £1,032,000; Argentina, £558,000 and £488,000; South Africa, £508,000 and £434,000; Canada, £392,000 and £318,000; Japan, £399,000 and £320,000; Brazil, £350,000 and £176,000; and China, £159,000 and £117,000.

The last series of curves, fig. 7. dealing with prominent im-

£176,000; and China, £159,000 and £117,000.

The last series of curves, fig. 7, dealing with prominent importers into this country, which have become almost monotonous by reason of the overbearing position of Germany, will be reviewed this year with unusual interest.

Germany did a bumper trade with us during the early part of the year, whether due to accident or design, we can leave to our readers, but following the outbreak of war this naturally fell away to nothing in September, since when there have been no official records of "German" material entering this country. But our American cousins, who in the prehave been no official records of "German" material entering this country. But our American cousins, who in the previous year were showing an increasing interest in our markets, have taken up the running, and are now sending into this country an even greater value of electrical material than Germany did. Under existing conditions this development is not surprising, America being the only really free electrical manufacturing nation at the present time; indeed, her freedom in this respect may be a matter for congratulation to us under the circumstances. the circumstances.

It may be of some interest to record that according to our monthly returns, Germany sold to us magnetos to the value

of over £240,000 during the first seven months of the year; the total value of her electrical imports into this country during this period and a few extra days in August amounted to some £1,133,000, or a monthly average—taken over seven months—of £162,000, as compared with £1,632,000 and a monthly average of £136,000 during the previous twelve months. From the States we purchased electrical material to the value of some £911,000, a monthly average of nearly £76,000, as compared with a total of £593,000 and monthly average of over £49,000 in 1913. £49,000 in 1913.

£49,000 in 1913.

Of the other countries, the Belgian curve shows that her trade has also dwindled to nothing, while France still maintains some small business with us. On the other hand our monthly statistics show that Italy, Switzerland and Holland—neutral countries only partly affected by the war, have increased their business with us since August; the Dutch lamp industry, in particular, has found a market in this country, as also have Swiss and Italian cable, etc.

The electrical imports for the last five months of the years 1913 and 1914, for the Scandinavian countries, Holland, Switzerland and Italy were valued as follows:—1913, £83,000; £14,800; £28,000; and £42,000 respectively; 1914, £52,610; £47,000; £34,000 and £50,000 respectively. The Scandinavian total for 1914 shows a decrease, but Russian business, which was included in the 1913 total, has of course disappeared since

was included in the 1913 total, has of course disappeared since the war started.

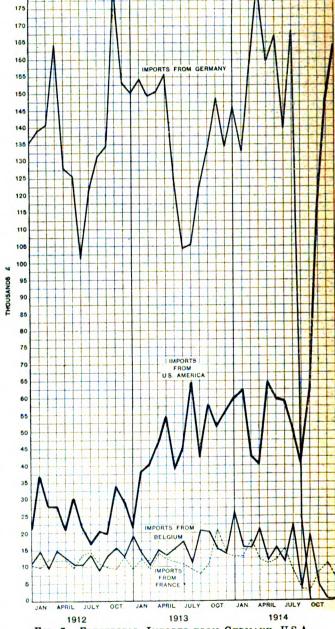

FIG. 7.—ELECTRICAL IMPORTS FROM GERMANY, U.S.A., BELGIUM AND FRANCE, 1912-14.

General.

In concluding these notes, we may point out that the falling off in electrical export business which was indicated in our 1913 curves, continued during the year under review up to the time of the war, and the latter has only been an additional factor in the result. Through the general obscurity in which the future is necessarily veiled, it is not easy to see any improvement in our export business, the indications being that a shortage of both labour and available plant will tend to a further falling off in this direction, as greater numbers of

troops become engaged. And for similar reasons it would seem probable that electric imports from America, in particular, which at any rate has ample copper supplies, will show a corresponding increase, for it will be her object to make up for the shortage of European importation into this country as well as any deficiency in the usual supply of material by British firms to the home market, in so far, of course, as these are not curtailed by the war.

It is, in fact, obvious that self preservation may necessitate our concentrating on war requirements to the exclusion, if necessary, of foreign trade, and it is a matter for congratulation that such drastic measures have not up to the present been necessary.

been necessary.

CAB SIGNALS ON BRITISH RAILWAYS.

(Abstracts of Papers read before the Institution of MECHANICAL Engineers, December 18th, 1914.)

(Concluded from page 126.)

G.W.R. Automatic Train Control and Audible Signal System.

By W. A. STANIER, Assistant Manager, G.W.R. LOCOMOTIVE WORKS, SWINDON.

About the year 1905 some of the Great Western engineers devised an audible signal for the locomotive cab, which, after a certain amount of experimenting, was considered to be simple enough and certain enough to warrant a more extended trial. It was agreed to equip certain branch lines with the apparatus, and as a result the system has had certain improvements, and its use has been considerably extended.

A fixed ramp, in the centre of the track, about 400 yards before the distant signal is reached, is connected to the lever in the signal-box controlling this distant signal by means of an electric wire and switch with a battery in the circuit.

The ramp is laid on the skew so as not to wear a groove in the shoe, and to assist in clearing it, and the shoe which rubs on it, of anything such as frost or snow which tends to insulate them from one another.

late them from one another.

In the signal-box is a switch connected to the ramp with a battery of about eighteen Leclanché cells in the circuit, with an earth return. This switch is attached to the lever con-

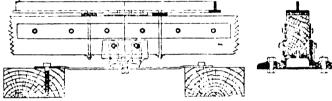

FIG. 2.—CENTRAL PORTION OF RAMP.

trolling the DISTANT signal, so that the ramp is electrified when the signal is at PROCEED and dead when the signal is at STOP. The ramp is therefore dead in the event of the battery

or connections becoming faulty.

The apparatus on the engine consists of a siren and brakeare automatic steam switch.

The contact-shoe is valve, and an automatic steam switch. The contact-shoe is fixed in the centre line of the engine, and projects to within 21 inches above rail level. It is lifted 11 inches whenever a ramp is passed over, opening a switch attached to the contactthe shoe picks up the current, closing a secondary circuit on the engine which prevents the brake-valve from opening, and at the same time causes the bell on the engine to ring. This audible ALL-RIGHT signal continues until the engineman press a push-button on the side of the cab apparatus, thus acknow-ledging the signal, and by breaking the bell circuit stops the

The cab apparatus consists of a box mounted on the side of the cab close to the engineman. It contains an electromagnet, energised from a small accumulator on the engine, which holds up an armature. The armature is integral with the lever that controls the brake-valve and siren. Close to it is a steam-switch. Its object is to cut out automatically the electric battery on the engine, so that when the engine is not electric battery on the engine, so that when the engine is not in steam the circuit is open and waste of current is prevented. It is arranged with a diaphragm which is set to move with about 40 lb. steam-pressure, and when it moves it joins up the circuit in the engine. A selective or polarised relay controls the secondary circuit, which circuit is primarily used for ringing the bell mounted at the top of the box, which gives the ALL-RIGHT signal. This relay is also used when the apparatus is installed on single lines. When a train is going in one direction on a single line it is necessary that the ramps controlling signals in the opposite direction should give no signal. This is effected by electrifying these ramps with a current of opposite polarity. The means for doing this is controlled by the electric staff or tablet apparatus, fig. 6.

The apparatus on the engine is always tested as the engine leaves the locomotive shed, as a short ramp is fixed alongside the outgoing signal for the locomotive yard, so that the engineman satisfies himself that the device is all right before he gets to his train. The device has proved so satisfactory that about 180 miles and 90 engines up to the present have been equipped, and its use is rapidly being extended.

and its use is rapidly being extended.

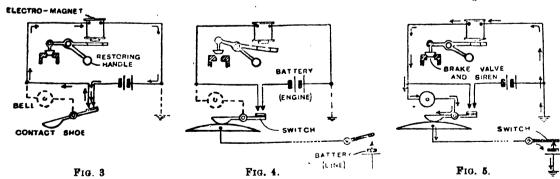

Signalling on Railway Trains in Motion.

By W. WILLOX, Engineer, Metropolitan Railway, LONDON.

Twenty-seven miles of the Metropolitan Railway are electrified, and 23½ miles are governed automatically by track circuits. The rest of the Metropolitan Railway has ordinary lock

trined, and 203 miles are governed automatically by track circuits. The rest of the Metropolitan Railway has ordinary lock and block signalling, with a number of sections automatically controlled by track circuits.

The system of signalling in use on the electrified portion of the Metropolitan Railway is all electric automatic, and this signalling requires no visual indication in the driver's cab. There is, however, a control on the driver by means of "trainstops," which are placed at every stop signal. The train-stop is a device which is controlled by the track circuit in exactly the same manner as the signals, and consists of a short vertical arm which is held vertically in its normal position, and is lowered to the CLEAR position by means of the track circuit acting through a motor at the same time as the signal goes to clear. There is a trigger fitted on the leading motor coach or electric locomotive which would engage with the train-stop in its normal position and so be deflected backwards. When this occurs, it applies the emergency brake on the train and simultaneously opens the power circuit, thus braking the train actuating off the current. In this way, if a driver passes a signal at DANGER, his train is automatically brought to a stand and cannot be started again until the trigger is replaced in and cannot be started again until the trigger is replaced in the vertical position. As showing the effect of these train-stops, it may be mentioned that a train weighing 200 tons running at a speed of 25 miles per hour on the level is brought to a stand in less than its own length.

CIRCUIT DIAGRAMS OF G.W.R. SYSTEM OF TRAIN CONTROL.

The switch is connected with the electrically-controlled brake-valve and siren in such a way that whenever it is brake-valve and siren in such a way that whenever it is opened, except as hereafter described, air is admitted through the siren and brake-valve to the train-pipe, sounding the siren and applying the brakes on the train, figs. 3 and 4. This happens when an engine passes over an unelectrified ramp. The driver can stop the siren sounding, and stop the application of the brakes by raising a handle provided for the purpose, and thus acknowledges the audible stop or DANGER signal given by the siren. Should the signal be in the PROCEED or ALL-RIGHT position, fig. 5, the switch connected to the lever in the signal-box working this signal is closed, and the ramp is electrified, so that when the engine passes over the ramp, These train-stops, although they come to a CLEAR position at the same time as the signals, are controlled by the track circuit independently of the signals, so that if by any accident

circuit independently of the signals, so that if by any accident the signal should remain at the CLEAR position instead of going to DANGER, the train-stop would still go to the vertical position and thus come into action if the train went past the signal. The control for the train-stop mechanism is complete when the respective track-section is unoccupied, and is in shunt with the signal control. After the train-stop motor has finished its work, that is, bringing the train-stop arm to the CLEAR or inoperative position, the motor circuit is opened automatically by means of the motor control. The train-stop is then held in the CLEAR position electrically by means of a clutch (as shown

on plan). The motor only operates for the actual clearing, and the clutch arrangement reduces the power for holding at CLEAR to an almost negligible quantity, 1-10 amp. When the power circuit is broken, the only moving part of the apparatus

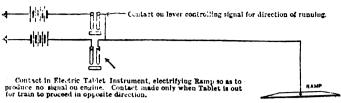

Fig. 6 .- WIRING ON SINGLE-LINE RAILWAY.

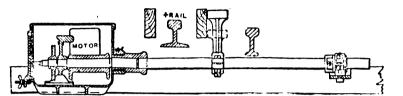

is the train-stop arm and shaft, the motor remaining stationary, this being effected by the clutch mechanism. The voltage of operation is 60 and the power required for clearing about 30 watts, the time taken being five to six seconds.

Fig. 7 shows the general arrangement of the train-stop

ratus took charge of the train; it did not come into operation if the driver kept within the speed limit applicable to the case. A maximum speed limit was enforced in similar manner, and in the event of a signal being at danger, speed was reduced automatically to say 5 m.p.h. Ramps in and at the entrance to curves secured automatic speed limitation therein. This system had been used satisfactorily for some years; the General Railway Signal Co. (Rochester and New York) was to use it in re-signalling the Metropolitan Railway (New York) and the Pennsylvania Railway was about to use it on 20 miles of

Pennsylvania Railway was about to use it on 20 miles of four-track way.

Mr. H. Raynar Wilson was strongly in favour of eab signalling, but doubted the wisdom of attempting sudden wholesale and radical changes in signalling methods. According to his investigations, cab signals had never been recommended by Board of Trade inspectors. (Mr. Wilson laid considerable stress on this point, but a later speaker said there were cases in which Board of Trade inspectors had recommended cab signals.) Notable progress had already been made, cab signals being installed on 90 Great Western, 36 North Eastern, and two Midland locomotives, but to avoid unnecessary expense

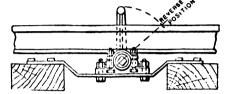

FIG. 7.—TRAIN STOP. METROPOLITAN RAILWAY.

and controlling motor at rail level, and fig. 8 is a diagram of the wiring between the track circuit and the motor, showing

how it is controlled.

With regard to the reliability of the train-stops described, the results are very satisfactory, as there have been many cases of drivers running past the signal, either through carelessness or some failure of the apparatus, being pulled up by the trainstops.

As to its usefulness, it is relied on to such an extent that fog-signalling in some cases has been dispensed with. Further,

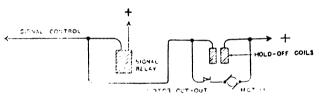

FIG. 8.—DIAGRAM OF TRACK CIRCUIT AND MOTOR CONTROL.

it has been possible to shorten the signal sections, and this shortening has only been agreed to by the Board of Trade on condition that train-stops are provided, and the Board of Trade also requires that all srop signals on the electrified lines shall be fitted with the train-stop apparatus.

Discussion.

In opening the discussion, the Chairman (Mr. Michael Longridge) said that the subject of cab signalling was of enormous importance, as the ordinary system of semaphore signalling left much to be desired. He suggested that audible signals were always more reliable, and that the efforts of engineers should be directed to perfecting a system of audible cabitreelibre.

signalling.

Mr. A. T. Blackall (Chief Signal Engineer, G.W. Rly.) attached special importance to automatic brake application in the event of the signal being at danger; with this system, there was no need for visual signals. Uniformity of system was of the utmost importance; in particular, an engine belonging to railway A should be able to nick up signals on railway ing to railway A should be able to pick up signals on railway B when running over the latter. He agreed that there should be no moving parts in the track equipment for cab signalling. On high-speed lines in particular, it was unsafe to depend on the train hitting a stop moved from a signal-box say half

a mile away.
Mr. S. L. Gibson (Toronto) outlined a Swiss system of signal-Mr. S. L. Gisson (Toronto) outlined a Swiss system of signal-ling and train dispatching (i.e., control from a central office) with which he had had experience in the States. The system was in regular use on 130 miles of track with extensions in progress to 250 miles. A fixed ramp and shoe were used, visible as well as audible signals being given in the cab. Following usual American practice, a green light, i.e., "safety" signal, was shown normally, a red light appearing only between the distant and home signals when danger was present. The ramps were connected to the control station, and in the latter was a record sheet—showing time horizontally and number of "blocks" vertically—on which every train on the system recorded its position accurately and automatically. Only in exceptional cases were trains stopped automatically. In general, control was restricted to automatic speed limitation within predetermined limits: this speed control could not be overcome by the driver. The automatic apparatus was set in operation at the distant signal, and if the driver did not reduce speed within a certain distance, the automatic appara reduce speed within a certain distance, the automatic appaand to reduce the difficulty of securing ultimate uniformity of working, it was desirable to proceed slowly—first repeating distant signals efficiently, then adding stop and route signals

Mr. J. SAYERS (Midland Railway) pointed out that, however useful "train stops" might be on low-speed lines, they were of no value for high-speed steam or electric traffic. In his opinion several recent accidents on the Interborough and Third Avenue Railways could only be attributed to failure of train stops. Allowance must be made for the fact that more or less main-line track would ultimately be electrified, and he believed that it would be found there was no room on the track for main-line track would ultimately be electrified, and he believed that it would be found there was no room on the track for signalling apparatus. At present single-phase overhead traction utilised running rail return, but the speaker believed that the Board of Trade here and the Public Safety Commission in the States would soon insist on a special return circuit being provided, in which case ramp systems of cab-signalling would have to find another means of transmitting signals to the engine. In co-operation with Mr. Acfield he had tried, on the Midland Bailway, a wireless system based on the Railanhana. Midland Railway, a wireless system based on the Railophone

engine. In co-operation with Mr. Acfield he had tried, on the Midland Railway, a wireless system based on the Railophone and operating, through a tuned relay, an audible indicator and the train brake. He submitted that the continuity of visible signals as now used made them ideal if only one could ensure that they could always be seen.

Mr. A. D. Jones (S.E. and C. Rly.) asked whether risk was not incurred by the normal position of the indicating arm being "clear" in the North Eastern system of cab-signalling; and by the driver being able to re-set the cab semaphore and switch out the bell. Did not cab signals take the driver's attention from the track? The critical period between the beginning of a fog and calling out fog-men could be tided over by some apparatus enabling signalmen to place detonators mechanically. Cab-signalling was imperfect so long as it left the possibility of errors due to signalmen, for such errors had been responsible for many accidents; also, the system should include automatic train control, though this must not be in the nature of a sudden train stop in the case of high-speed traffic. Apart from other considerations, an attempt to stop suddenly, say, a heavy goods train on a down-grade would cause trucks to mount the tender. Uniformity of system was of the utmost importance—particularly in such cases of military emergency as now existed, when through-running in every direction, all over the country, was desired.

Mr. Garner Smith said that in his opinion a mechanical as well as an electrical signal was necessary for safety.

Mr. R. G. Berry (L. & Y. Rly.) announced that he had been conducting successful experiments with a system of cabsignalling giving both "all right" and "danger" signals, but requiring no battery or accumulator and no delicate contacts on the locomotive

but requiring no battery or accumulator and no delicate con-

Mr. A. E. Roberts (L. & S.W. Rly.) criticised severely the practice in the North-Eastern system of mounting the brush frame on a truck, which had considerable vertical motion.

Mr. R. J. INSELL (G.W. Rly.) pointed out that the G.W. Rly. system of cab-signalling was as efficient as the N.E. Rly. system in warning drivers of their approach to a signalling zone: the

system of cab-signalling was as efficient as the N.E. Rly, system in warning drivers of their approach to a signalling zone; the G.W. system gave cab signals coinciding with the semaphore signals. Route indications were given only in the case of junctions which could be traversed at 40 m.p.h. or upwards. At most junctions the "danger" signal was given at the distant post in order that speed might be reduced for the junction; route indications were then unnecessary. Train stops were of no use on high-speed steam lines. Modern high-speed frequent-service conditions would necessitate one gysspeed, frequent-service conditions would necessitate one sys-

tem being generally adopted in the near future.

In reply, Mr. Acrield said that no mechanically operated moving ramp could be generally satisfactory. Tests on the

Midland Railway showed that train stops could not stand operation by trains running at 60 to 70 m.p.h. The exigencies of modern traffic demanded that the driver should be able to release himself from automatic braking directly such release became safe, and without waiting for the guard's services. Visual signals, though not necessary where distant signal control was alone practised, were advisable where the home signal was given also.

Mr. Prag (greenlying in the change of Mr. V. I. Der along the control was alone to the change of Mr. V. I. Der along th

signal was given also.

Mr. Pigo (speaking in the absence of Mr. V. L. Raven) said that an important feature of the N.E. system was the showing of one signal till the next was given. The driver was not required to remember what was the last signal. The normal position of the indicating arm was "danger," but the normal running position was "safe" so long as all circuits and contacts were in order. The cut-off switch was used only to save current while locomotives were in sheds: special ramps outcurrent while locomotives were in sheds; special ramps outside the latter demonstrated the correct working of the apparatus on leaving the sheds. The bell switch was for use in shunting; even with the bell switched out, a complete "off" signal was not given because the route indicator remained central. The complete canalisation of the system was very important, and Mr. Raven's system did not lose control of the driver at the distant signal.

Mr. W. A. STANIER said, with regard to acceleration of service by cab signals, that G.W. drivers placed implicit faith in their apparatus and ran dead to time in fogs when trains not equipped with cab signals were seriously delayed. The G.W. Rly. had also tried a purely mechanical audible cabitive suffice surface.

signalling system.

Mr. W. Willox said that when cab signals were sufficiently Mr. W. WILLOX said that when cab signals were sufficiently perfected no doubt they would be used on suburban electric trains. At present train stops were used as being the only means by which such a service as 42 trains per hour on one line could be maintained. In operation they had proved perfectly reliable at speeds up to 40 or even 50 m.p.h.

Mr. A. F. Bound (G.C.R.), in a communication, expressed the view that the existing visual signals must be retained, and any new system must be merely an adjunct to present methods. It was useless to deal with the for-signalling problem: the

It was useless to deal with the fog-signalling problem; the proper course was to provide something which would ensure that the traffic should be worked according to the indications displayed by the signals. The main thing was to prevent a train from passing a HOME signal at DANGER by fixing the control at such a distance from the signal that the train would

be stopped in time.

Mr. H. W. Moore (L. & Y.R.) wrote that the system described by Mr. Stanier appeared to meet every practical requirement, though it only gave a warning at the DISTANT signal.

ment, though it only gave a warning at the DISTANT signal. He thought an automatic appliance should be provided to stop the bell ringing.

Mr. J. C. SYKES thought that the driver should not be allowed too easily to liberate his brake when it had been applied automatically. The duties of the driver should not be added to: he should be allowed freedom of action until he did something wrong, and therefore he thought a properly designed train-stop was the solution of the difficulty. They were putting too much apparatus on the locomotive; the train-stop, however, was simple. The signalman ought to be provided with means to stop a train, in case of need.

THE DEVELOPMENT AND APPLICATION OF SEARCHLIGHTS.

Ar a meeting of the ILLUMINATING ENGINEERING SOCIETY on January 19th, Mr. P. G. LEDGER opened an instructive general discussion on this subject, the paucity of literature relating to which was remarked and regretted by most of the speakers. After pointing out the distinction between beacons which are intended to be seen from a distance and searchlights which are intended to illuminate and reveal distant objects, Mr. Ledger stated that the electric arc was the only source having sufficient intrinsic brilliancy (200,000 c.p. per sq. in.) for highpower maritime work, though bunched incandescent filaments and the half-watt lump were useful for locomotive headlights, fire brigade, aeroplane and other small searchlights. Searchhights were used during the last Franco-Prussian war, but with metal mirrors which suffered from distortion, corrosion and other defects. The perfection of the mirror and optical system generally was the chief improvement which had been effected in the construction of searchlights, and in this connection the work of Fresnel and Mangin must not be forgotten. The candle-power of a powerful searchlight was very indeterminate, varying as it did with the consumption of the carbons and, in effective value, with atmospheric absorption. Tests made in a clear atmosphere showed that the candle-power varied from 4,000,000 c.p. with a projector 40-cm. in diameter, using a 20-amp, arc, to 180,000,000 c.p. with a 150-cm. projector and 150 cm. jector and 150-amp. arc; in the latter case, the intensification factor of the mirror would be about 4,300 and the mean horizontal intensity of the arc in the direction of the mirror about 46,000 c.p. The speaker exhibited a curve showing that increasing the input to searchlights increased the c.p. per watt at first rapidly, but then slowly: corresponding to 0.8, 1.7, 2.75, 4.9, and 9.5 kilowatts were 4, 5, 5.5, 6 and 6.5 c.p. per watt.

Knowing the divergence of the beam (rarely less than 2° or 3°, nor need it be otherwise, or it would take too long to search a given area), the true centre of radiation could be determined given area), the true centre of radiation could be determined and the law of inverse squares applied sufficiently closely to permit a fairly definite value to be assigned to the candle-power. Usually, however, the variety of carbons, current and voltage, and diameter and focal length of mirror, were alone specified. The "range" of a projector was even less definite than its candle-power. Often it was demanded that a projector should show up small objects which could not under any circumstances be seen at the distance specified. Any attempt to specify range must stipulate that the atmosphere be clear and that an object of definite size and colour be visible at a certhat an object of definite size and colour be visible at a certain distance. As a rough guide, a modern 150-amp. searchlight would carry 10,000 yards in clear weather. Nerz's rule stated that the radius of action varied with the square root of the mirror diameter and the fourth root of the intrinsic brilliance of the source; this rule took no account of the size of object viewed.

object viewed.

The coming of aircraft had made it necessary to project beams vertically upwards for military purposes and had raised the intricate problem of arranging for flashing beacons operating in both horizontal and vertical planes. Vertical projection might be arranged by giving the projector barrel the desired inclination; by using a lens, with the arc beneath it, instead of a mirror; or by allowing light from a stationary projector to fall on a mirror capable of rotation in any plane. Yellow or red rays penetrated fog better than did blue light, and there was a possibility of increasing ranges by using coloured light; using a coloured mirror or screen would waste much light. Any improvement with a view to increasing the light available would have to be made by increasing the much light. Any improvement with a view to increasing the light available would have to be made by increasing the brilliancy of the crater; but progress in this direction must not diminish unduly the life of carbons (3 or 4 hours in large and 7 hours in small projectors.) A 100-amp. are using a 27-imm. positive carbon might employ a 13-mm. copper-cored negative and the shadow of the latter, with a relatively long are was inconsiderable. Recent improvements had been in arc, was inconsiderable. Recent improvements had been in respect of rapid dismantling and easy manipulation, e.g., automatic movement of the beam in accordance with the

motion of an observer's telescope.

Mr. J. Eck said that we appeared to have reached the limits of performance with searchlights of the existing usual design; of performance with searchights of the existing usual design; increased current input no longer gave appreciably more light on a distant object. A new type of lamp had recently been produced in the States having vapour-cooled electrodes placed at about 150° to each other. The positive carbon was 15-mm. in diameter and horizontal, the negative was 11-mm. in diameter and inclined. Both carbons were rotated steadily by a small motor which also served to actuate the feed and other movements in the lamp. Flat nozzles delivered methylated spirit vapour on to the carbon tips. The arc crater occulated spirit vapour on to the carbon tips. The arc crater occupied the whole section of the positive carbon, and it was found that with lamps of this type, higher specific illumination and that with lamps of this type, higher specific illumination and a more concentrated beam were obtained than from an ordinary projector of equal size. As compared with a standard projector of the same current capacity and mirror diameter, a projector with vapour-cooled are produced 4.2 times as great average illumination along 238 ft. of are at a distance of 6,800 ft., and 5.2 times as great illumination along 1,238 ft. of are at a distance of 27,550 ft.

Mr. W. M. Morder said that there seemed to be a tendency to revert to the earliest type of are with inclined carbons and both incandescent tips exposed. Was it not possible to use an alternating-current are with inclined and, of course, equally heated carbons, while still keeping a small enough source for accurate focusing? At present the capacity of projectors was largely limited by heating; possibly it would be worth while to water-cool the barrel and mirror.

Mr. Lyon said that oxy-petrol burners incandescing a refrac-

Mr. Lyon said that oxy-petrol burners incandescing a refractory button permitted the construction of very portable self-contained searchlights. For aeroplane use a swivelling searchlight of 2,000 intrinsic candle-power weighed 60 lb. complete with generator, automatic field regulator (compensating for variations in engine speed) and ballast resistance. A Fresnel large way and a cheer of place glass presented ash decepting lens was used and a sheet of plane glass prevented ash dropping on to the mirror. A half-watt signalling lamp with a specially efficient optical system, for aero-work, was also described. A metal-filament lamp of 1 to 1.2 intrinsic c.p. fitted in a parabolic mirror permitted Morse signals to be read in this country, at the rate of 17 a minute, over distances exceeding 11 miles. This was distinctly promising in connection with the use of half-watt lamps for beacons.

Mr. T. RITCHIE regretted the entire absence of standardisamatters. If the barrel instead of the mirror of a searchlight were made, say, 24 in., the mirror would only be about 20 in. in diameter, and £20 to £30 would be saved (or lost) on the mirror alone. Diameter figures should refer to the mirror. It should be possible to draw up standard emission curves and traded emission curves and It should be possible to draw up standard emission curves and standard specifications for the crater diameter as a fraction of the mirror diameter. By increasing from 1 to 5 kw. input, from 4 to 63 c.p. per watt, to the mirror, could be got in modern searchlights, and in the vapour-cooled type 10 to 12 c.p. per watt was obtainable, according to the rate of carbon consumption. Due to this and elimination of the red cone surrounding the crater, a whiter light and greater penetration was obtained: tests showed that gunners could find and hit a target 2 or 3 miles further away, using a projector of the vapour-cooled type, instead of an otherwise similar stan-

dard lamp. The small, heavily worked carbons in the vapour-cooled type could be impregnated without the ill effects noticed when using ordinary current densities. Combustion was better at the higher working temperature, and due to less scattering of the beam the observer could keep within hail of the operator without being dazzled.

Mr. J. W. Willcox gave test data showing the excellent performance of metal-filament lamps in small searchlights (9-12 in. diameter, 22-3 in. focus) required to deliver a relatively small volume of light for pick-up distances not more than 5,000 ft. The multiplication factor of the mirrow was 500 to 1,000 for 8° beams and 3,000 to 6,000 for 5° beams. Due to the sharper focus obtainable, incandescent lamps had been found better than arcs for locomotive headlights.

to the sharper focus obtainable, incandescent lamps had been found better than arcs for locomotive headlights.

Mr. L. R. B. Pearcs suggested that impregnation with strontium salts might introduce unstable resistance conditions and cause "spurting."

A VISITOR stated that the French authorities made a practice of over-running incandescent filament lamps in a certain class of searchlight. By over-running 8 or 16-volt lamps 100 per cent., light could be obtained at # watt per c.p. The lamps lasted only one or two hours, which was quite sufficient for the purpose in view. Was it not possible that the use of several lamps concentrating on one spot would overcome the limitations of a single beam?

Mr. H. SMITH quoted some of the conclusions reached in

limitations of a single beam?

Mr. H. SMITH quoted some of the conclusions reached in recent military searchlight investigations in America. By altering the shape and composition of carbons, 50 per cent. increase in light could be obtained. Coring steadied the arc and gave the crater the right shape and brightness. Though yellow rays penetrated farthest, it was no use trying to make yellow light. It involved a flame arc which fouled the mirror, choked operators and spoiled focus: the loss was greater than choked operators and spoiled focus: the loss was greater than the gain

the gain.

Prof. Blondel (communicated) stated that existing methods of specifying range were too vague and empirical. Atmospheric absorption varied greatly in different districts and complete over-land data were not available. He gave mathematical expressions and lists of numerical factors and relevant physical data, and made allowance for the sudden decrease in visual acuity occurring when illumination falls below 0.15 metre-

acuity occurring when illumination falls below 0.15 metre-candle.

Mr. J. S. Dow pointed out that there were sound physical reasons why blue rays should be excluded from searchlight beams. Not only had they poor penetrating power, but also their dispersion produced a blue-white haze very objectionable in practice. Better definition of distant objects could be obtained if blue rays were excluded.

Mr. Chalmers said that Nerz's range formula neglected to account for the distance of the observer; this was not permissible if the object viewed subtended only one or two minutes of are at the observer's eye. So long as glasses of moderate magnifying power were employed, small objects could be seen at as great range as large objects viewed by the naked be seen at as great range as large objects viewed by the naked

eye Mrs. Hertha Ayrton said that previous speakers had almost

Mrs. Hertha Ayrton said that previous speakers had almost ignored the question of arc stability, which was extremely important and depended on many factors. The supply generator used should give 15 or 20 volts excess pressure, on open circuit, above that required at the arc. Six years ago she had sent to the Admiralty drawings of the shapes to which carbons should be cut: this information had not been applied, but the recent American investigations again showed its importance. In investigating the best running conditions, the speaker had found 120 amps. at 70 volts on the arc, using a 33-mm. solid positive, had given a long and stable arc with 20 per cent. more light than usual. Best results depended largely on the operator's skill.

Mr. A. P. Trotter said that the practical operation of search-lights was very simple, whereas to express their theory mathematically was difficult and unsatisfactory. So many arbitrary constants were involved that there was little theory left by the time one had evolved an accurate formula. Residents in London had pightly opportunity of observing what splendid the time one had evolved an accurate formula. Residents in London had nightly opportunity of observing what splendid beams were obtained from modern searchlights. As a matter of fact they showed less divergence than was dictated by theory. Any attempt to express and work with the candle-power of a searchlight was unsatisfactory. The only satisfactive of light and the of light candless the search of the candless of light the search of the original search of light candless of l tory method was to deal with lumens and flux of light.

ELECTRICITY SUPPLY.

On Wednesday evening last week, at a meeting of the Students of the Institution of Electrical Engineers, Mr. Charles H. Merz delivered an extremely interesting lecture on the subject of electricity supply on the large scale in populous areas, illustrating his remarks with lantern views and diagrams. By virtue of the positions he occupies and the unique experience that he has acquired, the lecturer is exceptionally well equipped for dealing with a subject which we may regard as his speciality, and it is to be regretted that the reproduction of his lecture in extenso is

not permissible.

In the first place, Mr. Merz established by logical processes the fact that the interconnection of several large adjoining areas for the purpose of supplying electricity was essential to reliability combined with economy; each area can receive a supply from at least two directions, and instead of having a separate stand-by plant in each generating station, the whole of the stations become mutual guarantors of the continuity of supply. of the same total rating then gives a greater degree of reliability than would otherwise be attained, and, roughly, we may say that with n stations working together, the individual generating sets may be n times as large. This, of course, results in a great reduction in capital cost, as well as in steam consumption. Generating sets of 25,000 kw. capacity have already been put to work, with excellent results, and Mr. Merz, who is accustomed to thinking in large units, sees nothing to prevent the installation of 50,000-kw. sets at no distant date.

Another result of interconnection is improved load factor, and the lecturer, showing maps of the North-East Coast network, by far the largest example of the kind in this country, gave startling figures for the load factor attained in that area. It must be admitted that the region in question, with its enormous industrial demand for electric power, possesses exceptional advantages from this point of view. The remarkable development of the so-called "waste-heat" station system was well illustrated by statistics and diagrams; but here again the district is quite exceptional in character. It is worthy of note that a company, free from the trammels that embarrass municipal undertakings, was able to carry out this huge system, which would have been impossible in the case of a municipality.

Amongst possible openings for the further development of electricity supply, and the improvement of the power factor, the lecturer referred especially to electric traction on railways, which has already made considerable progress on Tyneside, and he pointed out that there is a tendency to advocate electrification for suburban service only, on account of the advantages of electricity where there are frequent stops; but the economy of electric traction does not depend on the stops, but on the density of the traffic, and Mr. Merz. emphasised the fact that a material saving can be effected on a railway of any length whatever, without regard to stops, if the traffic is heavy and continuous. The mineral traffic on some branches of the North-Eastern Railway fulfils the conditions, and the new electric service with overhead high-pressure supply to the locomotives, which will soon be inaugurated by the company on one of these lines, is expected to prove highly economical.
Some doubt, he said, had been cast upon the effect of

diversity of demand upon the load factor of a large power station, but he met this not only by reference to the results achieved on the North-East Coast, but also by a telling satire upon the conditions at present obtaining in the London area. When practically all requirements are filled by electrical means, it will obviously be impossible for all

the demands to occur simultaneously. If the present "system" were perpetuated, a suburban resident would have his breakfast cooked by electricity from one power station, and would travel to town in a train propelled by a second; his office would be lighted and heated by a third, and, as likely as not, his lunch would be cooked by a fourth, while his tramway journeys during the day would be energised by a fifth. In the evening possibly he would travel to the West-End with power from a sixth station, attend a theatre supplied from a seventh, and sup at a restaurant connected with an eighth. This absurd partition of the load would be avoided if all the supply were derived from one homogeneous interconnected system, and the benefits of the diversity factor would then be fully realised.

There can be no doubt as to the disadvantages of the present methods; the difficulty lies in finding a satisfactory way of co-ordinating the numerous systems, and the County Council finds that it has tackled a very thorny

We understand that Mr. Merz looks forward to the development of electricity supply in London to something like 15 times its present volume; Sir John Snell guardedly hinted at 10 times, and we are inclined to think that Mr. Merz's estimate is somewhat biased on the high side by his experience on Tyneside, the industrial demands of which are much heavier than those met with in the London area. But there is certainly scope for enormous developments in connection with the domestic uses of electricity and electric traction, and we hope that eventually Mr. Merz's figure will be justified by realisation.

THE strength of the copper market has Copper. been unabated within the past few weeks. and it is by no means certain that the advance, important though it has been already, has yet spent itself. excellence of the trade demand is admitted on all sides, the major portion of the buying coming from the brass section, which is unprecedentedly busy on ammunition orders, mainly for home needs, but also in part for the Allies.

An enormous consumption of copper is proceeding in connection with the provision of munitions of war, and there is not the smallest chance of all our efforts being abated to furnish the huge armies in the field with ample supplies wherewith to drive back the baby-killers and thieves who are endeavouring to lay waste the whole of Europe. Producers have fully recognised the strength of the position arising from the big demands which are encountered, and have raised their prices by steady and successive stages, until now they are in the neighbourhood of £68 10s. a ton for electrolytic. Very large business has been booked within the last three weeks or so, and the demand is still in evidence. Not only has the call for copper from Europe been important, but there has been a revival in United States home trade buying, and under the joint influence of the domestic and export demands, the stocks of refined metal in first hands across the Atlantic have been drawn upon to such an extent as to threaten a moderate degree of scarcity.

It had been suspected for some little time that a part of the buying of standard copper in the open market came from America, and this has now received confirmation. It is known that leading American producers have bought largely of warrants, and are contemplating the shipment of several thousand tons of rough copper from British warehouses to their refineries on the Atlantic seaboard of the United States. The assertion is made that it is only by securing material available here, that it will be possible for them to fulfil their engagements, for the supply of copper suitable for the refineries to run upon has been pretty well exhausted across the Atlantic. It remains to be seen whether the position has not been overdrawn in this respect, but meantime there is at least an even chance of the bulk of the rough copper at present available for the use of British refiners being shipped to North America for conversion into electro copper, which material will in the fulness of time be shipped over to us. The position is not liked,

however, and the British Government have for the time put a step to the shipment, though it is possible that the

embargo may be removed in a few days.

There are vague reports that output is to be increased in America, and if the position in respect of rough copper is as described, it is indeed high time that mine and smelter production there was increased. It is sheer nonsense for the pro-German element in the United States to howl about British naval activity in stopping exports to Germany, and to allege that we incidentally are half paralysing business in the Montana mining camps, when the said mining camps are not permitted to produce sufficient copper to supply present needs. However, logic forms no part of the stockin-trade of the pro-German.

The European visible supply on January 31st was 35,125 tons, against 86,308 tons on January 15th, and 35,482 tons on December 31st. A year ago the total was 25,944 tons. The supplies coming forward during last month totalled 35,502 tons, made up as follows:—North America 22,520 tons, Spain and Portugal 2,132 tons, and other countries 4,233 tons, the shipments from Chile being 4,617 tons, and those from Australia 2,000 tons. The deliveries were

35.809 tons.

Electric Nitrogen Furnaces.

THE paper describing his three-phase electric furnace for the direct fixation of atmospheric nitrogen, which Mr. E. Kilburn Scott recently read before the

Society of Chemical Industry, brings once again into prominence the problem how best to establish in this country an industry of such national importance as the manufacture of nitric acid. The derived salts of nitric acid, such as nitrate of lime or sodium and ammonium nitrates, are not only of value as fertilisers, but with the acid itself they form the foundation of the manufacture of explosives, and that we, as a nation, should be content to rely on oversea supplies for so vital an element of national defence is a state of affairs that calls at least for earnest consideration.

It has already been established by the successful operation of the Birkeland-Eyde, Schönherr-Hessberger and Pauling furnaces in Norway and elsewhere, that the direct method of fixing nitrogen by "burning" it in the electric arc can compete on the one hand with the old Chile saltpetre method, and, on the other hand, with the more indirect method of obtaining it from the air by means of calcium carbide and calcium cyanamide or the Ostwald contact process, although the possibilities of the latter method have by no means been gauged as yet to the full. Great Britain to be sure cannot develop water power either to the extent or for the price at which it can be obtained in Norway, but against this has to be set the saving in freights involved in shipping the liquid acid to this country, or in sending the ammonia liquor over to Norway, there to be converted into ammonia nitrate and shipped back again here in that form. The present yield of the nitrogen furnaces in practical operation is stated to be equivalent to some 60 to 70 grams of pure nitric acid per kw.-hour. If the results which Mr. Kilburn Scott's new furnace has given in the experimental stage are reached on an industrial scale, his yield should attain the high figure of 90 to 100 grams of acid per Kw.-hour, an advantage which, even if it stood alone, would weigh heavily in the scale against the superiority which Norway's natural gifts afford her. The fact that the increased yield is very largely the result of employing the hotter flame of a three-phase instead of a single-phase arc furnace, the inherent simplicity of the new furnace, and its smooth working on the small scale, are strong reasons why the increased yield should no less be realised in practice than in the laboratory.

The whole question, apart altogether from the merits of one particular process, has a broader aspect from the point of view of the conservation of power. The utilisation of of view of the conservation of power. the idle hours of central power stations for the running of auxiliary power-consuming chemical processes is constantly being urged by progressive engineers. The situation created by the war affords an opportunity for progress in this direction, which should be at once seized, both by the power producers and the power consumers. The manufacture of

nitrates is only one among quite a considerable number of electrochemical and electrometallurgical processes which can be developed as well in this country as they have been on the Continent, if one can only bring about the necessary coordination between the different interests concerned. discussion of this matter is one which our great engineering societies are in a pre-eminent position to initiate and to

EVER since the commencement of the Alien Enemies present war commercial men and their and Legal legal advisers have been in a state of con-Rights. siderable doubt as to their rights and liabilities in dealing with a'ien enemies. Some difficulties were resolved by special Acts of Parliament and certain Royal Proclamations; but it was reserved to the Judges to declare the rights of an alien enemy as a suitor in English Courts of Law. As a result of certain cases recently argued before the full Court of Appeal, the following principles have now been authoritatively laid down :-

1. The term "alien enemy," when used in reference to civil rights, does not mean a subject of enemy nationality, the test not being nationality, but the place of business; in other words, not nationality, but domicile.

2. An alien enemy has no right to sue in the King's Courts during the war except by special licence or authorisation of the Crown.

3. An alien enemy can be sued in the King's Courts during the war, and, if so sued, may appear and defend, and, if defeated, may appeal.

4. A plaintiff, being an alieu enemy, against whom judgment has been pronounced before the war, cannot present or prosecute an appeal during the continuance of the war.

There are some points about these principles of law which are likely to surprise the non-legal reader. In the first place, it seems that a man of German birth, whether a registered alien or not, is not an alien enemy, and can enjoy all the rights of a British subject, if he happens to be living in England. On the other hand, a loyal British subject who happens to be interned in Germany or Austria at this moment, must be regarded as an alien enemy. If he were in a position to communicate with his solicitor in London he could not issue a writ. On the contrary, a German merchant in London who could still sing with heart and voice :

Ich habe mich ergeban, mit Hertz und mit Hand, Dir Land voll Lieb und Leben, dir Deutsches Vaterland! may still sue and recover money in the King's Courts.

t is possible that many of our readers, at the outbreak of the war, had money owing to them by German firms. If those firms can be sued it were well to bring suit at once; but there are two difficulties :-

1. The difficulty of effecting service of proceedings.

2. The difficulty of recovering anything if the suit is successful.

However, if there are any assets in this country and a manager who is in control of them, something may be gained by the institution of proceedings.

ALTHOUGH only issued at the beginning

German of January, the report on the trade Trade in of Germany in 1913 by Sir Francis 1918. Oppenheimer, British commercial attaché in Berlin-to which we briefly referred a fortnight ago, and of which we give an ample abstract on another page to-day—contains a mass of information which is worthy of careful study by British firms who are engaged on the promotion of the export trade in general. The report mentions, in the first place, that there is hardly a branch of manufacture or trade which has not its own organisation and journal, and thus the conditions of the home market are said to be fully disclosed, whilst news from abroad is published and carried into distant workshops. As in pre-As in previous reports, so in the present one, is the question of syncates discussed at length. The well-known fact is pointed out that the huge works which have each concentrated under one roof, particularly in the coal mining and iron and steel trades, various stages of manufacture have little

interest in the various syndicates controlling the respective stages of manufacture unless they are granted preponderating figures of allotments. On the other hand, the smaller works naturally prefer a state of syndication which guarantees their existence, checks competition, secures steady wrices. in the home market, and provides export bounties or the foreign orders. The huge undertakings have become world concerns; they embrace so many branches of manufacture and command so many markets as to reach above local in-The rise of the gigantic works, although it dustrial tides. has been greatly assisted by modern developments of the banking system, is chiefly attributed to the application of science to manufacturing by carrying the science of the utilisation of by-products to its utmost limits, and therefore reducing the cost of produ tion. The huge concerns, of which every industry boasts increasing numbers, exercise a steadying influence on the country's economic life, because their interests are world interests. desire for high figures of allotments time the appears to act as in the syndicates 8. temptation to the expenditure of vast rums upon extensions which no one expects to see permanently utilized. The result is an enormous augmentation in the productive capacity, and actual over-production shortens the period of a boom and leads to a forced export trade. export trade, which alone is capable of feeding the extended works, may even grow, while the strength has gone out of the boom, notwithstanding a record export trade, as in 1913.

The report, proceeding to state that the desire to save expensive labour has naturally led to an increased use of machinery, records a very interesting point. It is that the Germans, instead of being so willing, as in the past, to agree to customers' special requirements, are having a scramble for orders for standard patterns, it having become difficult to find makers who will accept stray orders for goods which differ from the ordinary patterns. Coming to consider the question of export markets, the report recalls, more particularly from the second half of 1913, the fact that the necessity for a larger German export seemed uppermost in the public mind, and that two scientific institutions were formed early in 1914 to teach the science of international trading. The export trade receives practical official support, export railway rates have been reduced, and cable rates for weekend messages were also lowered to a number of ecuntries early in 1914, whilst foreign loans are made subject to the grant of commercial concessions. In addition, the export trade is supported by the shipping companies, a uniform-bill of lading was agreed upon at the close of 1913, and manufacturers, merchants, and shippers have combined to form special foreign trading societies, which now exist individually for Greece, Turkey, Argentins, Brazil, South America generally, Russie, France, the Balkans, Austria, Hungary, Italy, and Roumania. These societies, which have the moral support of the highest official circles in Germany, formed themselves into a union early in 1914, so as to benefit mutually from each other's experience, and they intend to centralise their labours in regard to statistical and other material to be collected in view of negotiations for the new treaties of commerce. Finally, the foreign trade is facilitated by the existence of 17 foreign banks which have branches in different parts of the world.

The foreign trade in machinery and electric I manufactures is briefly referred to towards the end of the report. The value of the imports and exports, accepting one mark as the equivalent of a shilling, is recorded as follows:-

Exports. 1913. Imports. 2. 1918. 1912.

Machinery .. £3,850,000 £4,050,000 £31,515,000 £33,915 000 Electro technical products 520,000 650,000 11,985,000 14,525,000

It appears that out of the total exports of machinery in 1913 a quantity of 19 per cent. of the weight was forwarded to Russia, 11 per cent. to Austria-Hungary, 10 per cent. to France, 7 per cent. to the United Kingdom, and 5 per cent. each to Belgium, Holland and Italy. In con-

clusion, the report mentions that the export trade in electrical products to Austria-Hungary, Russia, France, Italy and Switzerland is being rendered increasingly difficult owing to the rise of local industries which are being developed

under the local system of protection.

MODERN WIRING WORK, PARTICULARLY IN BAD SITUATIONS.

By H. C. TOFIELD.

Systems of wiring for electric light and power installations are of interest to many, and with some lifteen years' experience in designing and supervising the erection of installations of all kinds and under nearly every condition of service, the writer may claim some knowledge of this important subject.

At one time it was considered that a good class installation of screwed, galvanized conduit would satisfy the requirements of almost any position. It was, so to speak, the last word in wiring practice and was expected to protect the wires under all circumstances.

From the point of view of mechanical protection it was generally a success, but from other considera-

tions frequently a failure.

Since the advent of what are known as cab-tire sheathed (C.T.S.) wires and cables, which are now made by several eminent cable manufacturers (although it seems only fair to state that they were originally designed for this purpose by the St. Helens Cable and Rubber Co.), wiring methods in what may be termed "difficult situations" have undergone a radical change.

Notwithstanding, however, the remarkable advantages afforded by this C.T.S. system of wiring, comparatively little seems to be known about it either in regard to published descriptions of work done, or by many of the consulting engineers and contractors. These people still specify and use the older systems of wiring for work that could be dealt with much more effectively and cheaply by the C.T.S. type.

So the writer, having used this class of cable for a number of installations, principally in and around the Black Country, where, it will be admitted, conditions are exceptionally severe, and having installed it in chemical works and similar places where it has afforded the most gratifying results, considers it will be to the public interest to publish some notes upon this class of cable, and hopes they will not be taken for a mere write-up of a comparatively new article.

A short description of the methods of wiring and the types of accessories used with the C.T.S. system should be of interest to all those who are called upon, from time to time, to provide an electrical installation which will be proof against the effects of moisture and corrosion.

The principal defects of the ordinary systems of wiring, when installed in unsuitable positions, may

be briefly summarised: -

Wood casing.—Casing should only be used in conjunction with vulcanised rubber-covered wires under ideal conditions and where the premises to be wired are perfectly dry. It is prohibited under the I.E.E.

rules for damp situations.

Screwed conduit.—Screwed conduit when installed with proper inspection fittings and galvanised where run in wet situations, affords a sound protection to the V.I.R. wires against mechanical damage and dampness. It will not last for any length of time in chemical works or where other certain manufacturing processes are being carried on. It is also susceptible to condensation, which is another objection to its use in many situations. Water condensed inside the conduit, due to changes of temperature, and rust, rot the insulation on the wires and it then becomes simply a matter of time as to when leakages will take place, the period being governed by the quality of the wires installed and the amount of moisture present.

Lead-covered wires.—If V.I.R. and lead-covered wires are used in wet situations where traces of acid are present, the lead covering is quickly attacked and destroyed. It is particularly affected by elec-

trolysis, and careful earthing of the sheathing must be carried out in order to prolong its life in this respect. Oil impregnated paper and lead-covered wires, as sometimes manufactured for house wiring, have been used in dry situations with success, but if the lead sheathing is injured they become useless. Under certain conditions the lead covering gradually crumbles away, especially where ammonia is present. Lead is likewise seriously affected when secured to damp brickwork and buried in new plaster. When lead-covered wires are used, very careful handling and skilled labour in erecting and jointing are necessary.

Cased wires.—V.I.R. wires cased in either tinned copper or soft metal suffer from most of the defects of lead covered wires, moreover they require a number of special accessories and wiremen experienced in the particular system to erect same. They are very subject to mechanical damage and where run in plaster require suitable protection. In chemical works and all similar situations they are useless.

works and all similar situations they are useless. General.—The above remarks only lightly touch upon the defects of the various systems enumerated, but they are sufficient to indicate that when any of them is used under adverse conditions, trouble with the installation will be experienced sooner or later.

The introduction of a system which would be suitable for all situations has, until lately, been considered an object almost impossible of attainment, and this will not occasion surprise when it is borne in mind that such a system must also be capable of satisfactorily meeting the requirements of any type of installation met with in practice.

The private house, public building, factory, and works each call for special treatment and as in many cases nowadays severe atmospheric conditions have to be contended with, it is a matter of no small difficulty to provide a method of wiring which will be equally effective under all circumstances.

In many situations, more especially in certain manufacturing works, the conditions are so varied that the achievement of one object defeats another.

Assuming all technical difficulties to be overcome, it is a great advantage to be able to employ a method of carrying out the work which will substantially resemble the means adopted when erecting casing, conduit or lead-covered wires, so that any competent wireman, without previous experience in the new system, can install it in a satisfactory manner and within a reasonable time.

Extensive deviations from the systems with which the workman is acquainted saddle the contractor with the expenses occasioned by his permanent staff having to acquire the necessary experience of the new method, and when pressure of work demands the employment of additional labour, he is at a still greater diagraphy.

greater disadvantage.

The C.T.S. wiring system presents no difficulty in this respect, for it is practically identical with V.I.R. and lead covered wiring, so far as the simplicity of installing it is concerned, while it has the additional advantage that the wires may be very roughly handled and bent in any shape required without impairing their insulating and other qualities.

Wherever used, in the writer's experience, it has proved most successful, not only where it was adopted for house wiring and ordinary workshop installations, but where used in positions in which nearly every other system had been tried in the past and had failed.

The details of C.T.S. wiring may be briefly enumerated as follows:—

When used in wet and corrosive situations.—I. For working under the most severe conditions it may be depended upon to meet every possible requirement and, in the writer's opinion, will outlast any other system of wiring.

2. The fittings required in connection with this class of wiring are a novel form of corrosion-proof

junction-box (used for the purposes of jointing or looping the wires when necessary), a special type of corrosion-proof switch, and a lamp holder. These accessories must not be confused with the usual type of so-called acid-proof fittings, as the C.T.S. type will fully protect the ends of the wires against all outside corrosive influences. Ordinary good quality watertight ironclad distribution boards and mainswitches can be used and the cases of these should be drilled as required to take ebonite glands. the addition of a simple form of ebonite cleat, the system may be said to be complete and no further special accessories of any kind are required.

3. The wiring of an installation can be carried out by any competent wireman without previous experience of the C.T.S. system, and in less time than most

other systems require.

When used under ordinary conditions.—1. For private house, workshop and factory wiring in dry situations, it provides a first class installation without the use of any special accessories, but a novel type of patented ebonite junction-box can be obtained in order to save looping the wires down to switches, &c. The wires may be run either concealed in floors, down partitions and behind wainscotting or, if desired, on the surface. They can be safely buried in plaster or laid direct in the ground, and they are equally impervious to moisture, acids, or chemical fumes, while vermin appear to ignore them.

2. All ordinary switches, ceiling roses, distribution boards and other accessories can be used.

3. The saving effected in running the wires, owing to there being neither casing nor tubing to erect nor special fittings to assemble, is at once apparent.

From the above remarks it will be clear that a system of wiring is provided which will satisfactorily cope with almost any condition that can arise in

practice.

Comparison of Costs.—The cost of installing C.T.S. wires complete with ordinary accessories will compare favourably with any other good class wiring system, and the labour costs are specially low where C.T.S. wires are used for wiring buildings in course of construction and existing buildings where all work is required to be concealed, and therefore cutting away is entailed.

The following table is intended to give an idea of the approximate cost per point controlled by one switch for wiring carried out with various systems Pendants, lamps and under average conditions.

shades are not included.

Cost	er p	oınt.
	8.	d.
1. Heavy gauge screwed conduit	21	0
2. Brazed light gauge slip conduit with continuity		
fittings	14	6
3. Close joint ditto	10	6
3. Close joint ditto	13	-
5. Ditto in dry positions	10	6
6. Stannos wiring used as concentric earthed		•
return system	12	6
7. Ditto run as two separate conductors with		٠
copper sheathing as protection	22	٥
8. Casing and V.I.R. wires	$\overline{12}$	
9. C.T.S. wires run in dry situations with ordinary		٠
accessories		6
10. V.I.R. wires run on porcelain cleats	g	ĕ
11. Twin V.I.R. and cotton-covered flex on button	·	v
insulators	R	6
the above foreres can only be approximate		٠,

The above figures can only be approximate, and they will vary very considerably according to the

kind of fixings available.

The ease and rapidity with which C.T.S. wires can be run under floors and inside partitions, also on brick walls which are to be plastered, are exclusive features of this system and a revelation to those who have used lead covered and similar systems requiring a multitude of fitments. And, as labour is the chief factor in estimating for work, since there is usually very little difficulty in computing the material required, this important point will appeal favourably to prospective users.

(To be continued.)

CORRESPONDENCE.

Letters received by us after 5 P.M. ON TUESDAY cannot appear until the following week. Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

200 Telephone Electricians Wanted.

Your courtesy in putting my letter in your issue of January 1st, when I asked for some telephones for the Royal Artillery, has been rewarded, and I have been able to get in touch with several people who are providing the necessary instruments. May I ask you to help further, and insert an advertisement for men in the following

help further, and insert an auvertisement and form?

"200 telephone electricians wanted by the Royal Field Artillery for enlistment. Age 19:38; for three years or the duration of the war, or six years with the Colours and eight with the Reserve. Capable of repairing telephones and lines under fire. Will be taught Morse code and to ride. Army rates of pay at present prevailing. Must be able to pass usual medical examination.

"Apply in writing, stating age, height, qualifications and experience, to the Secretary of the National Service League, 72, Viotoria Street, S.W., who will provide railway pass warrants for suitable men. Envelopes must be marked:—'Telephonists.'"

R. MacLeod,

Secretary, National Service League.

Secretary, National Service League.

Jowers Protective Leakage Device.

Jowers Protective Leakage Device.

Mr. Ernest F. Butler's letter in your issue of the 22nd inst. contains one or two mis-statements which we should like to correct.

We would beg to point out that this device is so arranged that on the occurrence of a leakage current the starter is automatically brought to the "off position and mechanically locked in that position until the starter cover has been taken off and the mechanical interlock removed. Once this has occurred, therefore, it is not possible for the "heedless operator" to make persistent efforts to start up the motor with a fault on it, as the starter arm is locked mechanically. It is not necessary, therefore, to bring the starter to the first contact; in fact, it is impossible to do so.

The maximum current which can be broken on the first stop of the starter is, of course, limited by the starter resistance, and we place. The point to remember is that the starter arm is locked off mechanically.

It is not claimed that the device is a perfect one to deal with

It is not claimed that the device is a perfect one to deal with every possible condition. Practical experience, however, shows that it deals with a very persistent cause of trouble, as follows:

A fault develops on the motor which causes the overload release on the starter arm to operate. The user immediately starts the

motor up again, and keeps on doing this until more serious trouble results. With this device, however, he is prevented from doing this, as the arm is mechanically locked off. His instructions then are to pull the main switch out and report the matter to the works, and a proper electrician looks into the matter and remedies

The device is intended for those cases where motors are installed on premises where a competent electrician is not always available, and it is believed that starters fitted with this device will have a great advantage over the practice hitherto followed.

The General Electric Co., Ltd. A. BAILING, Director.

Birmingham, January 27th, 1915.

A.C. v. D.C. for Lighting.

I have read with considerable interest and much wonder the

I have read with considerable interest and much wonder the series of statements made in Mr. Fowler's letter of the 23rd inst., published in your issue of to-day's date.

It would be a great relief to all classes of electrical workers if Mr. Fowler could explain fully his recond paragraph. It seems to me that the question of the number of live wires is independent of the type of supply—unless an earth-return is used. If this rather unsatisfactory expedient is used, surely less trouble is likely to be experienced from the use of a low-voltage alternating current than from the continuous current with its attendant electrolytic tendencies. electrolytic tendencies.

As to the cost of the installation—on any but installations of comparatively large size, the branch cables are selected more from the view point of mechanical strength than from current-carrying

the view point of mechanical strength than from current-carrying capacity, and consequently the increase in cost due to the lower voltage will be small, except in the case of the main cables.

Mr. Fowler's experience with metal-filament lamps would seem to have been obtained with the older "squirted-filament" lamp, as a very wide experience shows that the drawn-wire lamp is certainly not excessively fragile. But any wire, however well made, is naturally increased in strength when it is increased in diameter, and so it stands to reason that the lower-voltage lamps are fundamentally stronger than the higher-voltage lamps of equal candle-nower.

mr. Fowler's knowledge of the conditions of service of metal lamps is amply indicated by the "hedging" which takes place in the latter part of his third paragraph. After having stated that 250-volt lamps are better than 110-volt lamps, he qualifies this by his reference to "traction lamps"—which are only made up to 125 volts. 125 volts.

Admitting the trouble caused by A.C. circuits in conjunction with accumulators—which I cannot see affects the lighting question (except in private supply stations)—my own opinion is that for general "handiness" for lighting purposes, low-voltage A.C. supply is by far superior to high-voltage D.C. supply. When the matter is considered from the point of view of the Electric Supply Co., the advantages of the former system become even more apparent. even more apparent.

The final sentence of the letter under discussion needs no comment, as it is a reiteration of the second paragraph.

C. A. Hall.

Monkseaton, January 28th, 1915.

I have read with interest Mr. Fowler's letter in your issue of January 29th, 1915, re lighting installations on the above systems, and would like to offer a few remarks on what Mr. Fowler points out as being the chief trouble with regard to A.C. supply.

Referring to the second paragraph in his letter on A.C. supply, his contention is that there are always two live wires at the point of entry into any room, and that there is always one terminal fully alive, even when the single-pole tumbler switch is off. I presume that by being "fully alive," he means alive at a potential above earth (qual to the supply pressure. This difficulty can easily be overcome by permanently earthing one side of the system, and always seeing that the switch is connected in the live side of the circuit.

Take, for instance, a case where three-phase, four-wire, L.T. distribution is in operation, with the neutral or star point permanently earthed, and assuming a two-wire, single-phase lighting supply taken from it, I fail to see why a single-pole tumbler switch, connected in the live side, will not make the circuit dead or at earth

Farther, with reference to the last sentence in his letter, re D.C. supply, I suppose when he speaks of the live side of a D.C. circuit, he means the outer of a three-wire D.C. system, and the dead or harmless side the neutral of the same system, which is rendered so by permanently earthing at the supply end. What is possible with D.C. in this respect is possible with A.C., as is proved by the extensive use of Stannos copper-sheathed concentric cable for lighting installation work. When installing this, the inner or insulated conductor in a circuit is used as the live or switch wire. insulated conductor in a circuit is used as the live or switch wire, and the bare copper sheath or outer conductor is used as the neutral or dead side of the circuit, and is bonded and permanently connected to earth; in many instances, it is laid direct in the plaster on the walls.

I trust Mr. Fowler will agree that what I have said is quite feasible, for I can assure him that the above is now, in operation in

many towns.

P. Wardle.

Carlisle, January 30th, 1915.

The letter to you of the 8th inst., by "Ex-Gas," in reference to the above, and Mr. Stretton's reply in your issue of the 22nd inst., have been brought to my attention.

The effect of low frequency in causing of jectionable fluctuations or flicker on tungster-filament lamps has received a great deal of investigation, and a number of papers have been presented on this american engineering societies, Mr. John W. Howell, in a paper before the Institute of Electrical Engineers, at New York City, put

the practical point of the matter very clearly as follows:—

"The variation of light from a filament due to the variation in current caused by the successive impulses of an alternating current depends upon the heat capacity of the filament, the heat radiating characteristic and the resistance characteristic. Tungsten has a specific gravity about 10 times that of carbon and a specific heat one-fifth as great, so the heat capacity of a tungsten filament is about twice that of a carbon filament of the same dimensions. The heat radiating characteristic of tungsten is better than that of carbon because at a given temperature it radiates heat less rapidly than does carbon.

The resistance characteristic of tungsten is also more favourable than that of carbon for the retention of energy and heat as the current wave recedes. All these physical characteristics of tungsten are, therefore, better than those of carbon in respect to the retention of heat, and they all tend to make the flicker of tungsten lamps less than that of carbon lamps of the same size

filament.
"The actual diameters of tungsten filaments, however, are much "The actual diameters or tungsten maments, nowever, are much smaller than those of carbon filaments of the same candle-power lamps, and this more than effects the advantages of the other characteristics, for the flickering of tungsten lamps is greater than that of carbon lamps of the same candle power, while it is much less for lamps with the same size filaments."

The matter practically the question of flicker does not

Taking the matter practically, the question of flicker does not depend on the frequency on the lamp alone, but is very greatly influenced by the area and brightness of the illuminated surface within the field of vision.

As a general rule, M. zda lamps on 25-cycle circuits under ordinary conditions have been satisfactory in respect to flicker. Objectionable flicker increases as the wattage or size of the lamp decreases and the area of light service in the field of vision increases.

A 40 watt lamp, for example, in the centre of a room might show no objectionable flicker on 25 cycles, but the same lamp moved close to a light-soloured wall or ceiling is apt to result in an objectionable flicker effect. The tendency to objectionable

flicker under any condition decreases very rapidly as the frequency is increased above the value of 25 cycles, so that on 40 cycles the liability of flicker being noticeable is much reduced. In general, it is desirable to avoid using frequencies as low as 25 cycles for general lighting work. F. W. Willcox.

London, E.C., January 25th, 1915.

The Capture of German Foreign Trade.

I hope you will pardon me if I say that your efforts to impress on British electrical traders the importance of getting busy have caused me great amusement.

caused me great amusement.

After some 25 years' Colonial experience of the British trader, the idea of his "capturing" a customer off his own bat is quite beyond belief. The patriotism of the Colonial may cause him to capture the trader, and so leave the latter to flatter himself that "alone he did it," but most decidedly, if precedent goes for anything, the position will not be reversed.

The British trader (electrical and otherwise) suffers from a number of more or less inherited disadvantages. One is his ingrained sense of superiority to the Colonial engineer. Another is his ignorance of what constitutes the British Empire, and the

ingrained sense of superiority to the Colonial engineer. Another is his ignorance of what constitutes the British Empire, and the geography of the same. A third is a bland diregard of instructions, and of his customers' wishes generally. I have met many specimens of the British trader during his travels, or mine, and have to admit that he is usually a very fine fellow when once he has got over his surprise at finding that Colonial akins are the same hue as his own; that they speak English without the twang he has read so much about; that they have quite important electrical engineering projects completed or building; and that their knowledge of their profession is not necessarily a minus quantity. Once he has shed the above layers of insulation, he frequently becomes quite human, and even learns to conceal his superiority. superiority.

I have mentioned the British trader's ignorance of Colonial recography, which sometimes makes me wonder if maps are published in the British Isles. Here is an instance:—I had occasion recently to write from Dunedin, New Z sland, to a certain advertiser in your paper about his manufactures. He replied stating that Mr. So-and-So, of Geelong, had his agency in Australia, and suggested that I might drop in and see him. As Geelong is about 1400 miles from Dunedin and in a mall and are here. and suggested that I might drop in and see him. As Geelong is about 1,400 miles from Dunedir, and is a mall and rather insignificant inland town in Victoria, with a very wet ocean intervening, I had to decline the invitation, and business did not result.

For quite a long time before war broke out I suspected that the British trader was mostly a German. My surmises seem to have been confirmed by the lists I have read in your columns of Germans trading under British names. There were two reasons for my suspicion. One was the unusual consideration given to our orders for material; the other the frequent difficulty in securing sworn declarations that the material was made in England. (These declarations are necessary in order to secure preferential tariff rates.) It is, however, only fair to admit that the neglect to sign declarations is not clear proof of the alien nature of the rader because the generic Pairth to deep relder return to trader, because the genuine British trader seldom remembers to sign them either until the invoice has been returned to him for that purpose, and a cash deposit paid to the Cu-toms Department at

purpose, and a cash deposit paid to the Cu-toms Department at this end, in addition to the general inconvenience experienced.

Recently I tent a fairly large order for some material to one of your really British firms, and instructed them to be very careful to send a small portion of the material per post, otherwise an important contract would be delayed a month. Of course he packed this essential portion, which weighed about 3 lb., with the rest of the goods, and my company will have to wait for over a month for some large payments, due to the non-completion of the contract, which could otherwise have been finished a few days after the arrival of the goods. I need scarcely say that your British trader did not forget to draw on us at sight for his payment—and rightly so. I only mention this last point, because it is ment—and rightly so. I only mention this last point, because it is about the only one that never is neglected.

about the only one that never is neglected.

Let me give you another instance of your British trader. Some time ago my company ordered several hundred pieces of marble from a well-known firm, and explained that it was for electrical purposes. It duly arrived very badly packed, and was put into use. The first piece erected was a small slab for carrying the fuses for a house-lighting j.b, and as soon as current (230 volts) was switched on, the main fuses blew right across the terminals. Examination showed a metallic vein joining them. We naturally thought this was a solitary example, but when half-a-d zen other slabs in succession caused inculation troubles we thought it time to examine the rest of the consignment. We then found that every examine the rest of the consignment. We then found that every piece without exception was full of metallic veins, and quite usepiece without exception was full of metallic veins, and quite useless for electrical purp 1848, and had to be scrapped. I wrote to the suppliers quite civilly, pointing out that we had ordered marble, and not samples of iron-ore, and that I thought they should replace the consignment sunt, and at the same time I ordered a further lot. By the return mail I received a most indignant letter, stating that what I averred was utterly impossible; that they supplied marble to all the largest switchboard makers in England and finally that unless we apploprised for our makers in England; and, finally, that unless we apologised for our libell us statements they appolutely declined to do further business

with us We get our marble from America now.

Once when I was a small boy tempation overcame me, and I swallowed a peppermint that I had promised to safeguard for my sister. To mark the occasion I was sentenced to write out 500 times: "An Englishman's word is his bond" It made quite an impression on me, but nothing to an experience I had last year with another of your enterprising British traders.

A certain problem required to be dealt with, and I sent full reticulars to London to a firm that professed to specialise in this particular direction. I stated that we had to give our customer an absolute "no-cure-no-pay" guarantee, and that whatever they recommended and quoted for would have to be guaranteed in turn. an absolute "no-cure-no-pay guarantee, and the water recommended and quoted for would have to be guaranteed in turn. They cabled out a quotation in due course. In order to be on the safe side I cabled back asking if they guaranteed the plant, and they replied that they did. To make a long story short, the plant sent was quite inadequate, and we had to spend a large sum of money besides losing all our profit, before fulfilling our guarantee. All this took over a year, and at various times I wrote your British trader (one of the sample British traders who is going to capture the German trade), and received various suggestions, all involving expense, which were carried out. Finally the contract was completed, and I then suggested that as we had entered into the contract in the first place entirely on this British trader's guarantee, he should at least reimburse us for our actual cash-out-of-pocket. I have lately received his refusal, but this time have handed the matter to our solicitors, and I hope you may yet read the details I have omitted—in your journal. "An may yet read the details I have omitted—in your journal. Englishman's word is his bond "!

Contrast this with the treatment we received from an American firm. We required a certain piece of apparatus for operating on a 230-volt circuit. Unfortunately it arrived wound for 110 volts, and we were put to an expense of about £100 fixing the difficulty up. We reported this to the American maker, and by return received a full apology and a draft for the amount. I have had this sort of treatment several times from American firms.

All the instances given above occurred before the war. Now let me tell you how the British trader proceeded to capture Colonial let me tell you how the British trader proceeded to capture Colonial business from the foreigner as soon as war broke out. It happened that my company had sent orders to England for several thousand pounds' worth of material of all kinds, and most of these orders were actually in hand at the time hostilities commenced. We were notified immediately that orders could not be filled, and where stocks were actually available prices were raised to an exprision theorem of the most officer of the stocks were set as the prices were raised to an expression of the stocks were supplied available prices were raised to an expression of the stocks were supplied as even doubled—although they had not cost one single penny more to make, up to then. It was simply a case where supplies were short, and the British trader saw a chance to make a large unearned profit on what he had. Of course I quite recognise that since the war started many articles which depended on Germany for raw material must increase in which depended on Germany for raw material must increase in price. My remarks are confined to material made before the war

In New Zealand we have a Customs tariff that gives the British trader a considerable advantage over the effete foreigner. In my opinion it is a mistake, and simply tends to make the British trader lazy. If we trebled the preferential Customs duty, he would just raise his price in proportion, and pocket the extra profit.

I have stated that the British trader does not show consideration

for his customers' wishes. I will offer one final example—an experience of a friend of mine. My friend wanted certain articles that are supplied in small wooden cases of somewhat flimay nature. He has a special use for these cases afterwards, but usually finds that it is impossible to get the nails out without spoiling them. A few months back he was called upon by a British trader and a Garman. He asked whether these cases could not be supplied with screwed lids. The Britisher said that it would upset the routine of the works, and declined. The German agreed without any demur at all. The order went to Germany.

No doubt it will be objected that I have exaggerated, and shown

prejudice in the instances that I have given you of bungling, &c, I can only assure you that my statements are strictly correct. My experience in business has been confined to British and Americans, and I have constantly declined to knowingly do business with Germans for years past, although a much greater profit could often have been made thereby. I have occasionally had German goods landed on me, but that was not my fault, but due to the fact that the British electrical trader appears to have been mostly a German.

the British electrical trader appears to have been mostly a German.

The British trader is one everlasting source of exasperation. The American is courteous and considerate, and makes beautiful stuff, in spite of the British belief to the contrary.

If the British trader wants to capture the trade that has hitherto gone to foreign countries, he will have to mend his ways. Holding meetings, passing resolutions, writing to the papers, waiting for business to come to him instead of going after it; wearing a "superior" air; posting catalogues without mentioning the trade discounts; ignoring customers' reasonable (or sometimes even unreasonable) wishes; none of these will do it. When this war is over, Germany will have huge factories simply yelling for work at any price, and on any condition. Then will be the time the British trader will feel the pinch. Let him get busy capturing friends in the meantime. Here is one very willing victim. But I can't picture him doing it.

Galvo.

New Zealand, December 18th, 1914.

Salaries of Junior Engineers.

I do not think much of "Mr. Experienced's" knowledge of central station practice as exemplified by his ideas of the duties of a shift engineer.

Routine has, of course, some bearing on the matter, but very title. How about coal, oil and water testing; arrangements of labour owing to the absence of an individual; efficiency tests; hourly reading of thermometers for circulation water, flue, boiler, atmospheric, economiser and feed temperatures; observing that the vacuum is maintained at the highest possible and continual testing if vacuum is low; readings for atmospheric humidity; maintenance of CO_2 apparatus and proper distribution of fire in grates; observing ammeters and when and where to "split" in case of trouble; getting a feeder on to hospital bus-bars, in case of breakdown, in the minimum of time with the maximum

Add to this examination and recording of defects in plant, and statistics regarding coal, water and oil used per B.T.U., and it will be seen that there is not much chance either to play cards with the switchman or chat with the driver, and if one did so either all control or organising power would be lost at once, as well as all self-respect. I enclose my card.

Three to Eleven.

The letter appearing in your issue of January 22nd, signed "Experienced," should undoubtedly be treated with contempt rather than discussion, but the inference drawn from it makes it conclusive that "Experienced" knows very little of his subject. Although this will be apparent to the engineer reader, the ELECTRICAL REVIEW, having a wide circulation, is read, among others, by members of municipal electricity committees.

Often these gentlemen, although successful business men, are not acquainted with the various duties and responsibilities, and the conditions under which the staffs of some of these undertakings

conditions under which the staffs of some of these undertakings work, consequently, "Experienced's" letter needs elucidating. For the benefit of these gentlemen, I would point out that the trained shift engineer, with or without college education, does not work by "Rale of thumb," neither is he the frivolous person depicted. He is mostly over the age of 25, and obtains his appointment in open competition. As regard 25, and obtains his appointment in open competition. As regards the running of stations by automatic machinery, the introduction of mechanical stokers undoubtedly enables one fireman to work more boilers, yet the possibility of creating smoke and wasting fuel by the unskilled fireman is as great as ever.

as ever.

Automatic voltage regulators merely dispense with volt boys. Regarding the statement that the real work is upon the station superintendent and his assistants, I should like to know who are his assistants if it is not the shift engineers? Often the superintendent's day is mapped out. He starts at 9 a.m., goes to dinner at 1 p.m., and finishes his day at 5 p.m., and has half-day Saturday and all day Sanday clear. A large portion of his time is occupied in making up works costs and fagging for the assistant engineer. During the most important times of the day these gentlemen are away; then the entire responsibility rests upon the shift engineer. As for the "good steady drivers," their duties consist of starting, stopping and oiling engines. This only occupies a fraction of their time, the rest of which is mostly spant in sitting down, reading and smoking.

The shift engineer's position is mostly one of responsibility with-

The shift engineer's position is mostly one of responsibility without power, and he is for ever between the sandbanks and the deep He is often blamed for the act of a mulish fireman, or absent-minded driver, or even a fluctuation of pressure due to the fault of a badly-balanced network. The chief, being a busy man, cannot come into contact often with the shift engineers, whose reputation therefore is dependent to a great degree upon those above him, and it is often woe betide the shift engineer who exoites their professional jealousy. From a perusal of past correspondence in the Electrical Press generally, the writer is of opinion that relationship, and political and social ties, often loom more prominently in promotion than abilities in some municipal undertakings.

In concluding, I would say to "Experienced" that we shift engineers do not work seven days a week and all holidays, only obtaining time off by working for each other, for fun. I contend that we have much more right to vent our grievance than many an ignorant driver, who knows nothing of the law of Oum, properties of steam, comb lation of fuel, or even the construction of his

own engine, whose sole ambition is to spot a winner and who has never spent a copper on a technical journal in his life.

Mr. Eben's letter, in my opinion, is far too gentlemanly for a Hyde Park oration, and so are the methods of the Association of Electrical Station Engineers. Let us fellow-shiftmen, where we are asked to give our services for a few pence more, or, perhaps, less, than the engine driver or fireman, join one of the great Unions of skilled workers, for it is apparent that only by doing so shall we obtain our enancipation from being

Slaves of the Lamp.

The following is an extract from a letter I have recently received Ine following is an extract from a letter I have recently received from a member of the A.E.S.E., which is typical of many others:

—"Regarding my subscription, I am so thoroughly disgusted with the 'profession' that I am taking up a clerk's position in a short time and then will not be eligible for membership. After struggling for years on a pittance, I managed to pass the A.M.I.E.E. examination, and still can only earn 35s, per week."

The obvious deduction from this is that the organization and still can only earn 35s.

The obvious deduction from this is that the engineer managers of electric supply authorities fail to recognise the examination of the Institution of Electrical Engineers which we have been told should be the sine qua non of an electrical engineer. The majority of the engineer managers are members of the IEE; one would almost believe that they had no confidence in their own Institution.

I will say no more at the present critical period of the nation's history, but will leave the foregoing to the conscience of the Institution of Electrical Engineers and that of the engineer managers.

W. J. Ebben,

Hon. Gen. Secretary, AE.S.E.

London. N.E , February 2nd, 1915.

Wonderful Accumulator Cells.

Having read "A. W. B.'s" alleged reply to my letter, in which sulphate is as conspicuous by its absente as it is in my test cell, I sulphate is as conspicuous by its absence as it is in my test cell, I may presume that my claim is not, disputed. To close this rapidly diverging correspondence I offer a four-cell battery made up with celluloid, wood, ebonite and the "wonderful" separators, which, with the exception of the last, will be found, when totally discharged, to sulphate in the order as printed. I decline to be drawn into criticising any matters not appertaining to "A. W. B.'s" original letter.

A. Faraday Hawdon.

Newcastle-on-Tyne, January 25th, 1915.

["A.W.B.'s" letter was abbreviated by ourselves; it did contain references to sulphate, but as they appeared to be somewhat oryptic, if not incoherent, they were omitted.—Eds Elec. Bay.]

NEW ELECTRICAL DEVICES, FITTINGS AND PLANT.

New Direct-current Motors.

The BRITISH THOMSON-HOUSTON Co., LTD., of Rugby, have introduced a new type of direct-current motor, known as the D.R., in which is incorporated the firm's very extensive experience in this class of work. Commutating poles have been incorporated in the design, giving a wider speed range with field control, and practically sparkless commutation.

The magnetic structure is expected to produce the magnetic structure is expected.

The magnetic structure is arranged to render the motors free from objectionable hum, and ventilation is secured by means of a substantially-designed fan mounted at the back of the armature, the air being drawn through radial ducts in the armature core.

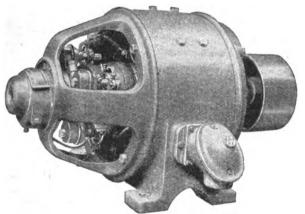

FIG. 1.-NEW TYPE B.T.H. MOTOR.

The commutators are also provided with ventilating ducts. The armature coils are vacuum dried and treated with special moisture

and acid proof compound.

All D.R. motors have an overload capacity of 25 per cent. for 30 minutes, and will withstand a momentary overload of 100 per cent. without injurious sparking or heating, whilst all protected

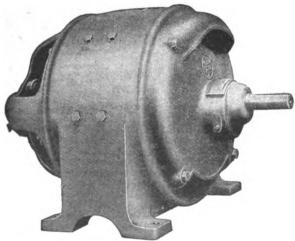

FIG. 2.—B.T.H. MOTOR SHOWING HOODED END SHIELD.

enclosed ventilated, drip proof and pips ventilated type motors will operate for six hours wi h a maximum temperature rise (measured by thermometer) of 40° C.

The motors can be readily converted into protected, enclosed ventilated or drip proof types by the substitution or removal of covers, while to convert into pipe ventilated, or totally enclosed (water or gas-tight) types, it is only necessary to substitute one or both end shields respectively.

The bearings are carried on the end shields, and the latter can be turned through 90° or 180° to facilitate mounting the motor on the wall or ceiling.

The standard muchines are either shunt or compound wound, but series wound motors can be supplied when required, also baseplates for motor generator sets.

A Series Lighting System.

With the advent of high amperage Maz la hilf-watt lamps, a large number of existing arc lamps are being replaced, especially for street lighting and similar purposes. It cases where lamps can be arranged to run in short series and where the temporary can be arranged to run in short series and where the temporary failure of the series through the breakdown of one of the lamps would not be serious, no special apparatus is required. Where lamps, however, are required to operate in long series, it is necessary to provide suitable apparatus to prevent the sudden extinction of a large number of lamps. The B.T.H. street lighting system provides the following alternatives:—

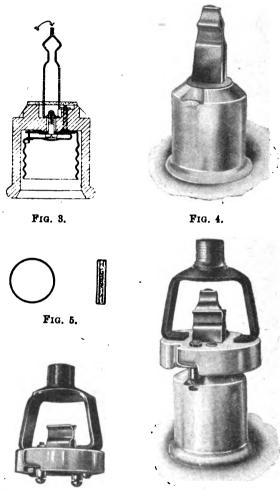

(a) Substitutional resistance with automatic cut-out for each

lamp.

(b) Automatic constant-current transformer for each circuit

(c) Automatic film out-out only for each lamp.

System (a) is expensive where a large number of lamps have to be equipped, and where expense is a barrier, system (b) is recommended.

F1G. 6. Fig. 7. AUTOMATIC FILM CUT-OUT FOR HALF-WATT LAMP.

In system (o) a short-circuiting cut-out to each lamp is satis factory on ordinary circuits, providing that not less than 10 lamps are in the series, or where apparatus can be provided at the central station for plugging in an additional lamp where the ammeter shows that one of the lamps of the series has failed.

The automatic film cut-out referred to above in systems (b) and

The automatic film cut-out referred to above in systems (b) and (c) is a most interesting accessory, which we have pleasure in describing and illustrating in this article. The disk (fig. 5) consists of two aluminium plates insulated from each other by a piece of chiff in veiling and held together by varnish. These disks will readily break down between 150 and 200 volts, and are placed between the prongs of the holder in the position shown in figs. 3 and 4. Fig. 6 shows the receptacle with the connecting clips. The holder is inserted into this receptacle as shown in fig 7, and can be inserted or removed from the line of circuit without danger from, or interrnation to same. The spring contact of the holder upon or interruption to, same. The spring contact of the holder upon removal of the lamp makes contact with the outer shell and com-pletes the circuit, thus enabling a new cut-out to be fixed without

puncturing same on replacement.

This interesting device is one of many articles described in price list Nc. ML 10,480, of the BRITISH THOMSON-HOUSTON Co., LTD., Mazla House, 77, Upper Thames Street, E.C. This price list shows a variety of waterproof lanterns, street lighting fittings, ironclad ship and mill fittings, & x., for Mazla lamps of all types.

Electric Hand-Grinding Machine.

The electric hand-grinding machine, illustrated in fig 8, has been designed with a view to obtaining the most practical arrangement of the hand grips, so that the weight of the motor is taken equally on the two hands, whilst at the same time this arrangement permits of the use of the grinding wheel in the most representations. The machines are made for direct situations.

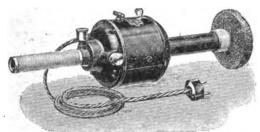

FIG. 8.—ELECTRIC HAND GRINDING MACHINE.

current or for three-phase, the direct-current machine having a H.P. motor and the three-phase machine a # H.P. motor. Both 4.H.P. motor and the three-phase machine a 4 H.P. motor. Both are suitable for use with emery wheels up to 4-in. diameter by 4-in. wide. As the machines can be supplied for all ordinary voltages, and are very inexp neive, they are finding some considerable favour in works and in foundries where they are primarily used for finishing off rough castings, and so avoiding much of the labour of chipping and rough filing. The motors are provided with special ball bearings so as to obtain the lightest possible running, and the switch is very conveniently placed on the top of the motor.

Further particulars can be obtained from Masses. Moreis and Lister (London), Ltd., 3, Palace Chambers, Bridge Street, Westminster, or Messes. Deake & Gorham, Ltd., 1, Felix Street, Westminster.

Westminster.

Paragon Earthing Cone.

The Paragon patent earthing cone, which has been introduced by MESSRS. SCHOLEY & Co., LTD., of 56, Victoria Street, S.W., has been widely used abroad. As shown in fig. 9, it consists of a substantially constructed hollow cone made of pure copper, suitably perforated, and filled with small charcoal or coke. Running down through the cone and securely soldered to the copper tip at the bottom is a braided hollow copper cable, into which the earth

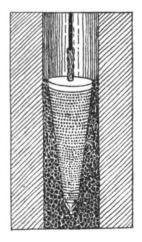

FIG. 9.—PARAGON EARTHING CONE, AS INSTALLED.

wire is sildered. On the top of the cone is placed a copper cap. The dimensions of the cone vary from 1 to 2 ft. in length, and as the width at most is only a few inches it is readily installed at a small cost, a small hole being bored in the ground, and the cone being then surrounded with a mixture of coke and moist earth.

Beuttell Fittings.

MESSES. A. W. BEUTTELL, LTD, have sent us particulars of a number of new patent fittings which they have designed for use with the tubular lamp for shop windows, cornice lighting, & J. The

FIG. 10.-MOULDING STRIP WITH METAL REFLECTOR AND COBRUGATED GLASS SCREEN.

cesential feature of the Bauttell system is the use of a rectilinear essential rearure of the Bautiell system 1s the use of a rictilinear filament as the source of light, which can, of course, be accurately placed at the focus of a suitable reflector—more accurately than a bulb lamp, or any other electric light, except the arc. The focus of a bowl-shaped reflector is necessarily a mathematical point, whereas that of a cylindrical reflector is a line, with which the district can be made to coincide; thus the orbital reflector is a refiscor, and a high degree of concentration of light can be

obtained. In recent patterns the reflecting surface, when of silvered glass, has been given a corrugated shape, the corrugations being of defined depth and contour, and disposed

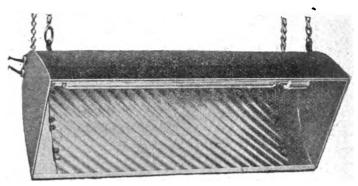

FIG. 11.-FITTING FOR SHALLOW SHOP WINDOW,

obliquely to the line light source, to prevent the production of streaks; when a plain reflecting surface is used, a corrugated glass screen is interposed in the path of the light rays. The maximum candle-power can be raised to more than five

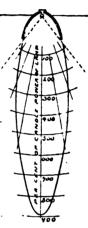

FIG. 12.—POLAR CURVE.

times the rated CP of the lamp. Besides the well-known strip form of fitting, in various patterns, portable fittings for lighting showcases are now made, wood mending strip (6g. 10) fittings for shop-windows such as that illustrated in fig. 11, theatre footlights, &c. Fig. 12 shows the polar distribution curve for the fitting illustrated in fig. 11.

The fittings are sold by Messrs Siemens Bros., the Elison and Swan Co, and the L nolite Cc., Ltd.

New Ladder.

MR. J. H. HEATHMAN, of Parson's Green, Fulham, S.W., has devised an improved patent ladder which can be put to a variety of uses. As shown in fig 13, it consists of a set of three light but strong ladders, which can be used separately or together; two of the lad lers can also be fastened tog ther as a self-supporting treatle,

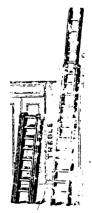

FIG. 13.—HEATHMAN "TREBLE" LADDERS.

and the third ladder can sgain be attached to these to give additional elevation, after the fashion of a very tall "stepladder.'

Immersion Heater.

A neat device made by the ELECTROCALOR S.A., of Geneva, Switzirland, his recently been introduced to the English market; it consists of a pair of concentric carbon electrodes enclosed in a per-

forated earthenware sheath, and connected with a flexible cord and

forated earthenware sheath, and connected with a flexible cord and plug for attachment to a lampholder.

The circuit is entirely open until the heater (which is called the Thermo Fox) is inserted into a liquid which completes the circuit, and the voltage of the circuit is immaterial. Obviously, in brine or other well-conducting electrolytes the current would be excessive, and therefore, except when water or coffee is to be heated, the heater is enclosed in a nickel-plated jacket filled with water, which prevents the access of the curer solution or liquid to the electrodes. A rubber tube protects the fixible where it is connected to the heater.

The device por es several novel features, and if used with reasonable care should prove very useful for a variety of purposes it should be used only on A.C. circuits. The sole agency for this country is in the hands of Mr. E. Meyer, of 62 Grosvenor Road, Highbury, N.

LEGAL.

EYDMANN v. THE PREMIER ACCUMULATOR Co., LTD.

THIS case came before the Court of Appeal, composed of the Master of the Bolls and Lord Justices Swinfen Eady and Phillimore, upon the sppeal of the company (the employers) from the award of the Northampton County Court Judge in a claim made against the company under the Workmen's Compensation Acts by Mrs. Mabel Evelyn Eydmann and her infant children, as the widow and children of Harold Joseph Eydmann, a workman employed by the

company.
While packing up lead-lined boxes at the Northampton borough generating station on April 7th last year, through one of the boxes slipping, Eydmann cut his thumb by a projecting piece of lead and septic poisoning set in, with the result that he died on May 31st. The County Court Judge awarded the applicants compensation. The ground of the present appeal was that the proper statutory notice of the accident had not been given, and that the appellants were

prejudiced thereby.

At the conclusion of the arguments of counsel, their Lordships allowed the appeal, holding that the employers had not received proper notice of the accident, and that the applicants had not discharged the onus of proving that the employers were not pre-judiced by the want of notice.

ELLIS r. FARADAY & SONS.

In the King's Bench Division, on Monday, February 1st, before In the King's Bench Division, on Monday, February 1st, before Mr. Justice Bailhache and a common jury, an action was brought against defendants, electrical engineers of Wardour Street, W., by Mrs. Maria Ellis, aged 72 years, to recover damages for alleged personal injuries sustained by the negligence of the defendants' servants. The defendants denied liability. The case for the plaintiff was that in January, 1914, she was knocked down by a box tricycle belonging to the defendants and was seriously injured, one of her legs being broken in two places. She was treated at the Middlesex Haspital, and subsequently through the injury to her leg she fell down and broke her right arm. She claimed to recover damages and £65 special expenditure incurred.

Mr. Harold Faraday said that it was suggested to him that £20 should be paid to settle. No agreement was arrived at, and

£20 should be paid to settle. No agreement was arrived at, and the matter passed into the hands of the solicitors. The jary awarded plaint: £100 damages. Judgment was entered

accordingly.

HAMILTON r. MARCONI'S TELEGRAPH Co., LTD.

THIS pending action was mentioned to the Lord Chief Justice in This pending action was mentioned to the Lord Chief Justice in the King's Bench Division and the hearing fixed for February 9 h. Mc. Duke, K.C., said he appeared for the defendants and Sir Elward Carson, K.C., was for the plaintiff and the application was that the case should be fixed for hearing on February 9th.

His Lordship inquired the reason, and was told that if the day was not fixed it might necessitate one counsel giving up his brief, which was undes able now that the briefs had been read. His Lordship said the case would be in the list for hearing on F bruary 9th.

F.bruary 9.h.

Underwood v. British Ubalite Co., Ltd.

In the City of London Court on January 28th, before his Honour Judge Rentoul, K.C., and a jury, an action was heard in which Mr. A. L. Underwood made a claim against the British Uralite Cc., 1903, Ltd., to recover £90 as damages for breach of contract about the purchase of a Bruce Pebles generating set, comprising an engine and dynamo, then at Gravesend.

Mr. C. Doughty and M. Maca-kie appeared for the plaintiff, and Mr. Morton Smith for the defendants.

MR. DOUGHTY explained that the plaintiff was a machinery broker and dealer in the City of London, who did a large business in buying machinery and selling it again. The claim raised an important question with regard to the principles on which machinery brokers and dealers dealing in electrical machinery, &did their husiness. There had been equared dealings between the did their business. There had been several dealings between the plaintiff and defendants. Defendants were in a large way of business, and at Gravesend they had large works. From time to time, no doubt owing to the various processes which the defendant

company were interested in, parts of their machinery became out of date, or they desired to replace them with machinery of more modern type. When that occurred plaintiff had seen them and had found for them purchasers of that machinery. In those had found for them purchasers of that machinery. In those dealings it was the custom of the trade for the broker always to buy himself, and himself to sell to his own purchasers. He was not in any sense the real purchaser, in that he did not buy to keep. He always bought to sell, and, as a rule, he did not buy until he had sold on to somebody else. Plaintiff obtained particulars, photos and plans of the particular machinery which it was desired to sell. He then advertised it as if it were his own in all the ordinary trade papers, and being in that line of business all his life he knew through the knowledge he had acquired just where he could place the particular bit of machinery, whereas people like the defendants who might know their own business very well might have machinery on their hands for years because they did not know where to find a market for the machinery which they desired to sell. Plaintiff having found a purchaser then purchased from the defendants. There were occasions if the price was from the defendants. There were occasions if the price was sufficiently tempting, when the plaintiff would himself buy the machinery as a speculation, hoping to find a purchaser afterwards. If he did that the price would have to be very low because there was a risk of putting down a considerable sum of money for heavy machinery, for which one had not an immediate purchaser on the market. The almost invariable custom was to find the purchaser first. That was to the advantage of the seller. If a broker was going to buy as a speculation he did so at a breakdown price. If going to buy as a speculation he did so at a breakdown price. If he had a customer ready he bought at a price which would show a profit. In Outober defendants had a generating set for generating electricity for sale, and they got into communication with the plaintiff about it. His manager went to Gravesend to take particulars. It was a steam engine and dynamo that was for sale, also other electrical accessories. Plaintiff thought he could place the machinery if he could get an option on it. Defendants gave him an option for a week for the set at £250, thus undertaking not to sall it to anyone also for that time. Then plaintiff advernot to sell it to anyone elee for that time. Then plaintiff adver ti ed it in those channels with which he was very familiar, and sent circulars round describing it. He came into communication in that way with Mr. Martin, a machinery broker in Birmingham, who knew who wanted the set. Correspondence passed between plaintiff and Martin, who knew one another very well. Martin brought to Lindon Mr. Robinson, who was an engineer. Martin and Ribinson went to the defendants to see the machine. Plaintiff's option had been renewed. On November 4th the buyer was ready to make a deal. The option for £250 was renewed till November 4th. It was arranged that the plaintiff should, at his own expense, go to Gravesat with the proposed buyer, and he dismantled the machine so that it might be properly examined. Plaintiff's men took down the cylinders and stripped it. It was satisfactory, and Ribinson told the plaintiff the deal was as good as complete, but he must see his directors. Martin was going to pay £325 to the plaintiff, and Martin was to make a small commission of £30 from the buyers, whom he had disclosed to the plaintiff. There was no definite contract between the plaintiff and Ribinson before November 4th, accept the offer to buy at £250, because it was not necessary according to the views of all machinery brokers in Lindon. He was confident that the set was as good as sold. Ribinson was the in that way with Mr. Martin, a machinery broker in Birmingham, according to the views of all machinery brokers in London. He was confident that the set was as good as sold. Robinson was the engineer to Kynochs, of Birmingham, and he had been sent by them to look at the machine, although it was wanted by the Kynoch Town, near to Gravesend, the manager of which telephoned on November 13th to the defendants in perfect good faith, and said he wanted to speak to them about a generating set which their engineer had inspected. He agreed to buy the set from the defendants at £310, without even looking at it. Defendants accepted it, and the sale took place. Praintiff was not complaining of Kynochs. Defendants knew perfectly well what they were doing, and made no communication to anyone. A director of Kynochs agreed to buy the set and wrote to Martin offering £350. Kynochs agreed to buy the set, and wrote to Martin offering £350.

Martin t-lephoned to the plaintiff to say he would buy the set introduced by him. Then the defendants curtly said the set had been sold, and they would not say who were the purchasers. Plaintiff found out that it was Kynochs. Martin began to think that the plaintiff had "sold" him but that was not so. Plaintiff now claimed his profit as the defendants' b haviour was contrary to all good business dealing and contrary to law.

MR. UNDERWOOD, the plaintiff, was called, and he said there

machinery, as defendant did, not to go behind the broker's back and effect a sale, thus saving his commission or profit.

Mr. W. W. Martin, having been called, saying there was a very strict custom that the vendor was not to deal with the purchaser

direct,
MR M. J. PALEY, engineer, Kynoch Town, Stanford-le-Hope, supported the plaintiff's case, as did also MR. A. G. Brown, of W. & E. Moore, Ltd., Poplar.

For the defence, Mr. KNIGHT, manager to the defendants, said For the defence, Mr. KNIGHT, manager to the defendants, said that the plaintiff had only had one previous transaction with them. The custom deposed to by the plaintiff did not exist. They had done nothing to cause the first sale to go off, nor to sell the machinery direct to Kynochs. They had no knowledge who the plaintiff took to Gravesend in the first place, and therefore there was no reason why they should not deal with Kynochs when they came along. Had plaintiff come to them in a proper manner and asked them to meet him they would have done so. They had not gone behind the plaintiff's back, or done anything dishonourable.

Judge Rentoll K.C. summed up and the jury found for the

JUDGE RENTOUL, K.C., summed up, and the jury found for the plaintiff for £71. Judgment was entered accordingly, with costs.

A stay of execution was ordered with a view to the defendants

appealing, Mr. Morton Smith remarking that there was no justification for the verdict, having regard to the evidence which had been given.

GUIMACHER e. LEVY BROS. & Co.

In the City of London Court, on Tuesday, Mr. Edward J. Gat-macher, sales agent for Eastman Electric Machine Co., 1, Talbot Court, Gracechurch Street, sucd Messrs. Levy Bros. & Co., 13-17, Goswell Road, for £3 for wiring and fitting up an electric installation for an Eastman electric cloth-cutting machine which plaintiffs. sold to the defendants. He said he made an arrangement with the defendants that he should fit up the machine with electricity, and was done the same week. Defendants had sent him a guines, which he returned as the amount was wholly insufficient. He supplied the machine on trial, and as it was not approved of it was returned. Now he wanted to be paid for fixing the electric installation. The machine was to be fitted free if it was purchased, but it was not.

MR. F. BOUSTRED, defendants' solicitor, said that as plaintiff told defendants he would have to pay for the installation, they agreed to give him a guines towards the expenses, not because there was any liability upon them to do so. Plaint: ff denied that.

JUDGE ATHERLEY-JONES found for the plaintiff for 30s., and supposed the decision would not please either party.

ASUNCION TRAMWAY, LIGHT AND POWER Co., LTD.: BRAZIL RAILWAY Co. r. THE COMPANY AND OTHERS.

THIS debenture-holders' action came before Mr. Justice Sargant in the Chancery Division on Tuesday, February 2nd, on a motion for judgment, in default of defence, the plaintiffs seeking to enforce their debenture security. Mr. Bischoff, for the plaintiffs, said that there was originally opposition by one gentleman, who had put in a defence in which he did not admit the amount of the advances. a defence in which he did not admit the amount of the advances made by the plaintiffs. His Lordship: Some advances were, however, admitted? Mr. Bischoff said yes, and that gentleman now appeared by Mr. Luxmon and did not oppose an order in the terms of the proposed minutes. Mr. H. E. Weight, for the company, raised no opposition to an order being made, and his Lordship pronounced the usual debenture decree directing the usual accounts and inquiries.

MACDONALD v. L. & Y. RAILWAY Co.

At the Liverpool Assizes, on January 28th, Mrs. Jane Macdonald, of Waterloo, the wife of an officer on H.M.S. Carmania, of the Canard Line, was awarded £150 damages against the L. & Y. Bailway Co. in respect of injuries. The plaintiff branded an electric train at Bootle, thinking it was going to Waterloo, but the train went on the Aintree line, and, on pulling up at Ford Station, the plaintiff tried to alight. As she was doing so the train was suddenly started, and she was thrown on to the platform. The defence was that the plaintiff found herself in the wrong train, and made a rush to get out of the train when it was moving.

Jadgment was entered for the plaintiff for £150.

OUR LEGAL QUERY COLUMN.

"ELECTRIC" writes: "I shall be pleased if you could help me in

the following matter:

the following matter:—

"A tenant took a house from me for three years with gas light and asked if I would put electric light in the house. I could not run to this, but he then asked if I would allow him to put it in for his own benefit, this I agreed to. His time is up and he now threatens that unless I pay half the cost of wiring the house he will pull the wires out of the iron tubing.

"1. Please inform me if he can legally do this?

"2. If so, can I make him take away the tubing he has had plastered in the walls, and the switches, and make good with plaster and paper to match, and restore the gas as before, although the fittings were sold for old iron, & ...?"

* There can be no doubt that where a tenant makes any

* There can be no doubt that where a tenant makes any alterations in the leased premises, the landlord is entitled either to (a) call upon him to restore the premises to their original condition, (a) call upon him to restore the premises to their original condition, or (b) to annex any improvements made without paying the tenant any compensation therefor. In the present case there do not appear to have been any written terms of the letting. A tenant from year to year of a house is only bound to keep it wind and watertight, to use it in a tenant-like manner, and to make fair and tenantable repairs, such as putting in windows or doors that have been broken by him, so as to prevent waste and decay of the premises. He must not commit any waste, but he cannot be compelled to replace doors, windows or stairs worn out with age, or to re-roof the house, renew the main timbers, or execute other general or substantial repairs. Tenants for terms of years are, however, under more extensive obligations to repair, since it appears that they are liable for permissive waste, though tenants for life are not. "Electric" appears to have a tenant for a term of years, and had he put in electrical fittings without leave, he could be called upon to remove them. It is apprehended, however, that the fact of the landlord having given him leave to substitute electricity for gas will now make it difficult for the landlord to call upon him to take out the electric fittings and restore the gaspipes and the premises generally.

"PLUME" writes: "I am chairman of a Corporation Electricity Committee. For some years we have been supplying current for photographic printing at power rates. We have now a Local Government auditor. Our town clerk says it is illegal to supply current at power rates for photo-printing, as it is lighting, and not power, and that if we continue the L.G.B. auditor will surcharge us, on the grounds that we are giving preferential terms to one section of tradesmen using light.

"At the last Committee meeting I produced letters from the following Corporations, showing that they all supply current for photo prints at power rates:—Liverpool, Leeds, Manchester, Bradford, Bristol, Birmingham, &c. In answer to these letters the town clerk said it is certainly illegal, but these Corporations have not L.G.B. auditors, otherwise they would not charge at power rates.

"1. Is it illegal to supply current for photo-printing at power rates?

"2. If we supply at power rates, are we liable to be surcharged?
"3. Oan you quote any test cases bearing on the point?"

. As to (1) the problem suggested is one which has never been decided in a Court of Law. It is conceived, however, that although

decided in a Court of Law. It is conceived, however, that although the question is somewhat near the line, the u e of electricity for photo-printing is user for lighting, and not for power purposes. In being so used, it is applied to the doing of that which could be better done by ordinary sunlight, and which might be done by gaslight. Moreover, one of the arguments adduced in support of the economic policy of supplying for power at lower rates than for light, is that in the former case the consumer will generally want to be supplied during the day, when the generators might otherwise be idle. Light for photo-printing would, in the ordinary course, be supplied by the sun during the day.

As to (2). In effect, supply at power rates does confer a favour upon a certain class of consumer, and would contravene Sec. 19 of the Electric Lighting Act, 1882, which provides that: "Where a supply of electricity is provided in any part of an area for private purposes, then except in so far as is otherwise provided by the terms of the licence, order, or special Act authorising such supply, every company or person within that part of the area is entitled under similar circumstances to a corresponding supply." Of course it might be argued, in answer to the complaint of an ordinary consumer, that "Plume" was being favoured, that "Plume" was not getting or using electricity "under similar circumstances." But it is apprehended that the broad distinction is between the use of electricity as a means of producing "light," and as a means of transmitting power. As to (3).—See answer to No. 1.

WAR ITEMS.

An Open Letter to Germany.—An electrician writing on board one of His Majesty's ships in the North Sea says:—"Can you not put an open letter to the German Fleet in your next issue? Do they really know how eager we are for a pitched battle?"

French Government Contracts .- The Board of Trade desire to draw the attention of manufacturers, merchants and shippers to the following regulations governing the export of articles destined for the use of the French Govern-

1. Application for permission to export to France goods of which the export is prohibited by Proclamation will receive special consideration if it can be clearly shown that the goods are destined for the use directly or indirectly of the French Government. Such applications must be made to the Commission Internationale de Ravitaillement, India House, Kingsway, W.C.

2. Documents issued by provincial military or naval officers, other local authorities, or Government contractors in France will not be recognised as evidence of the destination

France will not be recognised as evidence of the destination of the goods unless formally approved in writing by the competent department of the French Government.

3. British manufacturers, merchants and shippers are accordingly warned that, before entering into any contracts for the supply of goods stated to be for the use of the French Government, they should first obtain from their clients written evidence that the approval of the Ministry of War, Ministry of Marine, or other department concerned has been obtained.

4. Application for permission to export the articles in

4. Application for permission to export the articles in question must then be made in writing to the Commission Internationale de Ravitaillement, accompanied by the necessary documentary evidence. The applicants should not proceed with the execution of the order until they have satisfied themselves that a permit to export will be granted.

Any firms accepting contracts without complying with the above regulations will do so at their own risk and with full knowledge that permission to export the goods which they

knowledge that permission to export the goods which they have contracted to supply may be refused.

Applications for permission to export goods which are ordered by firms or individuals in France for purely industrial purposes, and which are not destined for the use of the French Government, will continue to be made in the ordinary manner to the Commissioners of Customs and Excise, Customs House, E.C.

Mr. Alexander Siemens's Sympathies.—The "Times" publishes the following letter which was a few days ago addressed by him to the Royal Institution, of which he is secretary. It was read at the meeting of members held on Monday last:

Caxton House, Westminster, London, S.W.,

February 1st.
It has come to my knowledge that a short declaration on my part, with regard to my position as a British subject, and with regard to my sentiments about the war, would be acceptable to the managers of the Royal Institution. I, therefore, venture to lay before you the following state-

I have been born in Hanover, both my parents having been British subjects until Hanover was separated from the United Kingdom in accordance with the provisions of the

Salie Law.

In the year 1866 the kingdom of Hanover was annexed by Prussia, and thereby universal military service was introduced.

In July, 1867, I first came to England, and I went back to Germany in 1868 to absolve my military duties, but I was not accepted on account of my shortsightedness. I had, however, to present myself again, when the war against France broke out in July, 1870, and I joined a regiment of the Line for a treatment.

the Line for one year.

In October, 1871, I returned to London, where I have resided ever since.

As it became probable that I should spend my life in this

As it became probable that I should spend my life in this country, I resolved to follow the example of the late Sir William Siemens by becoming a naturalized British subject. To carry out this plan I obtained my formal release from German citizenship in March, 1878, and my certificate of naturalization (No. 2,671) was filed at the Home Office on August 16th, 1878.

Thus I have been a subject of the kingdom of Hanover for 19 years, of Prussia for 12 years, most of which time I spent in Germany, and of the United Kingdom for over 36 years, nearly all of which I spent in London.

years, nearly all of which I spent in London.

As a consequence my sympathies in this war are entirely on the side of the Allies, and I cannot express strongly enough my abhorrence of the way in which Germany has disregarded international treaties and conventions, as to the conduct of hostilities, and more particularly of the raids made on unfortified watering-places in this country.

I should like to add that in return for the advantages I have enjoyed as a British subject, I have done my best to serve this country whenever an opportunity for doing so presented itself to me.

sented itself to me. ALEX. SIEMENS.

The above statement by Mr. Siemens may be described as The above statement by Mr. Stemens may be described as characteristically conscientious. It entirely confirms the opinion that we ourselves and a host of other admirers had formed of the writer during his 36 years' residence in this country in intimate and eminent connection with British electrical and engineering affairs.

country in intimate and eminent connection with British electrical and engineering affairs.

German Engineers and their Prospects.—The official journal of the Association of German Engineers and Technicists, in a retrospect of the year 1914, reviews the effects of the war upon the prospects of German trained engineers and technical men. The review is written in a somewhat chastened style, contrasting agreeably with the We-are-the-Victorious-Elect bombast of the German generals and professors. "We are unable," says the paper, "nor do we wish at the present time, to probe the causes of this bloody war. But we must take account of the facts of the present conflict, no matter what may be our individual convictions on the question of the war itself. It is certain that the wholesale destruction of life of the world-war cannot be reconciled with our ideas of humanity. Yet, no abandonment of the struggle now begun is possible which would endanger German civilisation and German economic life. The civilisation of our country must not be destroyed, nor its economic strength shattered. The future of all technical employés in particular is bound up with a result of the war that shall be favourable for Germany. If Germany at the mercy of our enemies, were broken up not only territorially but also economically, it is the men of our profession who would be the worst sufferers. An economically vigorous German industry is the necessary premise for the social advancement of our members,"—"Ironmonor,"

British Aluminium Employés,—In connection with the British Aluminium Employés,—In connection with the British Aluminium Co., Ltd., an illuminated roll of honour has been prepared, bearing the names, ranks, and regiments

British Aluminium Employés.—In connection with the British Aluminium Co., Ltd., an illuminated roll of honour has been prepared, bearing the names, ranks, and regiments of the employés who have enlisted, and surmounted by activation of the rally to the flag. From the factories at Kinlochleven, Fovers, Burntisland, Milton, Larne Harbour, and Warrington, and from the head office, the total enlistments are 462. The Scottish regiments have claimed many of the recruits, the Argyll and Sutherland Highlanders having the honour of the highest individual total of all (66). The fist includes the name of an officer in a French infantry regiment. The navy is also well represented. in a French infantry regiment. The navy is also well repreAccrington Electricity Employés.—The Chairman of Accrington Electricity Committee reports that several of the specially trained staff are desirous of joining the colours, in addition to those who have already done so. As their places would be extremely difficult to fill, he has sought the Council's opinion as to what course should be taken. The question is now under consideration.

Silvertown War Relief Fund.—The employés of the India Rubber, Gutta Percha and Telegraph Works Co., Ltd. have subscribed £537 13s. 3d. in the last 21 weeks to the National Relief Fund, British Red Cross Society, and Belgian Relief Fund, and we understand that they hope to continue to distribute £100 monthly between these three funds for as long as may be necessary.

Personal Mr. W. L. Leoning electrical anginery to the

Personal.—Mr. W. J. Leeming, electrical engineer to the Buxton U.D.C., who has joined the Forces, has been presented by the staff with a set of hair brushes in a leather case. During his absence his duties will be undertaken by Mr. Copland, M.I.E.E., at Mr. Leeming's present salary, less £2 per week payable to Mr. Leeming, and with permission to continue his consulting work.

The Buxelow Electricity Committee has decided that it can

mission to continue his consulting work.

The Burnley Electricity Committee has decided that it cannot see its way to consenting to the enlistment of Mr. Starkie (electrical engineer), Mr. Taylor (assistant engineer), and Mr. G. D. Clegg (switchboard attendant).

Temporary Lieut. L. B. Hogarth, of the 11th Border Regiment, who, as announced in the "London Gazette," has been gazetted Temporary Captain, was, prior to the outbreak of war, electrical engineer at Whitehaven, having previously exempted the position of borough electrical engineer at Moreoccupied the position of borough electrical engineer at More-

occupied the position of accupied the position of accupied the Military Wing of the Royal Flying Corps.

Mr. W. E. Jewell, electrical assistant to Mr. C. Jones, electrical engineer to the Metropolitan Railway, has joined His Majesty's Forces as Captain (Pioneer) in the 16th Royal Irish Rifles, and is at present stationed at Lurgan near Baffact

Mr. J. Pendreich, of the Pendreich Electrical Firm, Edinburgh, has been with the Expeditionary Force since the commencement of hostilities. His address is:—Corpl. J. Pendreich, Army Service Corps, c/o Requisitioning Officer, 8th Infantry Brigade, 3rd Division, British Expeditionary Force. In the "London Gazette" list of aliens to whom certifi-

cates of naturalisation have been granted lately the following

appear:— Wm. Sylvester de Ropp, Russia, electrical engineer, Ken-

Wm. Sylvester de Kopp, Russia, electrical engineer, Rensington, London.

Geo. Henry Funck, Germany, director of the Lubricating and Fuel Oils, Ltd., Westminster, London.

Jean Baptiste Annibal Légé, France, engineer and scientific instrument maker, Chelsea, London.

Otto Jens Marstrand, U.S.A., assistant to a civil engineer, South Norwood, London.

Roll of Honour.—A report presented recently to the Bradford Tramways Committee shows that no fewer than 187 men from the department have been engaged in active service on the Continent. The following employés of the Department have been killed:—Conductor A. Eushworth, Cleaner W. E. Harvey, Driver J. Kemp, Conductor J. Bamford, Conductor A. Padfield, and Conductor G. Garnham. The following have been wounded:—Conductor J. Craven, Conductor A. Conderson, Conductor M. Ratcliffe, Cleaner C. Bennett, Conductor J. Holdsworth, Flagman H. Walker, Driver P. Parker, Driver J. Boothman, Driver P. Walker, Conductor H. R. Smith, Conductor H. Enderby, Conductor A. Morton, Conductor H. Lea, Conductor A. Cryer, Conductor A. Bernhardt, Conductor W. Lane, Conductor C. Dennison, Conductor E. Clubley, Cleaner J. McIver, Conductor H. Hoste, Cleaner J. Corev, and Driver W. S. Marshall. Conductors A. E. Marsden and W. Challis, and P. Binns (labourer) are prisoners in Germany. Roll of Honour.—A report presented recently to the Brad

Keeping Turbine Blades Clean .- Impure water, even though treated, is sometimes the cause of a fine coating of lime forming on turbine blades. Lime, magnetia and graphite carried over with steam from water used in the boilers at Leavenworth, over with steam from water used in the boilers at Leavenworth, Kan, formed an objectionable coating on the blades of the turbine, making it quite a task to keep the machine clean. But now, since it has been found that kerosene injected into the ateam line will clean the blades, the turbine gives no more trouble. At a convenient spot in the steam line between the throttle and the valve rigging a small hand-pressure pump has been installed through which kerosene may be injected. Entering thus with the live steam, the oil particles are driven against all blades, and only an occasional injection from the pump is needed to keep the blades bright and clean.—Electrical World.

X-rays and Contraband.—At Boston, U.S.A., every bale of wool or cotton loaded for shipment to Germany is being subjected to an X-ray test for the prevention of the exportation of arms or other contraband that might be concealed inside. Representatives of the British Consulate are present with United States Customs officers to make assurance doubly sure.

FOREIGN AND COLONIAL TARIFFS ON ELECTRICAL GOODS.

NEW AUSTRALIAN TARIFF.

WE reprint from the Sydney Daily Telegraph certain portions of the new Excise Tariff which may be of interest to our readers; our contemporary considers that the most pronounced feature is the extended charges against goods other than of British manu-

BUSINESS NOTES.

Consular Notes.—TASMANIA.—Hydro-electric Installation.—The United States Consul at Hobart reports that the Government have purchased the partly-completed hydro-electric plant at Great Lake, about 60 miles from Hobart, and propose spending £100,000 at once towards it completion. A company has been working on this scheme for several years, and after spending nearly £500,000, had to cease work on account of lack of funds. It is intended to develop cheap power at Great Lake and transmit it to all parts of the State for industrial and lighting purposes. Most of the material and machinery necessary for this enterprise has been obtained. It is also proposed to spend over £400,000 upon railway and tramway construction work. While it is likely there may be some deductions therefrom, the United States Conful considers it practically certain that there will be much activity in this line of work during the current year, and that the demand upon foreign sources for all material necessary for such work, except sleepers, will be brisk. Such work is usually done by day labour under charge of the engineers of the State Railway Department. Consular Notes .- TASMANIA .- Hydro-electric Installa-Department.

BAGDAD.—The Tramway and Lighting Scheme.—The United States Consul at Bagdad reports the presence in that city of two surveyors who have been engaged in laying out the route for the proposed electric tramway. They were sent by the British interests controlling the concession, as a definite step to develop this enterprise. One of the chief hindrances to the construction of the tramway has been the narrowness of the Bagdad streets. The tramway has been the narrowness of the Bagdad streets. The surveyors have now been ascertaining how many, and which, buildings must be removed, and what such removal would cost. In addition to the concession for the tramway, the same interests are reported to have secured a concession for the erection of an electric lighting plant in Bagdad. Before the introduction of the crude-oil engine the price of coal in Bagdad (53s. to 70s. per ton) contributed toward making the installation of an electric plant a precarious venture from a financial point of view; but if an electric lighting and power plant using oil for fuel can be built in connection with the tramway, much of this uncertainty would be removed, provided the first cost of installation (including street widenings for the tramways) does not prove to be excessive.

LISBON.—Railway Electrification.—The United States Consul-

LISBON.—Railway Electrification.—The United States Consul-General at Lisbon reports the signature of a decree by the President of the Portuguese Republic for the electrification and lease of the railway connecting Lisbon with Cascais. The line is about 16 miles long and is owned by the Portuguese Railway Co. It serves the so-called Riviera of Portugal and, in the Consul's opinion, should be a paying investment. It is proposed to run electric trains every half hour and to make the entire run in 25 minutes.

SEVILLE.—Tramway Extension.—Writing on the subject of tramway extension at Seville, the American Consul there says that the river driveway in the direction of Palmera has undergone the river driveway in the direction of Palmera has undergone such changes during the past few years, with many new houses built in the Avenida de la Reina Victoria, that the Seville Tramway Co. have decided to extend their line to meet the needs of that neighbourhood. It is rumoured that work is about to commence on a new bull ring to seat 4,000 persons at Tabladilla, which will probably serve as an incentive to the early completion of the prejected tramway extension. It is anticipated that the construction of this tramway will do a great deal towards urbanising the evenus mentioned and that further improvements will result avenue mentioned, and that further improvements will result.

avenue mentioned, and that further improvements will result. NORWAY.—Electrical Manufacture.—According to a recent report by the United States Consul at Christiania, motor factories in Norway are developing rapidly, many of them having been enlarged during the past 12 months, and new ones established. A number of these factories have been joined in a union called A/S Det Forenede Motorfabriker (United Motor Factories), with head quarters at Bergen. Norwegian motor factories are in close competition with the Swedish, Danish and American manufacturers. Manufacturers of electrical machines and apparatus had a successful year. One of the largest manufacturers in this line, specialising in telephone apparatus, established a branch factory in Italy.

Italy.

KWANGTUNG.—In July last a contract was let to a Hong-Kong KWANGTUNG.—In July last a contract was let to a Hong-Kong firm for the erection of a small electric light plant at Kongmoon, Kwangtung Province, China. The contract called for Swedish engines and German dynamos and fittings. The United States Consul reports that as a result of the war the machinery has not arrived, and, in his opinion, the course of prices is such that it is likely the contract will be annulled.

Book Notices.—The Practical Engineer Electrical Pocket Book and Diary (London: Technical Publishing Co., Ltd., price 1s. 3d. post free) has been issued for 1915, with additions relating to ls. 30. poet iree) has been issued for 1915, with additions relating to electric motors, fuses, and wireless telegraphy; other features have been improved, and the useful lists of books appended to the various sections have been revised. A lengthy section is devoted to Acts of Parliament and Official Rules and Regulations, including those relating to electricity on board ship.

Glasgow, inform us that they have secured the sole selling rights
for the world of "Quartowatt" non-luminous heaters, which are manufactured in Glasgow,

Private Arrangements.—THE ALTHEAT Co., LTD., 62, Oxford Street, Lindon, W.—In pursuance of the provisions of the Companies (Consolidation) Act, a meeting of the creditors of the above was held on Monday, at the offices of the liquidator, Mr. A. Slatter, 62, Oxford Street, W. The liquidator stated that the liabilities of the company amounted to £370, although that amount might be slightly increased. The assets consisted of stock and book debts £346 estimated to realise £268. A lot of the goods possessed by the company consisted of gas and electric radiators, which had been sold on sale or return. There were no unpaid calls which had been sold on sale or return. There were no unpaid calls in arrear. The company was a private concern and was formed to develop patent gas stoves and electric radiators. They had been put on a commercial basis, and last July negotiations were proceeding for the formation of a company, with a capital of £15,000. Those negotiations were put a stop to by the war. The company was formed in 1912, with a nominal capital of £5,000. Shares of the value of £2,000 were issued to the vendor (Dr. Wild) for his patents. Of the remaining 3,000 shares all but about £700 worth were subscribed for. In answer to questions the liquidator stated that sums amounting to £300 had been loaned to the company, and that sums amounting to £300 had been loaned to the company, and charges given on the patents. There was also a sum of £30 at the bank, which was likewise subject to the charge. The opinion was bank, which was likewise subject to the charge. The opinion was expressed by creditors that the whole of the charges on the patents could not hold good as against the creditors, and the liquidator said he himself was of the opinion that one charge for £150 could not be enforced. After shortly discussing the position the creditors decided that an application should be made to the Court for the appointment of Mr. E. H. Hawkins, of Masses. Poppleton, Appleby and Hawkins, 4. Charterhouse Square, E.C., to ast as joint liquidator with Mr. Slatter in the winding up of the company. The liquidator stated that negotiations were in progress for the sale of the electric radiator patents, and for a reconstruction of the gas part of the business. The principal creditors are:—

description, with illustrations and diagrams, of the Cope's boiler-feed-regulator.

MESSAS. STEWARTS & LLOYDS LTD., Winchester House, London, E.C.—12-page catalogue of Scewarts' patent steel pipes for gas, water, sewage, &c. Excellent photographic reproductions are shown of pipes in course of laying in Caylon, Australia and elsewhere, and interesting information is given on such matters as the cost of laying, corrosion, protective coating, steel versus C.I. pipes; there is also a standard specification for lap-welded steel pipes.

MESSAS. KOHLER BROS. (incorporated with Crompton & Co., Ltd.), 56, Ludgate Hill, London, E.C.—8-page illustrated list describing the 'Standard' type Kohler electric printing machinery system, two and four-motor drive, and giving a list of prominent newspaper offices where it is in use.

MESSAS. ALFRED HERBERT, LTD., Coventry.—Monthly machine

MESSES. ALFRED HERBERT, LTD., Coventry.-Monthly machine tool review for January.

Liquidations.—THE UNIVERSAL BELTING Co., LTD.—A meeting will be held at 8, St. James's Square, Manchester, on March 6th, to hear an account of the winding up from the liquidator,

Mr. J. A. Ashley.

PREMIER LIGHTING AND ENGINEERING CO, LTD.--Mr. E. H.

Hawkins, of 4, Charterhouse Square, E.C., has been appointed an

additional liquidator in the voluntary winding up.

ACTON LAMP CO, LTD —Mr. Justice Joyce has appointed Mr.

J. Gib on Harris, F.C.A., R. ceiver and manager on behalf of the debenture-holders of this company, with power to carry on the business.

TANNETT WALKER & Co., Ltd., Hunslet, Leeds.—First meetings of creditors and contributories February 11th, at Leeds Law Institution, 1A, Albion Place, Leeds.

Bankruptcy Proceedings.—T. M. Woodcock, electrical engineer, Sheffield.-Trustee, (Mr. J. C. Clegg, Official Receiver, Figtree Lane, Sheffield), released December 21st, 1914.

H. H. Onley (O. Huxley), consulting engineer, Hanwell.—A first dividend of 1s. 8d. in the £ is payable on Fabruary 3rd, at the office of the Official Roceiver, 14, Bedford Row, W.C.

W. H. PEASE, electrical engineer, Sparborough.-A first and final dividend of 5/1. in the £ is payable on February 2nd, at the Official Receiver's offices, 14, Figtree Lane, Sheffield.

J. G. M. HILTON, electrical engineer, Birmingham.—Last day for proofs for dividend February 17th. Trustee, Mr. A. S. Cully. Official Receiver, 191, Corporation Street, Birmingham.

New Zealand.—An Auckland firm is inquiring for British agencies for c.i. pipes, water meters, oil engines, motor-cars and accessories, and electrical goods of all kinds. Communications should be addressed to H.M. Trade Commissioner for New Zealand, P.O. Box 369, Wellington.—B. of T. Journal.

Tiflis.—A local merchant who has hitherto imported from Germany is inquiring for British agencies for scientific instruments, steelware, and electrical appliances. Further communications should be sent to the British Consulate at Tiflis.—B. of T. Journal.

Netherlands.—There is stated to be a demand in the Natherlands at present for electric wire and cable. Communications should be addressed to the British Consulate-General, Rotter--Board of Trade Journal.

For Sale.—Aberdeen electricity department invites offers for the following second-hand plant: Two 100 K.V.A. Brush motorgenerators complete; Stockton-on-Tees electricity department have for disposal one 150-kw. Brush 'Universal' vertical reciprocating engine. Particulars are given in our advertisement pages to-day.

Calendar. -- From Ma. K. C. INOUYE, of 169, M stomachi Schichome, Yokohama, contracting agent of the Yokohama Electric Co., Ltd., we have reserved a wall calendar with daily slips for 1915.

LIGHTING and POWER NOTES

Aberdeen.—The Electricity Committee reports that 1,315,900 units were generated in December last, against 1,203,850 in December of the previous year, an increase of 85,050 units.

Accrington. - Gas Engine Trials. - The Electricity Committee has declined to accede to a request from Messre. Peebles & Son, L'd., for a reduction of the price charged for electric current supplied to them under their agreement.

The borough electrical engineer reports that the second of the new gas-engine generators has been run on trials, and that it is hoped to put it into normal use in a few days. The new gas-making and by-product plant is working satisfactorily. All the 1914 contract machinery is working, with the exception of a few auxiliaries, and these will be rapidly put in working order.

Australia.—The Doncaster (Vic.) Council has decided to first a loan of £2,000 for the purpose of installing an electric lighting scheme in the shire.

Barrow.—The Electricity Committee has decided to provide a supply of current to the Corporation gasworks for standby plan.

Belfast.—The Council, on the recommendation of the Tramways and Electricity Committee, has appointed a Committee, with the electrical engineer, to visit Brailord, Sheffield, Leeds and Greenwich, to obtain information as to administration and other matters relating to the electrical undertaking.

Bispham.—New Loan.—The U.D.C. has decided to increase to £320 the amount for which the L G.B.'s sauction has been asked in connection with the laying of electric lighting mains along Blackpool Road, this being the difference between the cost of overhead work and underground cables.

Blackpool.—Proposed Loan.—Application is to be made for LG.B. sanction to the borrowing of £24,500 for electricity extensions.

Blackrock.—L.G.B. Inquiry.—On January 26th an inquiry was held into the application of the local U D.C. for a loan of £13,000 for an electricity scheme. Evidence was given by Mr. Tierney, engineer of the scheme, and Mr. Spencer Hawes, who advocated Blackrock having its own scheme in preference to joining with Kingstown.

Brighouse.—ELECTRIC v. STEAM DRIVE. -The Sewage Committee of the T.C. reports that as a result of substituting electricity for steam for driving the lime crusher at the ewage works, the saving for the part 12 months had been £180. The wages bill had been reduced; energy had cost £54 as against £91 the average cost of coal for the past four years, also 75 hours per week had been worked as against 57 previously.

Brymbo. - E L. Scheme. - The Lighting Committee. has received the consent of the Public Works Loan Commissioners to borrowing £300 for the proposed electric lighting scheme. The tender of Messrs. Luxley & Co. has been recommended for acceptance, and a meeting is to be called to determine the rate to be charged for the work which is to be carried out at once.

Chelmsford.—RESTRICTED LIGHTING.—The Lighting Committee of the T.C. recommends that £200 be deducted from £417, the amount of the Electric Supply Corporation's account for the quarter, owing to the restricted lighting, and that the question of the amount of the rebate be considered at a future meeting.

-Messrs. Oscar Spoerer & Co. have permission to install an electric lighting system at the port of Tolcahuano.

-Workhouse Lighting.—A deputation from Charley.the B. of G. is to visit Ormskirk workhouse to obtain particulars of the electrical installation in vogus for heating, lighting and power purposes.

Cleckheaton.—Bulk Supply Proposal.—The Electricity Committee of the D.C. has decided not to take a supplementary bulk supply from the Yorkshire Electric Power Co.'s station at Thornhill.

The scheme adopted for the extension of the electricity works, at a cost of £8,500, was deferred in order to consider the Yorkshire E.P. Co.'s offer.

Connah's Quay.—Prov. ORDER.—The Council is to apply to the B. of T. for a prov. order in connection with the proposed electric lighting scheme; there are only two objectors, viz., the G.C.R. Co. and the Connah's Quay Gas and Water Co., and it has been decided to preceed with the scheme at once.

Continental. -– Norway. --The Government has for years been buying up waterfalls in the various parts of the country with a view to keeping some in reserve and harnessing them as required. Last year the State acquired in all six waterfalls or large water rights, which purchase involved a total capital expenditure of £15,400, and in this year's budget there is included a sum of £5,500 for the same purpose, which meet probably will be exceeded. The State has now become the owner of 38 waterfalls in all, which in unharnessed condition are estimated to represent a total of 155,490 electrical HP. When the estimated to represent a total of 156,490 electrical H.P. water is regulated and harnessed this amount will be brought up to 776,080 H P.

In regard to the situation of these waterfalls 12 800 HP. are located in the interior of the country, and a long distance from the sea, for which reason it is not possible to transmit the energy to the coast, and it will have to be employed for local purposes in the surrounding districts; 464,900 HP. are, however, to be derived from waterfalls, from which energy can with advantage be transmitted to the coast; 100,420 HP. have been bought up for the express purpose of supplying the necessary energy to the railways when these are electrified.

when these are electrined.

The remaining 197,600 are to be produced in falls which are situated in the direct vicinity of the coast.

The concessions given to private companies, and which are completed, number five in all. These are two concessions to the Rjukan Co. and one each to the Norwegian Electrical Metal Industry, the Motiven Pulp Manufactory and the Arendal Smelting Works, from which the State has derived fees amounting to £4 000 up to the present time. the present time.

GERMANY.—According to the Electrical Review and Western Electrician, a proposal has been submitted to the Prussian Ministry and the chief of the province of East Prussia suggesting the allocation of State funds for the electrification of the province, which has suffered severe damage. The dearth of labour and scarcity of horses will be obstacles in the way of revival of trade, and it is held that the use of electric power would be a remedy.

Cuba.—The Gaceta Oficial (Havana) announces that the Cuba.—The Gacela Oficial (Havana) announces that the following persons have been granted permission to install electric generating and lighting plant in Cuba:—Senor Eduardo R. Valera, at the town of Catalina de Güines, Province of Havana; Senor Manuel Andujar, at Ba'z, Prevince of Santa Clara; Senor Isidro Rovira, at Cabanas, Province of Pinar del Rio; Senor Donato Hernandez, at Arriete and Ciego Montero, Province of Santa Clara. In each case the concession will be rescinded if the plant is not in working order within a year from the date of the concession.—Board of Trade Journal. -Board of Trade Journal,

Doncaster.-HIRING CLAUSES.-A poll of the burgenees on the trading clauses of the Corporation's Parliamentary Bill resulted as follows:—For Clause 129, which gives the Corporation power to let on hire electric appliances, &c., 796; agains',

Dublin.—The Lord Mayor, at a meeting of the City Electricity Committee, expressed regret that the past year's working of the undertaking had not been as satisfactory as had been hoped, the trading having been seriously affected by the war and other matters outside their control. The Lighting Committee, in a report to the Corporation, asked for the amalgamation of that Committee with the Electricity Committee, to avoid overlapping of work. The growth of the electricity concern may, it is thought, make it necessary to use the Tara Street premises as a distributing

ASYLUM LIGHTING.—Mr. R. Jones, chairman, at a meeting of the Richmond Asylum Joint Committee, mentioned that the saving on the substitution of electric light for gas in the institution more than paid all the annual charges and repayment of capital of the new installation.

Dundalk.—The Council's electric lighting scheme is now making a profit. There was a loss on the first nine months' working of £163, and also a slight loss on the second year's working.

- The Woolwich borough electrical engineer has asked the Erith Council to consider the question of taking a bulk supply of electricity from the Woolwich Council or to allow it to supply current in the Erith district. The matter was deferred until after the appointment of the new engineer.

Eccles.—Public Lighting.—The borough electrical engineer is to submit an estimate of the cost of the Barrow system of electric lighting, as carried out on the length of tramway track from Swinton to Irlams-o'-th'-Height.

from Swinton to Irlams o'-th'-Height.

The Electricity Supply Committee of the Corporation has received an inquiry for terms for supplying electricity to the Manchester Ship Canal landing stage at Irwell Park, and has replied that it will be in a position to consider terms for supply on receiving from the company its decision in regard to the Committee's application for permission to take water from the caral for condensing processes. densing purposes.

Greenock.—New Loans.—The Corporation has decided to apply to the Scottish Office for permission to borrow an additional £20,000 for extensions. The T.C.'s plant represents a total capacity of 11,900 kw., of which 9,000 kw. is modern A O. plant, and it will be impossible to meet the obligations of the department next winter without an additional 5,000-kw. set. The £20,000 proposed to be borrowed is to be expended on the purchase of a new turbo-generator of 5,000-KW. capacity.

Haslingden.—New Loans.—Application is to be made

to the L.G.B. for sanction to the borrowing of £7,500 for the provision of mains, £1,500 for services, and £3 000 for the provision of transformers, switchgear, &., making £12,000 in all.

The Corporation has decided to supply electricity to the works of the Nobles Explosives Co., and Messrs. Haworth & Hartley.

So long as the public hall is used as a military hospital, a discount of one-third will be allowed off the charges for electricity.

Haworth.—The U.D.C. has decided to oppose the Yorkshire E.P. Co.'s proposed Bill.

Horrabridge.—E.L. Scheme.—The inauguration of the electric supply scheme took place last week; the installation, carried out by Mesers. Crampton & Co., includes a 25-H.P. Blackstone engine, coupled to a 15-KW. dynamo; a 12-H.P. water turbine, coupled to a 7-KW, dynamo; and a 200-ampere D.P. storage battery. Electricity is distributed by overhead wires to all parts of the village. Some 20 lamps, each of 50 CP., are in use for street lighting.

-The R.D.C. has decided to petition against Keighley .the Yorkshire Electric Power Bill. With reference to the Keighley prov. order formal objection has been lodged and the Board has appointed representatives to meet a Committee of the Keighley Corporation with reference to the terms of the order.

-Preparations are Leigh-on-Sea .- Public Lighting .to be made by the Southend-on-Sea T.C. for installing the electric light at the Broadway, a business centre. Leigh is now comprised in the borough.

Lexden and Winstree,-Workhouse Lighting.-The B. of G. was informed that there had been a decrease in the cost of electricity during the past three months, and that in another 12 months the Board would have saved enough on electricity to defray the cost of the plant.

imerick.—L.G.B. Inquiry.—On January 22nd, Mr. A. D. Price, L.G.B. Inspector, held an inquiry into an application by the Corporation for a loan of £5,000 for the purpose of providing additional plant at the electric power station.

Liverpool.—Annual Report.—The City Council has received sanction to borrow £40,000 for the provision of electric mains. The city electrical engineer, in his report on the estimates for 1915, remarks that during the past year the reconstruction of the Lister Drive, No. 1 station, has made satisfactory progress, and the first section of the boiler house has been completed, and results. The first of the 6,000 kw. sets has been run, and the second set is being assembled and will be completed very shortly. The engineer is of opinion that it would be advisable to deal with The engineer is of opinion that it would be advisable to deal with a portion of the plant in the destructor stations which has been in use for a considerable period, and has under consideration a scheme to replace some of these sets with plant of modern construction, and he has made provision for this work in the estimates. During the past year several trials have been made with electrical vehicles, and a 2-ton vehicle has been ordered to be used in connection with the cartage of mains' materials, stores. Sc.

London.—The annual meeting of the Metropolitan Boroughs' Standing Joint Committee has decided to ask the City and Borough Councils to request their Members of Parliament to oppose the London Electric Supply (No. 2) Bill.

L.C.C. BILL DROPPED.—At Tuesday's meeting of the L.C.C. the London and District Electricity Supply Bill, which has aroused London and District Electricity Supply Bill, which has aroused so much opposition in the municipal circles interested, in and round London, failed to receive the necessary majority to enable it to proceed in the present session of Parliament. A total of 69 votes was necessary in favour of the Bill, but the voting was 61 in favour and 32 against, 14 Reform members being absent on active service. Sir John Benn, while admitting the technical part of the scheme was satisfactory, said the financial part was disastrous. Mr. Norman pointed out that if the scheme was abandoned the Bill of the companies would hold the Parliamentary abandoned, the Bill of the companies would hold the Parliamentary field.

BETHNAL GREEN.—The B.C. has been recommended to oppose the London Electric Supply Bill. The Electricity Committee has approved plans of the electricity sub-stations proposed to be erected at New Tyssen and Digby Streets.

erected at New Tyseen and Digby Streets.

MARYLEBONE.—It is proposed to apply to the L.C.C. for sanction to borrow £6,500, in connection with the installation of trunk feeder protective apparatus.

Luton.—Street Lighting.—The Lighting Committee of the T.C. has considered the question of discontinuing the lighting of streets by electric lamps and reverting to gas lighting, but has postponed further consideration of the matter until its next meeting, in order that the borough engineer may furnish particulars of the annual expenditure in lighting streets by electricity.

Maidstone.—New Turbine Plant.—The Electricity Committee recommends that a 1,000-kw. turbo-alternator be installed, at a cost of £5,300, and also that notice be given to large consumers that owing to the great increase in the cost of coal it may be necessary to raise the price of current as from January 1st under new contracts.

Newbury.—Hospital Lighting.—It has been decided to have the electric light installed at the Isolation Hospital.

Oldham.—Supply of Motors.—Representatives of the Chamber of Trade have interviewed the chairman of the Electricity Committee of the Corporation, who explained the difficulty under which the department laboured in its endeavour to extend the use of electricity, and that no encouragement was given to people to apply to it, and only in certain cases had it supplied motors, when it was feared the business would be lost. The interview closed with an arrangement by which the members of the trade would co-operate with the department in extending the use of electricity in other directions.

Orniskirk.—At a meeting of ratepayers on January 29th it was unanimously decided to petition the U.D.C. urging opposition to the Ormskirk Gas and Electricity Bill, which the Ormskirk Gas Light Co. has promoted.

Penistone. — WORKHOUSE LIGHTING. — The L.G.B. has sanctioned an expenditure of £124 for lighting the workhouse premises by electricity.

Peterborough.— IMPROVED WORKING.—The revenue from the electricity works for December last was £1,299, as against £1.144 the previous year, and the surplus £828, as against £616. The engineer reported that the cost of production had been reduced from '9.1. per unit to '761., a reduction of 16 per cent. in generation costs, due to the greater efficiency of the turbo-generator and mechanical stokers, the whole of the new plant having been in use throughout the month.

Reigate.—Prov. Order.—The R.D.C. has decided to consent to the application of Mr. Gilbert Allom for a prov. order for E.L. at Chipstead.

Salford.—Sewage Pumping, &c.—A report with reference to the provision of electrically-driven pumping plant at the sewage works, has been approved. The T.C. has been recommended to authorise the purchase of an additional turbine-driven boiler-feed water pump and feed-water heater at the electricity station.

At the recent Council meeting a resolution was to be brought forward to the effect that a Special Committee be appointed to control the lighting of the borough, and that the Committee should consist of four members of the Electricity Committee, four members of the Gas Committee, along with six other members of the Council

Southampton.—TARIFFS.—The electrical engineer has reported upon the suggested adoption of a different type of charge for domestic purposes, i.e., a fixed charge per annum based upon the rateable value of the premises (or upon the kw. installed) plus \(\frac{1}{2} \)d. per unit metered, but does not recommend any alterations in the charges at the present time, in view of the fact that it had recently been decided that the fist rate was the most suitable for the town. The Council has agreed with the views of the engineer.

Stallybridge.—The Generating Station Committee of the Joint Board has authorised the engineer to spend not more than £25 on experimental lighting of workmen's dwellings.

The price of electricity for heating and cooking purposes has been fixed at \(\frac{3}{4}\)d. per unit not, subject to a meter rent of 6d. per quarter.

Stoke-on-Trent.—The L.G.B. has informed the Electricity Committee of the T.C. that it is not prepared to sanction a further loan in respect of land for the power house, and asking what steps the Council proposes to take with regard to the overarft on revenue account of £6,800 on March 31st last. The Committee has decided to give an undertaking to liquidate the overdraft referred to during the next three years. The Finance Committee recommends the town clerk to try and arrange with the Board that the three years shall commence upon the termination of the war.

NWAINSCA.—The Estates Committee has recommended the extension of a lease to a local timber merchant subject to his using electric power instead of suction gas, as to which complaints have been made. It was urged that this was a form of coercion, but eventually the Committee's recommendation was adopted.

Sunderland, — RECEIPTS AND ESTIMATES. — The estimates of the Corporation supply undertaking for the year ending March, 1915, show a probable income of £65,801, as compared with £67,514 the previous year, made up as follows:—Power and heating, £33,610; private lighting and heating, £18,115; tramways, £11,339; sales department, £4,000; and public lighting, £2,735. The working expenses are estimated at £36,122, compared with £35,221 last year, the net revenue being £35,933, as against £37,296. After repayment of loans, interest and other outstanding charges the balance remaining of £6,852 will be placed to the renewals fund.

Surrey.—The County Council has unanimously decided to oppose the Lindon Electric Sapply Bill; the Richmond T.C. has already decided to petition against it.

Warrington.—School Lighting.—The Electricity and Tramways Committee's offer to provide electricity to Oakwood Avenue Council School, upon a guaranteed revenue of £50, has been accepted by the Education Committee.

Willesden.—The Electricity Committee of the U.D.C., reporting upon the effect of the war upon the amount of electricity used, stated that in the Christmas quarter of 1914 the number of units used was 1,887,533 as compared with 1,431,374 in 1913 and 1,211,760 in 1912.

TRAMWAY and RAILWAY NOTES.

Aberdeen.—TRAMWAY PURCHASE.—The Corporation Tramways Committee, having under consideration the proposed purchase of the Suburban Co.'s system, has agreed to obtain the advice of Mr. Dalrymple as to the value of the undertaking.

Argentina.—The City and Suburbs of Buenos Aires Tramways Co., concessionaires of a tramway line from the municipal boundary to the Tigre, recently notified the Government of the Province of Buenos Aires that they found it impossible to comply with the requirement of the concession that the works of the first section should be terminated within 15 months. They therefore asked to be allowed 18 months, and the Provincial Government has socoorded the extension of time asked for.—Review of River Plate.

Barnsley.—B. of T. REPORT.—Lieut.-Col. von Donop, in reporting on the tramway accident which occurred on December 2nd—which was reported in our pages at the time, and was due to the conductor of a car which was standing on a falling gradient, releasing the brakes by mistake when the driver was absent, thus allowing the car to run away down the hill—attributes it to want of care and promptitude on the part of the driver and conductor. The former he holds largely responsible, while the latter failed, apparently without reason, to apply the hand or slipper brakes from his end of the car. The inspector points out, however, that the short length of 1 in 50 gradient is not a suitable place for a tramway terminus, and that the driver should not be allowed to leave his car when it is standing there.

Barrow.—The T.C. has decided to urge upon the British Electric Traction Co. the necessity for increasing the number of electric tramway-cars at Barrow, the renewal of defective points, and greater passing place accommodation on the Abbey Bead route.

Blackpool.—The Corporation proposes to borrow £675 for the purchase of four top-deck covers for tramcars.

Burnley.—A Sub-Committee is considering the application of the tramway employés for permission to form a rifle club at the depôt.

Continental. — NORWAY. — The electrification of the railway between Kiruna and the Riksgränsen Station on the Norwegian frontier has now been completed, and traffic was opened on January 19th. Loaded trains of 40 wagons are run at a speed of 60 km. per hour; previously the highest speed allowed was onely 27 km. The work has been successfully carried out, although accompanied by some mishaps, among which may be mentioned that the telegraph line from Sweden to Narvik has been put out of service altogether, due to induction effects. Steps have now been taken to lay a double telegraph line. The telephone line is a double line supplied with discharging poles and transformers, and the induction on this is very small.

Prof. Pleyl and Engineer Holmgreen, of Stockholm, have now solved the problem in regard to induction as far as the telegraph line is concerned.

Edinburgh,—TRAMWAY EXTENSIONS.—The Tramway Committee has considered the proposals of the County Council with regard to the proposed tramways in the city's prov. order. In the case of the Corstorphine extension there appears to be little difficulty in the way of an agreement between parties, and it is hoped that the line, the construction of which has become a pressing need since the opening of the Zoological Park, will be laid down. In regard to the Colinton-Craig Lockhart extension, difficulties have arisen regarding road widening. Recent developments in the Colinton district have shown need for transport facilities.

Eccles.—A Sub-Committee of the Salford Corporation is considering term; upon which the latter would be prepared to undertake liability for the repair and maintenance of the overhead tramway electrical equipment.

Halifax.-NINE MONTHS' WORKING.-For the nine months ending December 31st, the income from the tramways v £87,907, and the expenditure £75,972, leaving a profit of £11,935.

India.--The Railway Board has decided to equip all passenger trains with electric light and to discontinue the use of gas for train lighting. Electric lighting is exclusively used on some of the narrow gauge lines.

London.—" BAKERLOO" EXTENSION OPENED.—On Sunday last the greater part of the Queen's Park extension of the "Bakerloo" tube was opened for traffic, the line being completed, although the Queen's Park station is not yet available for use, so that a temporary terminus for passengers has been made at the preceding station, Kilburn Park, the other intervening stations to Paddington being Maida Vale and Warwick Avenue. All the stations are equipped with escalators between the booking halls and platforms below. The new line runs out into the open near Queen's Park, the last quarter mile being beside the North-Western line. Automatic and semi-automatic signalling on the McKenzie, Holland & Westinghouse Co.'s electro-pneumatic system has been installed, similar to that in use on the older section of the line, except that A.C. track circuits have been adopted. Ultimately it is intended to run four through trains an hour over the new line between Watford and the Elephant and Castle Station (the South London) donterminus), and there will also be numerous connections at Queen's Park between the North-Western Co.'s Watford service and the tube service, terminating at Queen's Park. At an inspection of the line on Friday last, four all-steel cars were used, fitted with a special system of radially opening doors, with safety indicators under the gateman's observation.

Manchester .- TRAMWAY EXTENSIONS .- The Tram; Manchester.— TRAMWAY EXTENSIONS.— The Tram, ways Committee has intimated its willingness to pay the extra cost of an additional strip of land to be acquired for the purpose of widening the proposed new Southern Road from 80 to 108 ft., the object of the Committee being to have this additional strip specially reserved for tramway purposes on which a special type of tramway track would be constructed which would enable better transit facilities to be provided. It is recommended that stepy be taken with a view to an application being made to Parliament for an extension of time for the construction of tramways in Stretford and Davyhulme, authorised by the Manchester Southern Tramways Act, 1903.

The all-night car service, which has now been in operation more

The all-night car service, which has now been in operation more than a year, and which has proved a great boon to night workers, is to be continued for another year.

-Female Conductors.--At a meeting of Newcastle.~ the Tramways Committee on January 28th, the general manager remarked on the scarcity of men in the city, and said that with the sanction of the Committee he was contemplating employing femals conductors on some of the quieter routes. The matter will probably be brought forward at the next meeting of the Committee

Rochdale.—TRAMWAY ACCIDENT.—A collision occurred on January 27th between two tramway cars in Whitworth Road; both drivers' platforms were crushed and the drivers pinned against their control apparatus and seriously injured. Two passengers also complained of injury.

South Shields. - A TRAMWAY PROPOSAL. - An interest-South Shields.—A TRAMWAY PROPOSAL.—An interesting proposal, brought before the Tramways Committee, is an extension of the system by incorporating with it the system of the Jarrow and South Shields Light Railway Co., which extends from Jarrow to Tyne Dock in South Shields, where it joins the system of the Corporation. The matter is still in embryo. but it is understood that shortly a deputation will wait upon the Jarrow Corporation to ascertain its views on the matter. About a dozen or more years ago the present proposal formed part of the scheme of the then South Shields Tramways Co., whose complete scheme included a line southwards to Sunderland, while other sections of what was practically the same scheme were intended to connect what was practically the same scheme were intended to connect Jarrow with other towns on Tyneside, and, through Gateshead, westward with some of the colliery districts adjoining the latter borough. The ballot at South Shields as to the promotion of a Parliamentary Bill for (inter alia) tramway extensions, resulted in 2,376 voting for the proposal, and 1,180 against it, so that the Bill will be proceeded with.

Stalybridge. — Proposed Tramways. - The Ashton-Stalybridge. — PROPOSED TRAMWAYS. — The Ashton-under-Lyne T.C. and Denton, Audenshaw, and Limehurst D.C.'s have each decided to oppose in Parliament the Bill promoted by the Stalybridge Joint Tramways Board, one of the objects of which is to take over the tramways of the Oldham, Ashton and Hyde Electric Tramways Co., whose lease will shortly expire. The Parliamentary Bill is also being opposed by the Town Councils of Dakinfield and Mossley (who are part owners of the Joint Board Tramways), on the ground that the proposed extension of the tramways in the direction of Glossop is not required.

required.

The Joint Board at a meeting on January 28th confirmed the promotion of the Bill. The General Purposes Committee has decided to insert a clause to the effect

that no project for the supply of electricity or tramway service outside the four boroughs—Stalybridge, Hyde, Mossley and Dukinfield—be proceeded with unless two-thirds of the members of the Board vote in favour.

Sunderland.—TRAMWAY EXTENSIONS.—The estimates for the year ending March 31st, 1915, show an anticipated total revenue of £74,882, compared with £75,226 (actual) for the previous year. The expenditure is put down at £42,246 for working expenses, and there is a balance of £32,636 to carry to the net ravenue account. From the net revenue account £10,374 will be taken for the payment of loans, and £6,463 for interest, £1,217 for income-tax, £8,145 for the reserve and renewals fund, and £5,000 for the relief of the rates. This latter is the same amount as has been devoted for that purpose for several years.

U.S.A.—CO-OPERATIVE ELECTRIC VEHICLE GARAGES. U.S.A.—CO-OPERATIVE ELECTRIC VEHICLE GARAGES.

—A scheme that is expected to give an impetus to the adoption of the pleasure type of electric motor vehicle is at present being developed by the New York Electric Vehicle Association. It is that of establishing a co-operative garage in the West-end of New York, specially adapted to the storage and maintenance of this type of automobile, at a uniform charge of £9 per month, this charge to also include the cost of the current required for the charging of the battagies and the cleaning of the vehicles. In charging of the batteries, and the cleaning of the vehicles. connection with the garage a showroom is to be established in which the cars made by the firms co-operating in the enterprise will be offered for sale.

TELEGRAPH and TELEPHONE NOTES.

Illicit Wireless Installations.—At Wood Green Police Court, on January 29th, S. W. White, 17, a wireless telegraph student, was charged with having in his possession, without the written permission of the P-stmaster-General, a complete wireless installation. The accused was remanded on bail.

Long-Distance Telephony. — Telephonic communication has been inaugurated between Washington and San Francisco, viâ New York and viâ Boston, a distance of about 5,000 miles. The feat was made possible by loading the line with Papin coils.

Telephonic Interruptions.—It is stated that the storm last month brought down more than 12,000 wires in London and the South of England—mainly in South London, where the service taken over from the National Telephone Co. is on the overhead taken over from the National Telephone Co. is on the overhead system. The snow fell in a damp, clinging condition, and accumulated on the wires, afterwards freezing, and under these conditions a breeze brings them down wholesale. Owing to the shortage of labour, great difficulty has been experienced in repairing the damage, and it will take a considerable time to complete the work of restoration. of restoration.

It is stated that 80 per cent, of the overhead lines south of the

river broke down, and the storm was the worst on record in this respect. The snow formed a coating 1½ in. thick on the wires.

As 1,000 out of the normal staff of 4,000 men had enlisted, the Post Office engineers were severely handicapped, and were glad to have the assistance of 100 skilled linemen from the Royal Engineers, lent by the War Office.

The Telegraphic Union.—The Journal Télégraphique, the official organ of the International Bureau of the Telegraphic Union, at Berne, had to suspend publication in August last, but has resumed its activities with the issue for January 25th.

United States.—The Marconi Wireless Telegraph Co. of America, states that the trans-Atlantic high-power stations at New Brunswick, N.J., and Belmar, N.J., were completed and were being tested out when the European war interfered with the work, the English Government having commandeered the corresponding stations at Carnarvon and Towyn, Wales. The trans-Pacific service was opened on September 24th, and uninterrupted communication is being maintained with Honolulu. Within a few mouths the company's high-power stations in Massachusetts—the transmitting station in Marion and the receiving station in Chatham will be complete and ready for service with Norway, Russia and Northern Europe. The Japanese station, which is to work in connection with the trans-Pacific system, will be ready at the end of April and will thus complete the trans-Pacific link.—Telegraph and Telephone Age.

CONTRACTS OPEN and CLOSED.

OPEN.

Aberdare.-March 6th. U.D.C. Twelve months' supply of cables, meters, joint-boxes, &c., lamps, uniforms, tickets and other stores. See "Official Notices" to-day.

Australia.—Brisbane.—March 10th. Motor-generator, power board, &c., for Postmaster-General. See "Official Notices" January 15th.

MELBOURNE.—March 16th. White Wheatstone receiving tape, for Postmaster-General. See "Official Notices" to-day.

Aylesbury.—February 6th. U.D.C. Supply of electric motors to consumers (hire-purchase agreement). See "Official Notices" January 22nd.

Bedwas.—March 4th. Electrical goods for 12 months, for the Bedwas Navigation Colliery Co., Ltd. Forms of tender from the Secretary.

Belfast.—February 10th. Twelve months' supply of electric lamps, carbons, fittings, batteries, &c., for the Midlaud Bailway Co. Northern Counties Committee (Ireland). Forms of tender from Mr. Ellis, Stores Superintendent, York Road Station,

Birkenhead. — February 8th. Corporation. Twelve months' supply of electrical and tramway stores. Forms of tender from Mr. G. P. Shallcross, Borough Electrical Engineer, Craven

Blackburn. — February 13th. Corporation. Twelve months' supply of stores, including a number of electrical items, for the Electricity Committee. See "Official Notices" Jan. 29th.

Blackpool. — February 17th. Corporation. Uniform clothing for tramway traffic staff. Traffic Superintendent's office, Blundell Street derôt.

Bolton. — February 11th. Corporation. Low-tension sub-station switchgear, for the Electricity Department. See "Official Notices" January 8th.
February 22nd. Corporation. Twelve months' supply of stores, for the Tramways Committee. See "Official Notices" to-day.

Bristol.—February 11th. Twelve months' supply of carbons, joint, junction and fuse boxes, wattmeters, ampere-hour meters, boiler castings, globes, &c. See "Official Notices" Jan. 29th.

Cardiff.—February 22nd. Installation, 750 points, at New Technical Institute, Cathays Park, for the City Council. See "Official Notices" January 22nd.

Corporation. Colchester. — February 6th. months' supply of storee, including lighting fittings, car equipment, overhead equipment, cable, &c. See "Official Notices" January 22nd.

Glasgow.—The General Finance Committee of the T.C. has remitted to ex-Bailie Arch. Campbell and the Superintendent of Clocks to arrange for the renewal of the electric clock batteries in connection with the installation of electric clocks in the northwestern district of the city.

-April 1st. Twelve months' supply of Gloucester. – stores, for the Electricity and Light Railways Committee. Forms of tender from Mr. F. H. Corson, General Manager, Light Railways Offices, Bristol Road.

Halifax.—February 15th. Corporation. Twelve months' supply of stores, including lighting fittings and electrical accessories, cables, telephone wire, meters, &c. See "Official Notices" January 22nd.

Ilford. — February 23rd. U.D.C. Twelve months' supply of stores for the electricity works. See "Official Notices" to-day.

Llandudno. — February 12th. U.D.C. 440-B.H P. compound condensing steam engine, and 300-kw. multipolar dynamo, &c. Particulars from the Clerk, Town Hall.

Leeds.—February 20th. Corporation. Twelve months' supply of stores, including cable, mains boxes and fittings, jointing and insulating material, electric lamps, fittings, &c., for Electric Lighting Department. See "Official Notices" January 22nd. February 17th. Electrical work, Hough Lane School, Bramley, for the Education Committee. Education Architect.

London.—Bermondsey.—February 5th. B.C. Twelve months' supply of carbons and brushes, cable and jointing material, stoneware conduits, meters, demand indicators, main fuses, oils, meter boards, street frames, covers and joint-boxes. See "Official Notices" January 22nd.

L.C.C.—February 10th. Installation (184 wiring points, 246 lighting points) at Scawfell Street Elementary School, Hackney. See "Official Notices" January 29th.

H.M. Office of Works,—February 12th. Cylinder and machinery oils for one year. Controller of Supplies, 18, Queen Anne's Gate, S.W.

Annes Gate, S.W.

ISLINGTON.— February 24th. Twelve months' supply of electrical stores, for the B.C. See "Official Notices" to-day.

ST. PANCRAS.—February 15th. B.C. Arc lamp carbons, for the Electricity Department. See "Official Notices" January 29th. St. MARYLEBONE.—February 17th. Stores, including meterboards, casings, &c., cables, box compound and insulating materials, &c., for Electricity Department. See "Official Notices" Jan. 29th.

Manchester. — February 16th. Corporation. Twelve months' supply of stores for the Tramway Department, See "Official Notices" January 29th.

Newcastle-under-Lyme.—February 5th. Three-wire single, L.T. paper, lead-covered cable, armoured feeder and distributor mains, for the Electricity Department. See "Official Notices" January 22nd.

Portsmouth. — February 16th. Corporation. months' supply of stores, for the Tramwsy Committee. "Official Notices" to-day.

Rotherham. — February 22nd. Corporation. Two water-tube boilers, automatic mechanical atokers, economisers, superheaters, foundations, steel chimneys, steam valves, steam pipes, induced-draught plants, and all auxiliaries. See "Official Notices" January 29th.

Southend-on-Sea.—February 5th. Corporation. 140 tons of Sandberg steel rails and fishplates (specifications, &c., £2 2s., returnable), and 26 steel poles with bra kets and soroll. Mr. E. J. Elford, Borough Engineer, Clarence Road.

Spain.—February 15th. The municipal authorities of Prat del Llobregat (province of Barcelona) are inviting tenders for the concession for the electric lighting of the town during a period

February 18th. Tenders are being invited by the municipal authorities of Canalijas de Penafiel (province of Valladolid) for the concession for the electric lighting of the town.

Stockton-on-Tees.—February 19th. Corporation. Two 500-kw. rotary converters, transformers and starting apparatus. See "Official Notices" to-day.

Swindon. — February 17th. Corporation. Four-way and other stoneware conduits, for the Electricity and Tramway Department. See "Official Notices" to-day.

CLOSED.

Bolton.—The Electricity Committee has accepted the tender of Mr. Wm. Gornall for the construction of the Bradshawgate sub-station.

Delagoa Bay.—A contract for 12 months' supply of direct-ourrent ampere-hour meters to the Delagoa Bay Development Corporation has been placed with the Electrical Apparatus Co., Ltd.

Glasgow. — The Tramways Committee recommends acceptance of the following tenders:

Commutators.—P. R. Jackson & Co., Ltil.
Lead-covered cables.—J. Hally Craig.
Motor at mature colls.—Manchester Armature Repair Co.
D.C.C. wire.—B I. & Helsby Cables, Ltd.; London Elsotric Wire Co. and
Smiths, Ltd.

The Committee has accepted the offer of the Otis Elevator Co., Ltd., for a new goods elevator in the extension of the head office, and an alteration on the existing passenger lift at the head office.

The Clyde Navigation Trustees have accepted the offer of the

St. Helens Cable Co., Ltd., for the supply of electric cable.

Huddersfield.—The Electrical Apparatus Co., Ltd., has received a contract for 1,000 single-phase meters for the Corporation.

Hull.—The tender of Messrs. Siemens Bros. Dynamo Works, L'd., amounting to £135, for three motors (10 H.P.), for driving the machinery in the new workshops, has been accepted by the Corporation Tramways Committee.

Leyton.—The tender of Mr. R. H. Bacon has been accepted by the U.D.C., at £125 10s., for work at the water-cooling

Having regard to the present difficulty in the supply of materials, the Urban District Council has decided, in connection with the contracts expiring on March 31st next, to obtain quotations for a six months' supply only of service-line cable and are lamp carbon. With regard to engine oils, the Electrical Engineer has been directed to communicate with the present contractors with a view to the renewal of their contracts upon the same terms. Messrs. W. Cory & Sons, contractors for the supply of slack coal to the electricity works, cannot now undertake to supply at contract price up to more than 50 or 60 per cent. of the quantities ordered. The firm offers to make up the balance with other equal nutty slack at a price which is 2s. above the contract rates. Having regard to the fact that no good purpose would be served by inviting tenders (the present contract expiring on March 31st next), the Electrical Engineer has been authorised to make the best arrangements he can with the present contractors or others for the supply of the Having regard to the present difficulty in the supply of materials, can with the present contractors or others for the supply of the

Liverpool.—The City Council has been recommended to

Sutton Heath and Lea Green Collieries Co., Ltd.—Annual supply of best quality steam slack.

Walter Scott, Ltd.—2,500 tons, Sandberg silicon steel tramway rails, 131 lb. per lineal yard; 100 tons, Sandberg silicon steel tramway rails, 131 lb. per lineal yard; for curves; and 40 tons, fishplates.

Hadfields, Ltd.—100 tons tie-bars.

-Shoreditch.—The Electricity Committee has received the following tenders for the supply of lead-covered, paper-insulated single and twin cable required for services during the period ending March, 1915:-

.0024 .085 .095 sq. in., sq. in., sq. in., single, single, single, sq. in., twin. £185 187 180 187 192 Siemens Bros. & Co., Ltd. (accepted)
Westers Electric Co., Ltd.
W. T. Henley's Tele. Works Co., Ltd.
W. T. Glover & Co., Ltd.
B.I. & Helaby Cables, Ltd. #87 88 89 90

To be in accordance with the specification of the British Engineering Standards Committee, and, as regards the single cable, suitable for a working pressure of 660 volts D.C, and the twin

cable 1.100 volts D.C.

HAMMERSMITH.—The Electricity Committee reports that four HAMMESSITH.—The Electricity Committee reports that four tenders only were received for the supply of mechanical stoker coal for a period of one to three years, and in each case the tenderers added conditions which made the acceptance of the tenders without value. In these circumstances, and with the object of increasing and maintaining the coal reserve, the Committee has authorised the borough electrical engineer, in consultation with the chairman and, where possible, with the Committee, to accept satisfactory offers of coal up to 3 000 tons, advantage being taken as far as received in the prices offered by the tenderers.

possible of the prices offered by the tenderer.

STEPNEY.—The B.C. Electricity Committee reports the purchase of 4,300 tons of coal for the electricity undertaking in lots of 100 to 500 tons, at prices ranging from 8s. 9d. to 19s. 6d. per ton; also the acceptance of the offer of Mesars. Foster & Co. to supply 100 tons per week of Kingsbury fine slack coal at 10s. 1d. per ton for 12 months from February 1st, for the Limehouse generating station. The Borough Electrical Engineer reports that the British Central Electrical Co., Ltd., have informed him that, as the French Central Electrical Co., Ltd., have informed him that, as the French Government have prohibited the exportation of carbons, they are unable to carry out their tender for 10,000 pairs of carbons accepted by the Council on January 6th. The Committee reports that, on the advice of the Electrical Engineer, it recommends the acceptance of the quotation of Mesers. Geipel & Co. to supply 10,000 pairs of carbons of the National Carbon Co.'s make, at £12 15s. per 1,000 pairs, the order to be placed as and when required. The Committee also reports the acceptance of the offer of Mesers. W Gainel & Co. for 7,000 pairs of flame are carbons at 18s. per W. Geipel & Co. for 7,000 pairs of flame arc carbons, at 18s. per

100 pairs. L C.C.— LC.C.—A contract for the supply of electric lamps (Schedule No. 17) has been placed with the Edison & Swan United Blectric Light Co., Ltd. Items 8 to 27 (metallic-filament lamps with filaments of "drawn" wire in one continuous length).

Manchester.—The following tenders have been accepted by the Electricity Committee :

Two 500-x.v.a. additional transformers.—Johnson & Phillips, Ltd. One 500-x.v.a. additional motor-converter.—Bruce Paebles & Co., Ltd. Cable.—B.I. & Helaby Cables, Ltd. Copper to be made up into cables.—B.I. & He'sby Cables, Ltd.

The Education Committee has accepted the tender of Meesrs. Higgins & Co., Manchester, for the electric light installation at the Old Hall Drive Municipal School.

The Tramways Committee has accepted the following tenders: Permanent-way spec'al trackwork.—Hadfields, Ltd.; Titan Trackwork Co., Ltd.; Loraio Steel Co.
Permanent-way points, tongues and hardened-steel centres.—Edgar Allen and Co., Ltd.;

Neath.—The U.D.C. has placed a 12-months' meter contract with the Electrical Apparatus Co., Ltd.

Romford.—The following tenders have been received by the Guardians for the reorganisation of the House telephone service, including the provision of new cables, instruments and batteries :-

Private Telephane & Elect	rio	Co., L	td.	••	• •		£'9
General Electric Co., Ltd.							73

Siemens Bros. & Co., Ltd.		••		••	10		_
Young & Mar'en, Ltd.	• •		•••				92
Turnham & Co			••		••		91

The lowest tender has been recommended for acceptance.

Ship Lighting.—A contract for the supply of "Royal Ediswan" lamps for one year has been given by the British India Steam Navigation Co. to the Elison & Swan United Electric Light Co., Ltd.

Southampton.—The T.C. has decided to extend the contract with the British Electric Transformer Co. for a further period of two years.

Stalybridge.—The Joint Board has accepted the tender of the Scurtevant Engineering Co, Ltd., for two air filters.

The Electricity Committee recommends the acceptance of the tender of the Worthington Pump Co., Ltd., for a forced draught cooling tower, at £2,128, including the cost of toudations for a second tower when required, and the tender of the British Thomson-Hou-ton Co.. for alterations and improvements to the switchboard at the Electricity Works, at £176 10s. 6d. It also recommends the acceptance of the tender of the same company for specially designed switchgear required in connection with the charging of the electric omnibuses, at £80 per set for each of the two boosters.

FORTHCOMING EVENTS.

Royal Institution of Great Britain.—Friday, February 5th. At 9 pm. At Albemarle Street, W. Paper on "Science and Industrial Problems," by Prof. A. W. Crossley, F.R.S.

Association of Mining Electrical Engineers (London Branch).—Friday, February 5th. At 8 pm. At Northamp'on Polytechnic Institute, St. John street, Clerkenwell, E.C. Paper on "Protec'ive Devices Against Lightning and Surges," by Messrs. E. K. Scott and L. F. Frogarty.

Plants Warmark Resident Monday Sch. At Million Restaurant

ctro-Harmonic Society.—Monday, February 8th. At Holborn Restaurant, Ladies' Night.

Institution of Mechanical Engineers (Graduates' Association).—Monday, February 8th. At 8 p.m. At 8 sorey's Gate, 8.w. Annual Lecture on "History of the Metallurgy of Iron and Steel," by Sir R. A. Hadfield, F.R.S.

Hadfield, F.R.S.
Institution of Civil Engineers.—Tuesday, February 9th. At 8 pm. At Great George Street, S.W. Paper on "Engineering Operations for the Prevention of Malaria," by Mr. F. D. Evaus.

Association of Engineers-in-Charge.—Wednesday, February 10th. At 780 p.m. At 8t. dride's Institute, Bride Lane, E.C. Paper on "Bollers and Boiler Mountings," by Mr. Vernon Smith.

Saturday, February 18th. Social and Dance.

Institution of Automobile Engineers.—Wednesday, February 10th. At 8 p.m. At Institution of Mechanical Engineers, Stoley's Gate, S.W. Paper on "Magneto Ignition," by Mr. J. F. Henderson.

Institution of Electrical Engineers —Thursday, February 11th. At 8 p.m. At Victoria Embankment, w.C. Paper on "Conditions Affecting the Variations in Strength of Wireless Bignals," by Prof. E. W. Marchant.

variations in Steangth of Wireless Signals," by Prof. M. W. Marchaut.

North of England Institute of Mining and Mechanical Engineers.—
Baturday, February 18th. At 3 p.m. At Newcastle-upon-Tyne. General Meeting.

THE E.T.U.: LONDON DISTRICT.

WE have received from Mr. J. Potter, district secretary of the Electrical Trades Union, the following report of a meeting of the London members of the Electrical Trades Union held on Saturday last, in the Chandos Hall, at which the joint report of the sub-Committees of the L.E.M.A. and the E.T.U. was adopted, together with resolutions for an advance of wages, Government intervention with regard to food prices, and a protest against the method proposed for making financial grants under the Housing Act, 1914.

Brother Rolf occupied the chair, and after a few preliminary remarks, called upon the district secretary to give the report of the Joint Board of the L.E.M.A. and the E.T.U.

Brother Potter stated that the period of six months' trial of the L.E.M.A. Working Rules having expired, the Board had drafted a report which was being placed before both Associations. In the first instance, the employers had drafted a report, which they afterwards withdrew in favour of the report presented by the delegates from the Union, to which they had made small additions. (These additions are marked by capital letters). Electrical Trades Union, the following report of a meeting of the

(These additions are marked by capital letters).

January 28th, 1915.

To the London Electrical Masters' Association. To the Electrical Trades Union,

REPORT OF JOINT BOARD.

"1. The Joint Board appointed for the purpose of investigating, over a period of six months from July 1st, 1914, complaints in respect to the operation of the Working Rules issued by the London Electrical Masters' Association, 1914, has met on four London Electrical masters Association, 1914, has met on four occasions, viz.:—November 3rd, November 24th and December 17th, 1914, and January 28th, 1915.

"2. The Board has dealt with a number of complaints as to breaches of the Rules by members of the Masters' Association and

non-members, comprising:—Eight breaches of Rule 1 (Disability), 12 breaches of wages, and five breaches of country money. The result of the Board's action as regards members has been generally satisfactory; but as regards non-members, although the action taken by the Burd has in some cases tended toward improved conditions, in others it has elicited no response. No complaint of a breach by the men has been received. In these circumstanors the Board would recommend the Association and the Union to consider the possibility of bringing any pressure to bear in the case of unfair conditions being employed.

"3. The results of the Board's investigations show the desirability

in the interest of all parties of the careful observance of the Rules

both by members and non-members.
"4. The Union's representatives have on several occasions raised the question of amending certain Rules, but owing to the powers

of the Board being limited to the investigation of complaints of or the Board seing limited to the investigation of complaints of non-observance or cases of hardship where the Rules are OBSERVED, and giving interpretations of the Rules for the guidance of members, we are precluded from making any suggestions in that direction. The Board would advise that the scope of the inquiry should be extended to allow the consideration of alterations to the Rules, should such alternation be thought. DESIBABLE, and any recommendations be submitted to the Masters'
Association and the Union.

"5. The Board recommend that a Committee similarly constituted to the present one should continue to sit and to meet every

two months

Brothers Western, Webb, and Greenwell, delegates to the Joint Board, having spoken, and a number of questions having been answered, the Report was adopted.

Brother G. Butler, South-West Brauch, advocated that an application be made for an advance of wages to 11d, per hour with a

Brothers Greenwell, District Committee, and C. Collins, Central Branch, moved the following resolution, which was carried:—

That an application be made to the London Electrical Masters' Assocition for an advance of wages to is. per hour, with a 48-hour week.

Brothers Stavenhagen, West Branch, and Slark, District Committee, moved the following resolution, which was carried:—

That the delegates to the Joint Board move for the deletion of the Disability Clause and all reference to pipe-fitters and improvers from the working

Brothers Vaughan, District Committee, and Greenwell, District Committee, moved the following resolution, which was carried :-

That this meeting of London E'estrical Workers protests against the Government's decision to loan funds to local authorisies under the Housing, No. 2 Act, 1914, only when and where unemployment is acute in the building trades and a demand be made that financial help be given irrespective of trade fluctuations.

Brothers Vaughan, District Committee, and Stavenhagen, West Branch, moved the following resolution, which was carried:—

That this meeting of London members of the Electrical Trades Union calls upon the Government to take immediate action with regard to high prices of food stuffs, coal, &c., which are pressing hardly upon those whose life is already a struggle for subsistence.

Brothers Scrace, Fleet Street Branch, and Buchan, Fulham Branch, spoke to the resolution.

Brother Kinuiburgh, General Organiser, made a statement on the new rules and emphasised the necessity of strengthening the organisation

It was decided that the report of the Joint Board and the other resolutions carried by the meeting should be communicated to the technical and general Press.

It was decided to hold another general meeting of members on

Monday, March 1st, 1915.

NOTES.

Institution and Lecture Notes.—Wireless Society of London.—The Presidential Address for the current session was delivered to this Society by Mr. A. A. Campbell Swinton, in the I.E.E. Lecture Hall, on January 26th, the meeting being well attended. After announcing that it was the Committee's wish that in the present crisis he should remain in office a second year, that in the present crisis he should remain in omoe a second year, the President read a fraternal greeting from Colonel Farrié (nav, on active service) who wrote that on land and sea wireless telegraphy had fulfilled all the functions expected from it in this war, and would doubtless be yet more valuable in later stages of the campaign. A suitable reply having been framed on behalf of the Society, the President announced that the Society had furnished a number of operators complying with the very stringent requirements of the Post Office, and had besides rendered other services, ments of the Fost Omos, and had besides rendered other services, concerning which more could be said later. They would have to wait also to learn just what part wireless telegraphy had played in the present war. Using an excellent collection of apparatus, much of it of historical interest, Mr. Campbell Swinton demonstrated the fundamental phenomena of electromagnetic and electrostatic induction and high-frequency discharges. A single-phase electromagnet exemplified electromagnetic induction by lighting a lamp "wirelessly" by heating a metal ving held sound it and but to remain "wirelessly," by heating a metal ring held round it and by throwing off or "levitating" a ring not subjected to mechanical restraint. A three-phase magnet caused great amusement by the way in which its rotating field spun all manner of metallic objects, such as coins, rings and skeleton squirrel-cage rotors. Mr. Swinton exhibited slides to show the nature of condenser discharges, and using current of about 200,000 cycles per second frequency, he showed how a lamp could be lighted, though short-circuited by a few inches of copper wire, the latter being in an inductive loop. He also demonstrated electrostatic induction from loop to loop, and showed that sufficient current at this frequency could be passed through the body to light a 100-volt. 20-c.P. carbon lamp; at ordinary frequencies such a current would be fatal. By further raising the pressure, using Tesla's transformer, a variety of interesting discharges was obtained, and using current at 20,000 volts, an arc was struck and maintained between hot rods of soda glass (which is a conductor when heated). Finally, the Poulsen modification of Duddell's musical arc was exhibited, and it was shown that whereas a Tesla discharge was noisy and intermittent, the Duddell are provided a quiet and continuous discharge of very much higher frequency and much more suitable for wireless telegraphy and telephony.

Diesel Engine Users' Association.—At the last meeting of this Association, held at the Institution of Electrical Engineers, this Association, held at the Institution of Electrical Engineers, the use of Mexican fuel oil was discussed. Letters were read from several firms or undertakings who had actually used, or were using, this particular class of fuel oil, giving their experiences in the matter. An interesting report on the influence of sulphur in liquid fuels used in internal-combustion engines was referred to, and it was arranged that this should be circulated among the members of the Association. The Admiralty specification for fuel oil was also discussed, and the Committee of the Association was requested to collect further information on the subject of specifications for this class of fuel, with a view possibly of eventually pretions for this class of fuel, with a view possibly of eventually pre-paring a specification which could be used as a standard by the members of the Association.

Mr. Geoffrey Porter (of Worthing) had prepared some interesting notes on the subject of Diesel engine insurance, and, after a discussion on this subject, it was suggested that the insurance offices should be approached with a view of discussing with them the whole question of insurance against breakdowns, for which risks such a wide variation in rates obtains at the present time.

The next meeting is to be held on Friday, February 19th, at the Institution of Floating Programs, Information and Particular.

Institution of Electrical Engineers. Information and particulars concerning the Association can be obtained from the acting hon, secretary, Mr. Percy Still, at 19, Cadogan Gardens, London, S.W. At the meeting of the BIRMINGHAM LOCAL SECTION On Friday last, Prof. Andrew Gray delivered his Kelvin lecture on "Lord Kelvin's Work on Gyrostatics." There was a good attendance.

Associazione Electrotecnica Italiana.—The Association has

elected as its new president Signor Guido Semenza, formerly viceelected as its new president Signor Guido Semenza, formerly vicepresident and secretary of the International Congress and of the
Comitats Electroteonico Italiano. In a speech delivered at the
yearly meeting of the Association of Working Electrical Installations on "The Present Conditions of the Market for Electrical
Energy," the new president outlined the four chief openings which
lie immediately before the Italian electrical industry. These are
—Railway traction, agriculture, electrochemistry and electrometallurgy. Italy, in the opinion of Signor Semenza, offers a
larger scope for the development of electric traction than any other
country. The chief hindrance to its realisation is one of finance,
which may be overcome by the electrotechnical industry directly which may be overcome by the electrotechnical industry interested, who will thus contribute to create a demand, so to speak, for their own products. One gain which will result from the introduction of electricity into agriculture will consist in the the introduction of electricity into agriculture will consist in the utilisation of the surplus summer and daylight production. And while the chemical and metallurgical industries cannot pay existing prices for energy, small improvements, which will inevitably be effected, will facilitate a vast absorption of electricity, and tend to a great expansion of the electrical industry in the near future. In a more comprehensive elaboration of his views in the Elettrotecnica, the author points out that the yearly absorption in Italy of electrical energy for motive power and lighting purposes has now reached such a degree of regularity as to preclude the possibility of rapid movements, but the utilisation of the water resources has barely begun. At the moment it is somewhat at a standstill, owing to movements, but the utilisation of the water resources has barely begun. At the moment it is somewhat at a standstill, owing to the falling off of the demand for electrical energy. Hence there is need for seeking new outlets for existing surplus supplies, and for those new ones which may be profitably obtained in the future. The various services of agriculture offer, as previously stated, an outlet, as does railway electrification, which, in his opinion, although started, has not made a definite spring; house heating and domestic cooking present other outlets, but the latter is fettered by taxation difficulties. Additional arguments for the development of the electrochemical and electrometallurgical development of the electrochemical and electrometallurgical industries are found in the dearness of coal (mostly imported, and made still dearer by the war), while water-generated electricity can be produced at a cheap rate, and in the fact that many Italian native ores can only be economically treated by the electric systen

National Illumination Committee of Great Britain.— The report of the chairman was presented at a special annual meeting of the Committee on January 12th, and stated that the work done had consisted mainly in the establishment of rules and appointment of officers. The Committee has passed a resolution to the effect that it is desirable that a uniform international method be adopted for rating and marking all sources of light, with a view to the consideration of the subject at the next Session of the International Commission on Illumination. Mesers. H. G. Colman and W. Duddell have been appointed representatives of Great Britain on the Executive Committee of the Commission. The officers are as follows:—Chairman, Mr. Edward Allen; Vice-Chairmen, Messrs. W. Duddell and A. P. Trotter; secretary and treasurer, Mr. W. J. A. Butterfield, 66, Victoria Street, S.W.

Association of Mining Electrical Engineers.—At a meeting of the West of Scotland Branch at Glasgow, on January 23rd, a paper by Mr. Bowman, on "Electricity at the Coal Face," was read. Mr. Bowman maintained that electricity might be advantageously and economically used where the colliery was fairly large and old, with a number of steam-using auxiliaries, fairly large and old, with a number of steam-using auxiliaries, where the roads were long, where the seams were thin, where Special Rule 15 did not apply, and when the load factor due to pumping could be kept high. Electricity was particularly advantageous where a group of collieries could be unified under one electrification scheme. According to his own experience, electricity was a companied agreement to the most expense of the most expense applied direct would generally give the most economical results, but it might be advisable in connection with coal-cutting, from the point of view of safety and reliability, to use compressed air.

Royal Scottish Society of Arts.—Dr. J. Erskine Murray is delivering a course of lectures to the Society on "Electric Waves and the Principles of Wireless Telegraphy and Telephony."

Royal Institution.—At a general meeting on February 1st the special thanks of the members were returned to Dr. H. D. Rolleston for his gift, in the name of Miss Davy (niece of Sir Humphry Davy), of a bust of Sir Humphry Davy, executed in 1822 by Samuel Joseph.

Society of Engineers.—The new President, Mr. Norman Scorgie. was installed and read his inaugural address on Monday last. The President's gold medal was presented to Mr. A. S. E. Ackermann, for his paper on "The Utilisation of Solar Energy."

Institution of Electrical Engineers.—On Thursday last week, in London, and again at the meeting of the BIRMINGHAM LOCAL SECTION on Friday, Prof. A. Gray, LL.D., F.R.S., read the Kelvin Lecture, on "Lord Kelvin's Work on Gyrostatics." The letture was fully illustrated with experiments.

Willesden Polytechnic Electrical Engineering Society.—The thirteenth annual dinner is to be held on Saturday evening, February 6th, at Reggiori's Restaurant, Chapel Street, Elgware Road, at 7 p.m. The chairman is Mr. Frederic H. Taylor, A.M.Inst.E.E.

Educational Notes. -- CITY AND GUILDS (ENGIN-EEBING) COLLEGE, Exhibition Road, S.W.—The following special advanced courses have been arranged for the Electrical Engineering

Department:—
"Design of Alternating-Current Turbo-Generatora," by Prof. Miles Walker, on Wednesdays, February 10th to June 2nd, at

"Design, Manufacture and Uses of Transformers," by Mr. A. P. M. Fleming, on Thursdays, March 4th to June 17th, at 4.5 p.m. See also our advertisement pages to-day for further particulars.

Rate of Pay for Armature Winders .--The Cour of Arbitration of the Board of Trade has determined that the rate of wage of the armature winders in the L.C.C. tramways department shall be increased from 10d, to 10½d, per hour as from January 1st. The Court, in making their award, desire to express that werent that as recorded in the minimum of the marking of the market. their regret that, as recorded in the minutes of the meeting of the Rolling Stock Conciliation Board, held on November 26th, 1914, representatives of the men should have stated that, in the event of an increase of the rate of wages not being granted, the employés had determined to slow down to such an extent as to make the L.C.C. pay the same amount for work done, as it would pay if the present rate were increased.

Parliamentary.—Standing Orders.—All the Private Bills have now been before the Examiners for proof of compliance with Standing Orders. The consideration of several has been postponed, whilst in the case of the Halifax Corporation Bill non-compliance has been found, owing to the promoters having failed to secure the consent of the road anthorities in regard to several lengths of tramways proposed outside the borough. The Bill will now go before the Standing Orders Committee, who will decide whether it shall proceed. decide whether it shall proceed.

South Shields Bill.—A poll has been taken of the ratepayers in regard to the South Shields Corporation Bill, which was defeated at a town's meeting. A majority decided in favour of proceeding with the Bill.

Doncaster Corporation Bill.—At the town's meeting called some time ago to consider the Bill of the Corporation, Clause 129, which provides that the Corporation may, in connection with its electricity undertaking, sell, let for hire, and fix, repair and remova, but shall not manufacture, lamps, meters, electric lines, fuses, switches, lampholders, motors and other electric fittings, was defeated. The Corporation has since taken a poll, and the clause was again defeated.

Germany's Copper Famine.—A correspondent of the Daily Telegraph in Rotterdam quotes an article in the German technical journal, Die Metallborse, on the subject of the copper supply, as follows:—"We can get a good deal of copper from the territories of our enemies now in our occupation. Other sources of supply are kitchen utensils and the cables of electric railways and tramways, some of which are not now running, such as that between Halle and Bitterfeld. Copper can be taken also from the tramways and telephones in Belgium. The material from these sources could be used almost immediately. We have sufficient copper for quite a long time." Germany's Copper Famine.—A correspondent of the

Russia.—The Consul-General for Russia (30, Bedford Square, W.C.) is willing to receive inquiries from British firms respecting a manufacturer's agent who is now in this country from Russia. The said agent already represents several British firms there, and he wishes to secure further representations for aluminium, brass, brass wire, rubber thread, electric lamps, and fittings, &c.

Catalogues Wanted for Australia.—A merchants and agents in Sydney wants catalogues and price lists of British arc-lamp carbons, metal conduits, and electrical accessories. These should be addressed to H.M. Trade Commissioner for Australia, 81, Pitt Street, Sydney, N.S.W.

Loaded Submarine Cables.—The German Patent No. 210,151 (British Patent No. 5,547, 1907). "Improvements relating to electric cables containing induction coils," has been before the German Patent Court at the instance of a well-known firm of submarine cable manufacturers who demanded its revocation on the ground of anticipations, but the decision was that these were not substantiated, and the patent was upheld in all its claims.

Fatality. - A Cambuslang miner, who was injured while working an electric coal cutting machine in Gilbertfield Colliery, has died in the infirmary.

Patents and Alien Enemies,—Messrs. H. R. Witting and Partners have been granted a licence by the Board of Trade in respect of Patent No. 9,845 of 1911, owned by Mesars. K. & Th Möller, G.m.b.H.

Electro-Harmonic Society.—The next concert (Ladies Electro-Harmonic Society.—The next concert (Ladies Night) will be held at the Holborn Restaurant (King's Hall), on Monday evening, February 8th, at 8 o'clock, Capt. H. Riall Sankey, R.E. (ret.), M.Inst.C.E., will preside. The preliminary programme is as follows:—Miss Caroline Hatchard (soprano) Miss Dorotby Webster (contraito); duettiste, Miss Mabel Braine and Miss Jessie Reeve (in their delightful musical ensemble) Mr. Anderson Nicol (tenor); Mr. Heath Francis (baritone); Miss Eith Abraham (violin); Mr. Arthur Thomas (humorous entertainer); Mr. George Bolton (entertainer at the piano); solo pianoforte and accompanist, Mr. Bernard Flanders, A.R.A.M.

A Conduit Tramway Effect.—A correspondent, writing to the Standard recently, described a curious phenomenon on the Brixton Hill conduit tramway which occurred at the time of the recent snowstorm. Power had been cut off early in the afternoon, leaving the cars standing; apparently about 7 p.m. current was again switched on, and a brilliant light was observed,

which seemed to be travelling down the hill.

The correspondent continued:—"The most probable explanation is that the snow and slush, together with the salt thrown down on the roads, collected in the tramway conduit and made a partial connection between the live rails under the roadway, the travelling of the flashes being due to the fact that as soon as a flash occurred at any point the heat dried the water out at that point, which would cause fisshing to continue at the next wet

"The interest in the occurrence, to an electrical mind, consists in the fact that the flashing continued for such a considerable time before the current was sufficiently great automatically to switch off the power at the supply station. This actually occurred after a few minutes, but I venture to say that the actual conditions which caused the display might not occur once in a handed similar cause." hundred similar cases.

Inquiries.—The Hydro-Electric Power Commission of Ontario (engineering department), whose headquarters are at Continental Life Building, Toronto, wishes to get into touch with British firms who have developed special systems of wiring, and who carry materials for standard house wiring in stock, as it is its intention to investigate thoroughly the merits and demerits of various standardised European methods. The Commission has in mind bare concentric wiring using a single central conductor, with mind bare concentric wiring using a single central conductor, with a bare metallic sheathing forming an outer earthed conductor, metal-sheathed wires in which two conductors are enclosed in a light, but fairly strong, metallic sheathing, and the various weights of lighter steel conduits. Its chief concern at present is to look into methods which will cheapen the cost of wiring, and so bring electricity within reach of a larger number of people.

Makers of small house service meters, for 3 to 18 16-watt lamps, are asked for.

The Electrification of Hens. — The rapid growth of chickens subjected to high-frequency treatment has been demonstrated in this country (see Electrical Review, December 19th, 1913). Now Mr. G. C. Newell, of Chicago, a Welshman by birth, who keeps 150 hens in his back garden, states (says the Daily Call) that last year he obtained from them 18 000 eggs. He found that they did not lay much in from them 18 000 eggs. He found that they did not lay much in winter, as they went to roost earlier and got up later, so he installed electric light in their quarters, connected with switches in the house. He says: "At six in the morning I turn on the switch, and the fowls get up, thinking it is daylight. The lights are turned off at daylight, when the neighbours' fowls are just arising. At 4.0 the lights are turned on again, and they are kept going until 9.0 at night, when I turn all out except the 2-C.P. lamps. These give just sufficient light to give the appearance of dusk, and the fowls begin going to roost. I leave the small lamps lit all night, so that if any of the fowls want to get up at night to lit all night, so that if any of the fowls want to get up at night to

eat they can do so.
"Eleven days after the lights were installed the daily average jumped from 26 eggs to 83. During the moulting season under the old custom, when most of the food was going to feathers instead of eggs, I had only 11 eggs a day. Now I get 52 a day during the moulting season. By my method I keep the chickens thinking they are getting the same amount of daylight all the year round, and I am keeping them thinking all the time."

This sounds very satisfactory in a way, but it looks uncommonly like sweating the poor hens. In this country it would be impracticable, owing to the vigilance of the Trade Unions.

Municipal Authorities and Coal Supplies.—A correspondent says that great interest is being manifested in Lancashire and Yorkshire coal trade circles in the conference to be held to-day (Friday) in Manchester, convened by the Manchester and Salford Corporations to discuss the threatened coal famine, and to secure, if possible, the suspension of the Mines Eight Hours Act. Over a score of Lancashire and Yorkshire Corporations will be represented at the conference. Iaquiries made amongst miners in various parts of South and South-East Lancashire coalfields go to show that any attempt to set aside the Eight Hours Act, even temporarily, will be strongly resented by the bulk of Trade Union miners, who contend that there is no fear of a coal famine occurring for the present, at any rate. Numbers of pits, they say, work only five days per week. Municipal Authorities and Coal Supplies.

Appointments Vacant.—Charge engineer (30s.), for St. Albans Electricity Works; switchboard attendant (27s.), for Morecambe Corporation electricity department. Particulars are given in our advertisement pages.

Water Seftening by Electrochemical Methods.—
Among the papers prepared for the meeting of the American Society of B. frigerating Engineer- held recently in New York City was one by Mr. C. P. Landreth, of Philadelphia, calling attention to the fact that electricity will hasten chemical reaction and thereby improve the results obtained with boiler-feed-water softening compounds. To soften water it is analyzed in the usual way and the chemical compound determined which will precipitate the scale-forming compounds present in the water. For instance, calcium hydroxide is used to remove calcium bicarbonate, instance, calcium hydroxide is used to remove calcium bicarbonate, sodium carbonate is employed to remove calcium sulphate, &c. After the softening compound has been added to the boiler-feed water, it is circulated past parallel electrodes which are placed close together in order that as much of the water as possible may be brought in contact with the surface of the plates. Because of its ionising property-electricity will separate the compounds into their components, thereby hastening the recombination to form precipitates, which coagulate and are removed without difficulty.

Unaided by the addition of any energy, the reaction between calcium sulphate and sodium carbonate to form insoluble calcium carbonate and soluble sodium sulphate is ordinarily very slow, but if electricity be allowed to ionise the water containing these compounds the precipitate can be quickly removed. In a plant mentioned by the author of this paper, the calcium carbonate in solution was reduced to 3 grains per gallon, which is within 1/160,000 of the theoretical amount which would be held in solution, the electrolysis producing sufficient coagulation, so that the precipitate could be readily removed in filters. Ten million gallons of water per day was treated in this manner with a continuous power r quirement of only 480 watts per 1,000,000 gallons.

— Electrical World.

OUR PERSONAL COLUMN.

The Fditors invite electrical engineers, whether connected with the technical or the commercial side of the profession and industry, also electric tramway and railway officials, to keep readers of the ELECTRICAL BEVIEW posted as to their movements.

Central Station Officials.—The Eccles Town Council is asked to confirm the appointment of Mr. H. Short, of Salford, as switchboard attendant, in the place of Mr. Glithere, resigned. LANCE-COEPORAL MULLINEE, the assistant electrical engineer, has been offered a commission as Second Lieutenant.

The Poplar Borough Council has been recommended to grant

The Poplar Borough Council has been recommended to grant the following increases in the salaries of members of the staff of the electricity department:—MR. F. TAIT, assistant manager, £262 10s. to £275 per annum; MR. V. H. CRUICK-SHANK, station engineer, £237 10s. to £250; MR. E. R. INGRAM, mains engineer, £237 10s. to £250; MR. C. E. FARRANCE, sales manager, £225 to £237 10s.; MR. C. A. O'NEAL, assistant sales manager, £175 to £185; MR. A. H. VINCENT, junior clerk, £65 to £71 10s.; MR. P. C. G. WESTLAKE, charge engineer, £175 to £185: to £185; MR. W. E. Plowman, charge engineer. £175 to £185; MR. J. Forsyth, £162 10s. to £175; MR. C. W. Coppinger, charge engineer, £150 to £162 10s.; MR. A. E. Ricketts,

sub-station engineer, £150 to £162 10s.

The Bermondsey Electricity Committee has received applications from the employed of the department for increases in salary, but has decided not to take any aution in regard thereto, except in the

has decided not to take any action in regard thereto, except in the case of Mr. J. W. Pendrey, mains foreman, who at present receives 60s. a week. In this case, the Committee recommends that Mr. Pendrey should be given a gratuity of £10, having regard to the extra amount of work he is called upon to perform while the mains superintendent is with the Forces.

Ms. J. C. Williams, deputy borough electrical engineer and tramways manager at Rotherham, has been appointed electrical engineer to the Erith U.D.C., at a salary of £350 a year. Mr. A. Coveney, his predecessor, will continue to act until Mr. Williams arrives, at a remuneration to be fixed.

MR. Emerson. late assistant engineer of the Galway Electrical

MR EMERSON, late assistant engineer of the Galway Electric Lighting Co., has been presented with a gold watch by the st..ff

Lighting Co., has been presented with a gold watch by the st..ff on leaving for St. Albans.

We are informed that Mr. W. A. Brown has resigned his appointment as distributing engineer to the St. Pancras Borough Council, after over 17 years' service, to take up a position with the Pirelli-General Cable Co., of Southampton, as manager of the underground cables sales department, and that he will be located at headquarters, 141, Queen Victoria Street, E.C., after the 1st prox.

The Keighley T.C. has decided, by 15 votes to 6 to advance the salery of the borough electrical engineer, Mr. H. Werber, from £325 to £400. Mr. Webber has a separate salary of £100 as tramways manager.

General.—Mr. A. S. Mann has resigned his position with the L.C.C. tramwsys, and has accepted a position as examiner in the drawing office, on the staff of Messrs. C. A. Vandervell and Co., of Acton.

A South African contemporary states that MR. E. G. Izon has succeeded Mr. J. H. Rider as head of the engineering staff of the Central Mining-Rand Mines group.

MB. ABTHUR J. CRIDGE has accepted a position with the British Westinghouse Electric and Manufacturing Co., Ltd. Since April, 1911, he has controlled the meter department of the Electrical Co., Ltd., but his new cuties are connected with the sale of transformers. He will be at Trafford Park for some time in order to familiarise himself with the company's manufactures in this

direction.

MR. FRANK DUDLEY DOCKER has been elected to a seat on the board of the Metropolitan Railway Co., rendered vacant by the retirement of the Hon. Francis McLaren, M.P., who has accepted a commission in His Majesty's Forces.

MR. JOSEPH TIERNEY, College Green, Dablin, has been elected

consulting electrical engineer to University, College, Dublin.

Obituary.—MR. T. H. Wells.—A link of unusual interest in the telegraph world has been severed by the death of MR. Thomas Henry Wells, the late secretary of the Anglo-American Telegraph Co., Lti. He entered the Electric and International Telegraph Co. (Incorporated 1846) in 1847, and when that company was taken over by the Post Office he joined the first Atlantic Cable Co., serving successively as traffic accountant, accountant and secretary, retiring in 1912 when the Anglo-American Co. was leased to the Western Union Telegraph Co., of American Co. was thus identified with American cable companies He was thus identified with American cable companies America. He was thus identified with American cable companies from their infancy, and was for 65 years a sociated with telegraphy. Such long service is, we believe, a record. The advance in the graphy, the ups and downs of cable companies, and the fight for control of Atlantic traffic during his secretaryship of 32 years of the Anglo-American Telegraph Co., brought him into very close acquaintenceship with Jay Gould, Cyrus Field, Bennett Mackay, the Marquis of Tweedale, Sir John Pender, J. S. Morgan, and many other prominent men, who have long since passed away. His knowledge of the history and working conditions of cable companies was profound and unique. A telegraph form of 1857 reminds us of the fact that in that year there were only four offices to take messages in Manchester, and three offices in Leeds and Liverpool. No message was delivered beyond half-a-mile without porterage, and no charge was made beyond half-a-mile without porterage, and no charge was made for names and addresses of either sender or receiver. A wag who had arranged to advise his friends in London of his safe arrival in had arranged to advise his friends in London of his safe arrival in Liverpool by tendering a form containing only his name and that of the addressee, found, however, he could not announce his safe arrival in that way for nothing. In 1866 there were only 340 telegraph stations in Great Britain and Ireland. Mr. Wells initiated and organised the stores department of the Electric and International Co., travelling periodically over the whole country in the late fifties. He was an elocutionist of quite exceptional power and used his remarkable gift freely in the interest of many and various charities. Annually for a long period an evening of "Readings and Recitations" was given by him on behalf of the Post Office Orphans' Home at St. Jam's's Hall (Large Hall), London, when he appeared appeared before crowded audiences under the name of "Herbert Walton." In 1871 at the instance of Florence Nightingale he gave an entire evening at the same hall in aid of the Distressed French Peasantry. Charles Dickens attended on several occasions, and considered Mr. Wells's powerful renderings of his works were the finest studies and presentations of the scenes and characters of and considered Mr. Wella's powerful renderings of his works were the finest studies and presentations of the scenes and characters of his books, notably the 'Death of Quilp' scene. At the time of his decease Mr. Wells was still a director of the House Property and Investment Co., and vice-chairman of the British Equitable Assurance Co. He was a man with extraordinarily good health, absence from City circles for more than a day being a rare occurrence. A very brief illness preceded his death at 81 years of age. He was a widower for 17 years, and leaves a family of two sons and three daughters. and three daughters.

MR. W. EDGAR ALLEN.--We regret to learn of the death, which occurred on January 28th, of Mr. William Edgar Allen, who, as long ago as 1868, founded the firm of Edgar Allen & Co., steel manufacturers, Sheffield. Ia 1890 he turned the business into a imited company. Mr. Allen was a man of great enterprise, and he succeeded in building up business connections in all parts of the world, his linguistic attainments and commercial training assisting him greatly in endeavours to this end. He travelled in all parts of the world in the interests of his firm, which now has an annual wage-bill of about £200,000.

MB. R. O RITCHIE—The death occurred at Tollgates, Battle, Sussex, on January 29th, of Mr. Robert Ord Ritchia, electrical engineer. Deceased, who passed away suddenly from heart failure, at the age of 57 years, had resided at Battle since 19 8. He was a brother of the late Lord Ritchie, of Dundee, was a member of the Institution of Electrical Engineers, and was associated with the construction of electric tramways at Rome, Leeds, Huddersfield, and elsewhere. At Battle he had served on the Urban Council.

NEW COMPANIES REGISTERED.

Electric Lamp Factors, Ltd. (139,131).—This company was registered on January 27th, with a capital of £6,000 in £1 shares 15,000 pref.), to carry on the business of agents for, factors of and dealers in electric glow lamps or other lamps of any description, lighted by electricity, and any apparatus and appliance connected with the consumption and supply of electricity, etc. The subscribers (with one preference share each) are: M. H. Robinson, Struan, Fassett Road, Kingston-on-Thames, engineer; L. I. Robinson, Struple Inn, W.C., electrical engineer. Private company. The number of directors is not to be less than two or more than five; the first are M. II Robinson and L. I. Robinson. Solicitors: Farrer, Porter & Co., 2, Wardrobe Place, Doctors Commons, E.C.

Elieson Electric Traction Co., Ltd. (139,120).—This company was registered on January 26th, with a capital of £1,000 in £1 shares, to acquire and turn to account any invention relating to the production, treatment, storage, application, distribution and use of electricity; to carry on business as motor car, landaulette, cab, omnibus and van proprietors, manufacturers of motors, motor vehicles, ships, boats, motor boats, launches, flying machines, submarines, etc. The subscribers (with one share each) are: C. P. Elieson, 24, St Mary Abbots Terrace, Kensington, W., electrical engineer; F. Mariaux, 66, Frith Street, Soho, W.C., director; L. E. Porel d'Angond, 28, Buer Road, Fulham, S.W., motor traction engineer. Private company. The first directors (to number not less than two or more than five) are C. P. Elieson, F. Mariaux and L. E. Porel d'Angond (life directors). Qualification, one share. Solicitors: Canwarden & Co., Gloucester Mansions, Cambridge Circus, W.C.

Sperry Gyroscope Co., Ltd. (139,126).—This company was registered on Jan. 26th with a capital of £2,000 in £1 shares, to carry on the business of manufacturers, importers and exporters of and dealers in gyroscopes and gyroscopical appliances and devices for steadying ships, boats, submarines, aeroplanes and all kinds of airships, mono-rail and other cars, carriages, wagons and vehicles, manufacturers of and dealers in electrical supplies, mechanical and electrical engineers, etc., and to adopt an agreement with the Sperry Gyroscope Co., of Manhattan Bridge, Plaza and Flatbush Avenue, New York City. The subscribers (with one share each) are: R. E. Gillmor, 57. Victoria Street, S.W., engineer; T. A. Morgan, 57. Victoria Street, S.W., engineer; Private company. The number of directors is not to be less than three or more than nine; the first are E. A. Sperry, R. E. Gillmor, and T. A. Morgan. Solicitors: Hasties, 65, Lincoln's Inn Fields, W.C. Secretary, H. S. Jones.

A. Robinson & Co., Ltd. (139,142).—This company was registered on January 28th with a capital of £15,000 in £1 shares (7,000 pref.), to take over the business of mechanical and electrical engineers, founders, smiths, manufacturers and patenties of ships' telegraphs, nautical instruments and all kinds of signalling, indicating and recording instruments and appliances carried on at 3 and 3a, Knowsley Road, Bootle, Lancs., as "A. Robinson & Co.," and to adopt an agreement with P. R. Keppie. The subscribers (with one share each) are: P. R. Keppie, 3, Knowsley Road, Bootle, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 47, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs., engineer; E. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs, engineer; A. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs, engineer; E. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs, engineer; E. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs, engineer; A. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs, engineer; A. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs, engineer; A. A. Lambert, 48, Alexandra Road, Great Crosby, Lancs, engineer; A. A. Lambert, 48, Alexandra Road, B. A. Lambert, 48

OFFICIAL RETURNS OF ELECTRICAL COMPANIES.

Thomas Kesnor & Co., Ltd.—A memorandum of satisfaction in full on December 30th, 1914, of mortgage dated December 29th, 1911, securing £250, has been filed.

Drake & Gorham, Ltd. (70,275).—Capital, £125,000 in £1 shares. Return dated October 22nd, 1914. All shares taken up; £85,000 paid; £40,000 considered as paid. Mortgages and charges: Nil.

Monte Video Telephone Co., Ltd. (27,208).—Capital, £160,000 in £1 shares 187,000 pref.). Return dated November 5th, 1914. 86,492 pref. and 72,680 ord. shares taken up. £159,172 considered as paid. Mortgages and charges: Nil.

East India Tramways Co., Ltd. (74,457).—Capital, £100,000 in £1 shares (15,000 pref., 35,000 ord., and 50,000 defd.). Return dated December 14th, 1914. 7,476 pref., 33,433 ord., and 50,000 defd shares taken up. £1 per share called up on 7,476 pref. and 7 ord. shares; £7,489 paid (including £6 paid on 24 pref. shares forfeited); £83,426 considered as paid on 33,426 ord and 50,000 defd. shares. Mortgages and charges: Nil.

CITY NOTES.

Yorkshire (West Riding) Electric Tramways Co., Ltd.

SIR HERBERT S. LEON presided on January 22nd at the tenth ordinary general meeting, held at 31, Throgmorton Street, E.C. In proposing the adoption of the report, he said that the proposition to any that unbetween a said that the proposition to any that unbetween any that the proposition to any the prop he was not in a position to say that substantial progress had been made by the undertaking during the year. Still, the results were very much better than the most sanguine sharebeen made by the undertaking during the year. Still, the results were very much better than the most sanguine shareholder had a right to expect considering the many adverse curcunstances which the war had brought about, for the receipts were actually £81 in excess of the previous year. In 1912 they had what they then regarded as a boom year, and the traffics were up nearly £7,000. Up to the end of July, before the war commenced, they had beaten their previous record and were £1,261 to the good, and there seemed every likelihood of increased traffics during the remainder of the year. Then came the catastrophe of the war and they, like other framways, suffered considerably, particularly during the earlier stages. He was, however, pleased to say that public confidence was speedily restored and their income, although varying from week to week, became on the average equal to the previous year. That was a remarkable achievement and demonstrated that the business they had made was solid and reliable and would be affected as little as any similar businesses through the war. The gross income was £74,110, which included for the first time an item of £275. Pontefract electric lighting. He stated last year that they had purchased the provisional order for lighting the town of Pontefract. They completed the installation of the necessary plant and commenced to supply in July. There had been little business since, as many of the prospective customers had deferred the wiring of their houses and business premises until more settled times. It always took some years to establish and bring to a paying basis an electric undertaking, and with that in their minds they arranged to purchase current in bulk for five years, and they hoped during that period to build up the business without incurring any serious loss of interest. The capital involved was about £12,000. It was yet too early to express any definite opinion, but he thought this would prove to be a nice paying little property yielding a satisfactory return in a few years time when things had again become normal. To return to the tramway undertaking, on a car mileage basis they had taken 10,001d. per car mile as against 9,980d, last year, an increase of 0.063d. That did not seem much, nor could it convey much to their minds, but trainways and light railways were worked on small margins, and every small increase of profit multiplied by the car mile unit meant a considerable gross sum. The tramway revenue had grown steadily but surely. In 1905 the receipts were £83,615, and the working expenses £19,633 [asving a balance of £18,685, whereas last year the receipts were £74,110 and the expenses £2,401. leaving a blance of £18,685, whereas last year the receipts were £74,110 and the expenses £2,401. leaving a blance of £18,685, whereas last year were less by £937 than those of the previous year, which was very satisfactory seeing that they were paying higher wages and higher prices for practically everything they bought. Fuel had cost them more, but they had made a big saving of £1,696 in the upkeep of the permanent way as a result of their expenditure upon paving. From the day they commenced running the tramways-they had improved them in every possible way, and to-day he thought their property was worth very much more than it was originally. They had spent considerable sums in renewals last year from the depreciation and renewals fund account in order to improve the undertaking, and or necessarily because the parts replaced were worn out. The big item in that account—£3,086—was due to the substitution of granite setts for York stone setts in Normanton and Castle-ford. They would have to face considerable further expenditure in a similar way where York in bulk for five years, and they hoped during that period to build up the business without incurring any serious loss of interest. The capital involved was about £12,000. It was yet

mation.

Mr. Ernest Remnant seconded the motion and the report was adopted.

Delabole Electric Lighting and Supply Co., Ltd.

Delabole Electric Lighting and Supply Co., Ltd.

An adjourned meeting of shareholders was held on January 18th at Delabole, Mr. M. Wells presiding.

Mr. F. C. Haughton (acting for the Secretary, his son, who is with the Colours) presented the second statutory report.

The Chairman pointed out that the report covered only six months and was quite satisfactory. An extra cable was needed as far as the head of the village, so that the consumers at Rookhead and Medrose might have better light. He was pleased to say that the work had been verified by an expert as a most satisfactory and effective installation.

Mr. Haughton congratulated the shareholders on the report. No dividend was declared, it being desirable to place the company on a good financial basis. He did not consider the price too high. Of course, as a shareholder he wanted dividends; but, as a consumer, he would like the light cheap.

The Chairman, in reply to observations, said the directors were entering into certain negotiations by which capital would be raised, and with another £200 they would be able to present a clean sheet.

The report was adonted.

sent a clean sheet.

The report was adopted. At the instance of Mr. Stacey the Old Delabole Slate Co. were thanked for freely providing the motive power.

Llandudno and Colwyn Bay Electric Railway, Ltd.

Mr. A. W. Tair presided on Jan. 22nd, at Basildon House, E.C., over the annual meeting. In moving the adoption of the report, he said that the profit for the year, after providing for operating and administration expenses, and interest on debenture stock, amounted to £5,144, as compared with £7,764 for 1913. The traffic receipts amounted to £15,672, a decrease of £2,039, which was entirely due to the interruption of the holiday season by the war. The outbreak of the war at the busiest period of the company's year was exceedingly unfortunate, as at the end of July, notwithstanding interruptions to the service in the earlier part of the year in consequence of doubling work, the figures showed a slight increase on those for the previous year. He was glad to state that since the close of the financial year they were able to record an increase in the earnings as compared with the same period last year, which was, to a certain extent, due to the presence of troops for training purposes in both Llandudno and Colwyn Bay. It was, of course, difficult to estimate to what extent the summer traffic of 1915 would be affected by the war, but it was reasonable to assume that it would not be so severe as that experienced last year. Miscellaneous receipts showed a slight decrease as compared with the previous year. On the debit side of the profit and loss account there was an increase of approximation. MR. A. W. Tair presided on Jan. 22nd, at Basildon House, E.C., debit side of the profit and loss account there was an increase of approximately £130 in the amount charged for power expenses. This was due to the fact that, in the early part of the year, track doubling operations were in progress which handicapped the working of the system to a certain extent, and, owing to the frequent stopping and starting of the cars, caused an increase in the number of units used. Other heads of expenditure showed decreases as compared with the corresponding figures last year, the decrease amounting to approximately £200 in respect of the item "general expenses." "Repairs and maintenance" would probably have also shown a decrease but for the fact that some exceptional expenditure was incurred upon maintenance of cars which had been put in thoroughly good order. The amount charged in respect of interest on debenture stock was somewhat larger this year, interest on debenture stock was somewhat larger this year, owing to the increased amount of stock issued to meet capital requirements. The track was doubled during the year from the end of Mostyn Avenue to St. John's Chapel, Llandudno (approximately 1½ miles). The benefits had already been felt, and would be still more appreciated during the busy seasons of the year. The doubling of the track was now complete practically from the centre of Llandudno to the outskirts of Colwyn Bay. This had enabled the company to facilitate considerably the traffic arrangements, and it would also assist them in more effectually combatting the connectition which Colwyn Bay. This had enabled the company to facilitate considerably the traffic arrangements, and it would also assist them in more effectually combatting the competition which they had to face in the shape of motor 'buses. Turning to the balance sheet, they had expended during the year approximately £18,250 on additions of a capital nature, which consisted mainly of the cost of doubling the track and of expenditure in connection with the extension to Old Colwyn. The construction of this extension was now being carried out, and would be completed in a few weeks' time. The district of Old Colwyn was growing rapidly, and there was a fairly large settled population, so they had every reason to hope that this extension would prove remunerative not only in summer, but the whole year round. Owing to the present financial position created by the war they had been unable to place the balance of the debenture stock, but arrangements had been made with the company's bankers for a loan against the security of the said stock to complete the extension. It was only intended to carry out for the present such work as was necessary to open the line for traffic. They had also decided not to order any additional rolling stock for the moment, although the requirements of the system, having regard to the added length of line, would necessitate an addition to the rolling stock to cope adequately with the summer reason traffic. They had also exceeded in obtaining the conservation to the rolling stock to cope adequately with the summer. regard to the added length of line, would necessitate an addition to the rolling stock to cope adequately with the summer season traffic. They had also succeeded in obtaining the consent of the Board of Trade to the use of trailer cars, which would also assist them in dealing with rush traffic in the summer season. The balance available for distribution, after providing debenture interest and sinking fund, was £4.538, which it was proposed to apply as follows:—A dividend at the rate of 4 per cent. per annum (payable less income tax), which would absorb £3.976, and to be carried forward £562. The sinking fund instalments referred to were, in their opinion, sufficient to meet the depreciation of the system, and they had, therefore, not made any charge under the heading they had, therefore, not made any charge under the heading of "depreciation." The reserve account stood at £4,000, as before. He thought the shareholders would agree that the net result for the year might be considered satisfactory, and their thanks were due to the manager and staff at Llandudno.

Mr. T. Stoker seconded the motion, which was carried.

German Electrical Companies.

The A.G. Carbidwerk Lechbruck, whose carbide plant is leased to the Bosnian (Jaice) Electricity Co., of Vienna, records net profits, after allowing for depreciation, of £3,600 for 1913-14 as contrasted with £1,900 in the preceding year. It is proposed to pay a dividend for the first time, namely 33 per cent.

The Suddeutsche Telephonapparate, Kabel und Drahtwerke, of Nuremberg, whose share capital of £50,000 is held by the Felten & Guilleaume Co., report net profits of £173, after

Felten & Guilleaume Co., report net profits of £173, after having placed £4,400 to depreciation in 1913-14 as compared with £5,300 in the preceding year. The balance has been carried forward; no profits were earned in 1912-13.

The Bergmann Elektrizitats Unternehmungen, of Berlin—the financial enterprise of the Bergmann Electricity Co., which decided some time ago to limit the former's activity to the conclusion of operations then on hand—reports gross profits of £15,000 for 1913-14, as compared with £6,800 in the previous year. As net profits the accounts show the sum of £9,500 as against £4,000 and the debit balance consequently becomes reduced to £27,000 on a paid-up share capital of £300.000.

The Deutsche Sudsee Ges für Drahtlose Telegraphie, of Berlin, which was jointly formed by the German Netherlands Telegraph Co. and the Berlin Wireless Telegraph Co. about Telegraph Co. and the Berlin Wireless Telegraph Co. about two years ago to work a twenty years' concession for wireless telegraphy at Yap, Raboul and Apia, reports receipts of £12,000 for the year ended on June 30th, 1914. After meeting general expenses, depreciation, etc., the accounts indicate net profits of £2,800 on a share capital of £65,000. The loss incurred in the previous year has been extinguished, leaving £2,100 to be carried forward.

The gross profits of the Wotan Werke A.G., of Leipsig, are returned at £18,500 for 1913-14, as compared with £21,900 in the preceding year. The defrayal of general expenses and the appropriation of £1,900 for depreciation, as contrasted with £2,700 in 1912-13, leaves net profits of £8,100 as against £10,000. As a result of the war the directors state that the inland debts owing had been entered at specially low amounts,

inland debts owing had been entered at specially low amounts, whilst the debts due from hostile countries had been entirely

whilst the debts due from hostile countries had been entirely written off, although a large loss on them was not apprehended. The dividend recommended is at the rate of 15 per cent., this comparing with 20 per cent. in 1912-13.

The report of the Elektro-Osmose A.G., of Berlin and Frankfort-on-Main, which was formed in 1913 with a share capital of £150,000, states that the year 1913-14 was mainly devoted to developing the internal organisation, and the continuation of scientific appearances which resulted in relatively high of scientific experiments, which resulted in relatively high expenditure in Germany and abroad. As a consequence, the year closed with a loss of £29,000, but actual working operations are expected to begin gradually in the current financial year. The commencement of regular work at the china clay washery at Chodau, near Carlsbad, where work is to be undertaken according to the company's process, is to start next month. It has been decided to increase the share capital to \$\frac{1450}{2450} \text{ for month} \text{ of the company} \text{ increase} \text{ to company} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ of the company} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month} \text{ in the capital to \$\frac{1450}{2450} \text{ for month in the capital £450,000.

month. It has been decided to increase the share capital to £450,000.

The report for 1913-14 of the Fabrik Isolierter Drähte (late Vogel), of Berlin, states that the turnover in August and September experienced a considerable reduction as compared with the equivalent months in 1913 in consequence of the outbreak of the war. Including receipts from investments the gross profits amounted to £53,000, as against £52,000, and after setting aside £6,300 for depreciation, as contrasted with £7,000, and defraying general expenses, there remain net profits of £32,000 as compared with £31,000. The directors, who recommend the payment of a dividend of 13 per cent., as in 1912-13, add that the volume of business in the first three months of the new financial year shows a falling off owing to the entire cessation of the export trade.

The Ges. für Stickstoffdunger, of Knapsack, reports gross profits, which were realised almost entirely from manufacturing, amounting to £59,000 in the twelve months ended with June 30th, 1914, as compared with £57,000 in the previous year. After allocating £22,800 to depreciation, as against £22,600 in 1912-13, the accounts show net profits and balance forward of £25,000 as contrasted with £23,000, and a dividend of 6 per cent, is in contemplation, as compared with 8 per cent.

forward of £25,000 as contrasted with £23,000, and a dividend of 6 per cent, is in contemplation, as compared with 8 per cent. in 1912-13. The report states that the trade was subject to great fluctuations during the year in consequence of the considerable augmentation in the inland production and exceptional deliveries of foreign artificial and natural fertilisers and the rise in the prices of raw materials and of labour. Since the close of the financial year the slightly increased stocks had been cleared, and all departments were now in full operation although much higher working expenses had to be reckoned with during the war. On the other hand the war had opened new scope of activity for the nitrogen industry which would possibly lead to a large extension of the plant.

Chatham and District Light Railways Co.

THE directors' report for the half-year ended December 31st, 1914, states that the revenue was £27,503, and the expenses were £14,277, leaving £13,226; less rent of Rochester Corporation lines, £1,872; interest on debentures, £881; interest account, £525; leaving £9 949, plus £2 768 brought forward. £6,000 has been transferred to reserve for depreciation; £2 940 to preference divitransferred to reserve for depreciation; £2,940 to preference dividend at the rate of 5 per cent. per annum; £2,650 to dividend at the rate of 5 per cent. per annum for the half-year on the ordinary share capital; £1,127 to revenue new account. The revenue shows an increase of £1,623, and the expenses an increase of £162, as compared with the revenue and expenses for the corresponding half-year of 1913. Three additional cars were purchased and put into service in August last. A large number of the employés have joined the colours since the outbreak of the war, and allowances are being made to the wives and dependents, involving a charge in the half-year's accounts of £390. During the half-year £4,000 debentures of the company have been purchased and redeemed.

Electrical and Industrial Investment Co., Ltd.

THE directors' report for the year ended December 31st, 1914. states that the revenue account shows a profit, after payment of states that the revenue account shows a profit, after payment of all management expenses and interest on debenture stocks, of £13,694 plus £7,282 brought forward, making a total available of £20,976. The directors recommend the payment of the dividend for the year on the 6 per cent, cumulative preference shares amounting to £6,000, and a dividend at the rate of 6 per cent, per annum on the 7 per cent, preferred ordinary shares for the period from March 26th, 1914, to December 31st, 1914, amounting to £4,599, carrying forward £10 377. The directors have continued to act on the principle of adding to reserve the profits made on sales of investments, and of charging losses on realisation against tinued to act on the principle of adding to reserve the profits made on sales of investments, and of charging losses on realisation against the reserve. The balance at the credit of reserve account is £28,298. The company holds 233 investments of the total book value of £676,928. Owing to the closing of the Stook Exchanges there were no market quotations for these investments at that date. The directors will, at a later date, when the position is better defined, make a special report to the shareholders in regard to depreciation of the investments.

The following table shows the classification of the investments according to the denomination of the securities:—

Mexican Light and Power Co., Ltd.—The board amounces that owing to the continued unsatisfactory condition of affairs in Mexico they have to defer the payment of the half-yearly coupon due February 1st next on the 5 per cent. first mortgage gold bonds. Representations have been and are being made on behalf of the company, not only through the British Government, but also to Washington, with a view to protect the interests of those belding the company. holding the company's securities.

Barcelona Traction, Light and Power Co., Ltd. -With reference to the decision of last November to suspend payment of the half-yearly coupon of the 5 per cent first mortgage 50 year bonds and the intention to prepare a plan for providing the necessary funds for continuing and completing the works under construction and for the adjustment of maturing interest, Messrs. H. F. Parshall, Robert Fleming, A. E. Baker, Gilbert Johnstone, James W. Bowhill, Charles D. Seligman and E. R. Pescock have agreed to act as a Committee in the interests of the general body of bondholders to consider the financial arrangements. general body of bondholders to consider the financial arrangements contemplated and submit proposals.

Buenos Aires Port and City Tramways, Ltd.—
A circular issued by the secretary states that the financial position of the company will not allow of the payment of the interest on the first mortgage debenture stock, which falls due on the 1st proximo. The directors are in consultation with a Commiteee—consisting of large holders of this stock and of the first mortgage extension bonds—with a view to promulgating a scheme for the reorganization of the debenture debt and share capital of the company,

Dublin United Tramways Co., Ltd.—The accounts for the year 1914 show that the amount available for division is 198 047. A dividend at the rate of 6 per cent. per annum, less income-tax, is to be paid on the preference shares for the half-year to December 31st, and a final dividend at the rate of 5 per cent. per annum, less income-tax, on the ordinary shares for the halfyear, £18,000 being set aside towards renewal of permanent way, and £5,000 to reserve and renewals fund, £11,366 to be carried

Yorkshire Electric Power Co.-The net profit for 1914, after payment of mortgage interest was £20,535, as compared with £15,401 for 1913. An interim dividend at the rate of 2 per cent. per annum was paid in July, and the directors do not recommend a further distribution, as they wish to strengthen the position of the company.

Central Electric Supply Co., Ltd.—The directors recommend a dividend of 5 per cent. on the ordinary shares for the year 1914, £6 being carried forward.

South London Electric Supply Corporation, Ltd.—The directors recommend, subject to final audit, a dividend on the ordinary shares for the year 1914 at the rate of 5 per cent. per annum, carrying forward £2,897, as against £728 in 1913.

Smithfield Markets Electric Supply Co., Ltd.-The directors recommend a dividend of 2 per cent. (2s. per share) for the year ended December last.

Metropolitan District Railway Co.—Parliament is to be asked to sanction the issue of £300,000 debenture stock.

STOCKS AND SHARES.

Tuesday Evening.

STOCK Exchange business has dropped into a jogtrot in most of the markets. Investment suffered a check by reason of the proposal to lower the minimum prices of Consols and other gilt-edged securities. It is rightly thought that, were this to come about, people would have the feeling that further reductions might be made, and accordingly investors would wait before putting money into markets. Another factor is the advent of a New South Wales loan, with its hint that there may be others to follow before long. The electrical markets are quiet, without much feature; and the most active department in the Stock Exchange, as might well be supposed, is that devoted to armament shares, of which Vickers and Armstrongs are the two favourites.

The Home Railway market cheered up on the declaration of an unexpectedly good dividend by the Lancashire and Yorkshire. The effect radiated to speculative stocks, but stopped short of those connected with the Tube lines. Nor have the latter been influenced by the important extension of the Bakerloo which is shortly to establish physical connection with STOCK Exchange business has dropped into a jogtrot in most

loo which is shortly to establish physical connection with the London and North Western. In ordinary times, this would have had a strengthening effect; but in days of war, it has

have had a strengthening effect; but in days of war, it has gone for nothing.

Underground Electric ordinary touched 2 the other day, to revert later to the previous price of 1½. The company's 6 per cent. income bonds remain steady at 83, and a fear which was current some weeks ago as to a possible scaling-down of the interest on these bonds in respect of the past year, has been succeeded by confidence that such a step will not be necessary. As everyone knows, the London General Omnibus Company is doing splendidly, the Government paying well for the many vehicles that have gone abroad, while those at home are filled to their capacity hour after hour. The National Steam Car dispute with its men aroused the announcement that the company might wind up business and sell its omnibuses to ready customers, presumably in the provinces; if this came about, the people principally to benefit would be those who share in the profits of the L.G.O. Company.

vinces; if this came about, the people principally to benefit would be those who share in the profits of the L.G.O. Company.

The first of the electric lighting companies to declare its dividend is the St. James and Pall Mall. As briefly stated here last week, the dividend for the full year is made up to 10 per cent., comparing with 12 per cent. for 1913. The present rate is the same as that paid continuously between 1906 and 1912. In the period 1897-1904, the annual dividends were 14\(\) per cent. The price is unchanged at 9, which compares very favourably with the average since 1907 to date. The highest "Jimmies" reached in recent years was 19\(\), in 1898, and they went down to 7 eleven years later.

The Smithfield Markets Electric Supply Co. has declared a dividend for the past year of 2 per cent., carrying forward £1,300. This compares with 2\(\) per cent. in 1912. Melbourne Electric ordinary stock was quoted ex rights to-day (Tuesday).

The changes on the week are insignificant, save for a recovery of 2 points in St. James' and Pall Mall debenture stock. Westminster preference are better at 5, though the ordinary shares further declined \(\). City of London ordinary shed \(\) 5s. There remains a demand for County preference: the old and new shares, it may be remarked, are now on all fours. It is hoped that the forthcoming reports will furnish some information on the question of coal contracts. The rise in the price of coal is causing keen interest as to the price at which the companies have contracts running, and still more as to any likelihood of their suffering from shortage, as well as high prices. Parts of London were plunged into temporary darkness on the Zeppelin alarm of Monday evening, when, by the way, several thousands of special constables lost their dinners.

The L.C.C. have decided, after all, that their Electricity Bill shall not go to Parliament. It is tempting to turn round and say: "What did we tell you?"—temptation, however, which shall be sternly resisted, masmuch as (now that the

also embracing within that field great industrial centres in London to which the supply of cheap power will be vital. So once more we are "as we were," and the shrewd observer will have little difficulty in forming his own opinion as to what is likely to be the next, and the successful, development in connection with the pressing question of London's electric supply supply.

Appended is our usual list of stocks and shares in the elec-

trical markets:-

Tolar Rubber
Telegraph Con. 681 103 15 5 1004 9 884

The Telegraph market's principal move is an advance in both classes of Anglo-American stocks. The excellent yield afforded by these has attracted investment attention, and the preferred is now within 1½ of the mean price at the end of July, while the deferred is only ½ from its July figure. Marconis eased off to 1 9-16ths. New York Telephone bonds have come in for a good deal of attention, but there is no change in the price. Americans are hard at 10s.: Canadians stick at 4s. 3d. Telegraph Constructions at 36½ are the fraction higher. Electric Constructions are good, a florin rise taking

the price to 13s. 6d.; and British Westinghouse preference regained their small loss of the previous week. On the other hand, Edison and Swan of both kinds are easier.

No improvement has occurred in the Mexican group, and last week's falls in Mexico Trams have been followed up by another drop of 5 points in the 6 per cent. bonds. Brazil Tractions weakened to 56\frac{1}{2}, a decline of 2, and the Anglo-Argentine quintet remains dull.

Armament shares do little more than hold their ground, but they continue to attract much attention all over the coun-

Armament shares do little more than hold their ground, but they continue to attract much attention all over the country. The optimist's view is that, whether the war is a long one or not, Germany must be crushed, which will mean colossal profits for the armament companies for a long time to come. Some of them are working twenty-four hours a day, and work is being refused in certain cases, because of the impossibility of accepting further orders at present. Armstrongs and Vickers at their present prices yield about 6½ per cent. on the money. The rubber market is steady, the price of the produce keeping about 2s. 2d. per lb.

METAL MARKET

Fluctuations in January.

A Swiss Financial Enterprise in South America.—
The Columbus Company for Electrical Undertakings, which belongs to the Brown-B overi group, was formed in 19.3 for the purpose of acquiring the majority of the shares in the Compania I alo-Argentina de Electricidad, of Buenos Ayres, although its scope has been extended in the meantime to financial transactions in connection with other electrical enterprises in Argentina. According to the report for 1913-14, the company now holds over three-fourths of the capital of the Compania I alo-Argentina, and intends to advance to the latter the funds required for the extension of its supply works, for which a concession has been obtained until 1962. The company, which has also become interested in the supply companies in the towns of Dolores and Corrientes and in two companies in the towns of Pergamino, earned net profits of £5,900 in 1913-14, which sum has been partly placed to reserve and partly carried forward.

A NEW NITROGEN ELECTRIC FURNACE.

AT a meeting of the Society of Chemical Industry, held on January 4th at the Northampton Institute, London, E.C., Mr. E. Kilburn Scott described and demonstrated a new furnace which he has devised for the production of nitrates from the air. The furnace is at present in the experimental stage, but it is so inherently simple in design, sound in principle, and promising as a result of the tests so far made, that there is every reason to believe it will yield results superior to those attained in any of the existing types of furnace.

Introduction.—The development in England of a purely English process for manufacturing nitric acid and other nitrates is a matter of national, as well as purely industrial, importance, for these materials form the basis of explosives, to say nothing of their use in agriculture and the aniline dye industry, and it is, therefore, in a high degree undesirable that we should be dependent entirely upon foreign sources for materials of so important a character. It may be objected that cheap water power, such as exists in profusion in Norway, is indispensable for the profitable development of electric furnace processes of this character. This, however, is largely a delusion, for in more than one district of England steam power can be obtained for constant loads practically as cheap as water power in Norway (the cost of which will always tend to rise on account of increasing rents), and the advantage to England is altogether secured when one considers the cost of the double freights of ammonia to Norway, and ammonium nitrate or nitric acid back again to this country. That the fixation of atmospheric nitrogen will be sooner or later undertaken in England is a certainty; the question we have to consider at the moment is, can the Kilburn Scott furnace fulfil the necessary conditions of low prime cost, small depreciation, simplicity in control, and efficiency in working, which alone will enable it to compete successfully with the types now in use in Norway and elsewhere on the Continent? From the data we have at present at our disposal, it would appear that one is justified in giving an affirmative answer to this question.

Before one can appreciate the advantages claimed by Mr. Kilburn Scott for his furnace, it will be necessary to consider briefly the salient features of the three furnaces at present in use industrially—the Birkeland-Eyde, the Schönherr-Hessberger, and the Pauling.

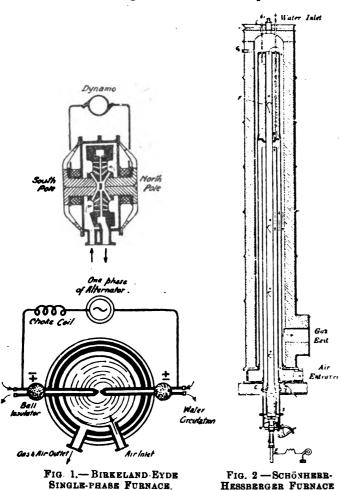

Comparison of Existing Types .- All nitrogen fixation furnaces have electrodes of metal between which alternating current arcs are formed. These arcs are "blown" into flames by a magnetic field, as in the Birkeland-Eyde, or by an air blast, as in all the other types, including the Kilburn Scott. Into the arcs or flames the air under treatment is passed, and under the great heat evolved, and perhaps, too, in luced by the electronic condition of the region of the di-charge, some of the nitrogen and oxygen of the air combine to form nitric oxide, which must be removed to a cooler zone as quickly as possible to prevent its dissocation back into its constituent elements. It will be unnecessary to describe here in any detail the existing types of furnaces, as descriptions of them have frequently been published, and are readily available. It will suffice to state the ideal conditions which should govern the design of a nitrogen furnace, and indicate in what manner the several types fall short of the ideal.

These conditions are : -

- 1. Highest possible temperature of flame (over 3,000° C.)—the higher the temperature, the greater the yield of nitric oxide.
- 2. To ensure a maximum supply of air to the flame and a minimum expenditure of energy in raising it to the necessary temperature.
 - 3. To draw off and cool the fixed gas quickly.
- 4. To minimise adjustments and renewals of the electrodes.
- 5. To ensure automatic regulation of current and continuity of working.

In the Birkeland-Eyde furrace (fig. 1) the arcs, which alternate at 50 cycles a second, burn between the rounded ends of two U-shaped copper electrodes, through which water passes. A powerful electromagnet produces a direct

strong magnetic field at right angles to the electrodes. Consequently, when the alternating current flows the arcs are deflected outwards into the disc-like chamber in which they burn. As a result, a circular sheet of flome is produced. The way in which the air is brought into this flame will be clear from the figure without further explanation.

The criticisms which Mr. Kilburn Scott makes against this furnace are: —

1. The amount of energy required to energise the electromagnets (stated to be 10 per cent. of the total consumption).

3. If three-phase current is available it is not possible to utilise all the three phases in a single furnace. This point will be dealt with more fully presently.

It may be mentioned that at Notodien, in Norway, there are installed 32 Birkeland-Eyde furnaces of 600 to 1,000 kw. each, and at Saaheim there are eight each of 3,500 kw.

capacity,

In the Schönherr-Hessberger furnace (fig. 2) a whirling draught of air maintains a standing arc flame inside the innermost of four vertical concentric annular steel tubes, the diameters of which range from 3 ft. to 6 in. The intermediate tubes allow the incoming air to be preheated, as will be evident from a glance at the diagram. The amount of preheat is stated to be under 500° C. As compared with the Birkeland-Eyde, this furnace has the advantage of using only one kind of electric current, and the energy required for a given output of gas is, therefore, less. On the other hand, the great height of the furnac s (varying from 15 to 30 ft. at the different installations) causes considerable difficulty in maintaining the long arcs, and this, together with the long and devious air-path, presents so many mechanical and electrical difficulties, that large units cannot be built, a drawback, both from the point of view of yield and capital expenditure. Further, it would bardly be Further, it would bardly be possible to run three distinct three phase arcs in one tube . without their collapsing together. At Christiansand the Badische Anilin und Soda Fabrik have erected 12 furnaces, each of 450 kw., and at Staheim there are 96, each of 1,000 kw. The larg st Birkeland-Eyde units, be it noted, are of 3,500 kw.

The Pauling furnace is of the familiar horn lightning rester type. Two electrodes diverge, leaving a fan-shaped arrester type. space between them in which the arc plays. An air-blast causes the whole space to be filled with a sheet of flume. In the ordinary way the arc between such electrodes would travel upwards by the repulsion of the magnetic field, and finally snap out and break the circuit. So, for the flame to be continuous, the distance between the electrodes must be such that the normal voltage will allow a spark to jump across them and re-establish the arc at every half-cycle of the alternating current. The electrodes themselves being set several inches apart to allow the air supply to pass through, the sparking distance is diminished by fixing to the tips of the electrodes thin copper starting knives, which, of course, burn away, and are therefore gradually fed forward to preserve the arc. It will be gathered that the furnace is exceedingly simple compared with the two previous types, but the adjustable electrodes are a source of weakness Mr.

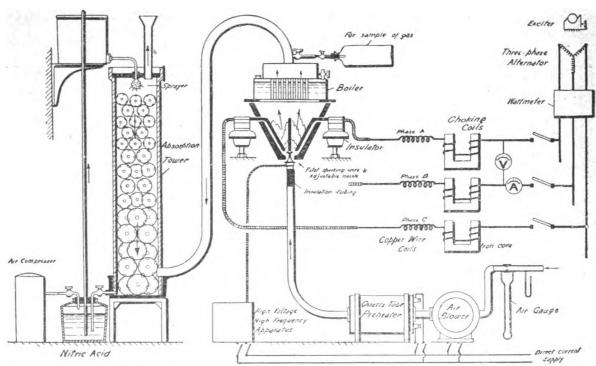

FIG. 3.—LAY-OUT OF KILBURN-SCOTT EXPERIMENTAL PLANT.

2. The impossibility of preheating the air before it passes into the flame.

Scott is of opinion, and the same view is expressed in a Report published by the Department of Commerce and Labour of

the United States, that of the three furnaces at present in use, the Pauling is certainly likely to prove the most successful. All the furnaces, however, share the defect that they are unable to operate with three-phase current in one furnace, and it is this defect which Mr. Kilburn Scott set himself to remedy.

Three-Phase Working.—The advantage of three-phase working is twofold. In the first place, the general use of

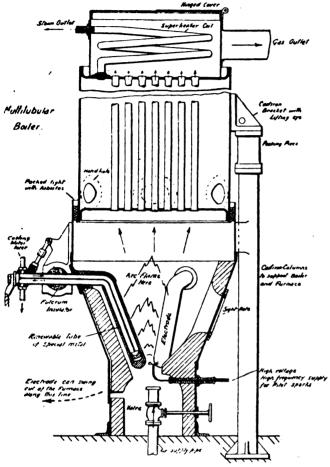

FIG. 4.—SECTIONAL ELEVATION; KILBURN-SCOTT THREE-PHASE FURNACE.

three-phase systems renders it almost a necessity in the case of a furnace that is going to purchase from an existing centre its supply of electrical energy. Perhaps an even greater advantage than this is the higher temperature that was predicted, not unnaturally, that a three-phase furnace would not balance well, would consume its electrodes unequally, and so forth. Experiment has convinced Mr. Kilburn Scott that none of these faults appear in practice, and certainly the little three-phase experimenta furnace which can be seen working at the Northampton Institute operates as evenly and as steadily as can be desired.

The Kilburn Scott Furnace.—A sectional elevation of the small experimental furnace appears black in the centre of fig. 3. In general principle the furnace follows the Pauling type, except that there are three electrodes instead of two, and the starting device is simpler than the auxiliary electrodes of the Pauling furnace. In the small furnace,

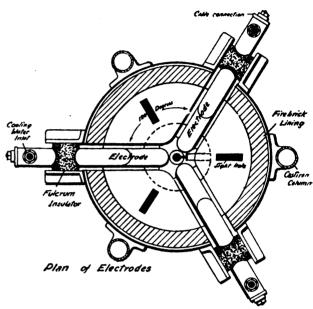

FIG. 5.—PLAN OF KILBURN-SCOTT THREE-PHASE FURNACE.

which was shown working at the meeting, the electrodes made of ½-in. steel rod bent as shown in fig. 3, pass through holes drilled in a fireclay crucible which forms the furnace-chamber, and through the bottom of which the air under treatment is blown, after being preheated in a small electric tube furnace. Three-phase current at 2,000 watts, 25 periods, is applied to these electrodes, in series with each of which is a set of choking coils—necessary for steady working. When the current is flowing, and the air is blown through, the whole crucible is filled with a mass of roaring blue flame. The starting device will be described immediately.

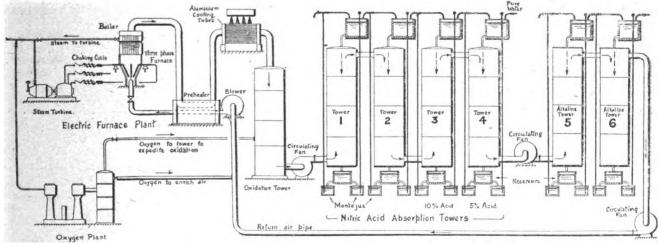

FIG. 6.—NITRIC ACID PLANT WORKING REGENERATIVELY WITH KILBURN-SCOTT FURNACE AND WITH OXYGENATED AIR ON CLOSED CYCLS.

Mr. Kilburn Scott has shown to be obtainable in a triple flame compounded of three separate alternating current arcs. This, as already stated, may mean a considerable increase in the yield of fixed gas per unit of electrical energy absorbed, and, provided only the thing is feasible and practical, this advantage should secure for a three-phase furnace an undoubted superiority over its rivals. It

Figs. 4 and 5 illustrate the furnace as it would be constructed in practice. The electrodes here consist of steel tube divided longitudinally into two parts so that the cooling water travels up one side and down the other. A renewable tube of cast steel encases the electrodes; these, as they burn away, can easily be turned round, and finally renewed.

In the Pauling furnace new sections of tube have to be fitted in, a much more lengthy and troublesome pro-The way in which the electrodes are fixed and insulated is sufficiently well indicated in fig. 4. The arcs are started by a high-voltage high-frequency spark which is emitted from the pilot sparking conductor (to earth through the electrodes), shown in close proximity to the bottom of the right electrode in fig. 4. These high-tension sparks continuously break down the air dielectric, and so maintain the three-phase main current. It is interesting to note that the two electrical circuits do not in any way interfere with one another. The necessity for the pilot spark enables the main current to be entirely put on or cut off by means of an ordinary tumbler switch which controls the primary sparking current. The ingenious method of maintaining the man arcs here described is a characteristic feature of Mr. Kilburn Scott's furnace, and unless any unforeseen difficulty should prevent its working on a large scale, it should prove a greatly superior method to the auxiliary copper electrodes used in the Pauling furnace. As the pilot conductor passes through a porcelain insulator into the furnace below the electrodes, where it is comparatively cool,

there seems no reason to anticipate any special difficulties.

Another striking, and, indeed, a very bold feature of this furnace is the multitubular boiler placed immediately above the flames, as shown in figs. 8 and 4. The boiler, in fact, actually forms the roof of the furnace. The purpose of the boiler is, of course, to cool the gases as soon as possible and as quickly as possible after they leave the zone of reaction. Experience with the experimental furnace convinces Mr. Kilburn Scott that no difficulties will arise with the boiler in an industrial furnace. The nitric gases that play upon it will not yet be in the peroxide state, and one gathers that nitric oxide, even at a high temperature, will not attack iron. It will be necessary, or at least desirable, to employ in the boiler pure feed-water, and this, combined with the rapid circulation brought about by the very high temperature, is likely to minimise the formation of scale.

The steam raised in the boiler is to be used to generate electrical energy, as shown in fig. 6, so that the combination will be regenerative. Naturally, not the whole of the electrical energy required can be raised in this way! (The diagram is somewhat misleading in this respect.) As a matter of fact, the regenerative value of the steam so raised

is likely to be some 15 per cent.

In fig. 6 are also indicated other regenerative features of the process; namely, the oxygenation of the air supply to the furnace, the cyclical working of the process, as far as the air supply is concerned, so as not to waste oxygen, and the way in which the preheating of the air entering the furnace is . effected. With regard to the oxygenation of the air, this would best be brought about by linking up the nitric acid works with processes in which oxygen is a by-product, such as the manufacture of hydrogen for air-craft or for the hydrogenation of oils, or the manufacture of calcium cyanamide. These, however, are chemical aspects of the process, and, moreover, they are not peculiar to any particular type of furnace, so they need not be enlarged upon here. The same remarks apply to the working up of the nitric oxide into marketable products. In fig. 5 a series of towers are shown indicating the general form of the plant if it is desired to make nitric acid, the most useful and valuable of the nitrogen products. From this ammonium nitrate is easily made by direct contact with ammonia. At present it appears that ammonia is actually shipped to Norway for this purpose, and the ammonium nitrate brought back again here for the explosive manufacturer or the farmer. This strange state of affairs is a cogent argument for the establishment of nitric acid manufacture in this country on a scale commensurate with our needs. There is no valid reason on the electrical side, even if the prime source be not water power (it probably could be), why the electrical process should not work as successfully here as it does in Norway or elsewhere on the Continent, and if Mr. Kilburn Scott's claims for the increased yield of his three-phase furnace are realised on a large scale, and on the face of it there seems no reason why they should not be, his process will help greatly the development of a home industry of quite national importance.

THE TELEPHONE IN SURGERY.

A GOOD deal of interest has lately been aroused in medical circles by a new development in the application of the telephone to surgery. It is more than 30 years since Graham Bell suggested, apropos of the attempts which had been made to locate the bullet in the body of President Garfield by means of the induction balance, that a simpler method would have been-he was speaking some months after the death of the President-to use a telephone, attaching to one terminal a fine needle, and to the other a plate of metal of The plate would then be placed on the the same nature. limb to be examined, and the needle thrust in where the bullet was believed to be. On its making contact a galvanic battery would be formed within the body, which would cause a click to be heard in the telephone, and would guide the surgeon to the position of the foreign hodv.

This device was employed by Dr. (now Sir) James Mackenzie Davidson in Aberdeen to locate a bullet in the head of a patient, and was afterwards used in a limited way during the South African war. Until recently, however, the condition laid down by Graham Bell, namely, that the instruments used for exploration must be of the same metal as the plate placed on the patient's skin, was thought to be

essential to the success of the method.

In a communication made to the Medical Society of London on January 25th, Sir James Mackenzie Davidson stated that he had now discovered that this was not at all the case, and that the telephone attachment could be used with any metallic instrument at the surgeon's command. Finding that the dissimilarity of the metals did not impair the value of the result, he tried several pairs in order to discover which would give the most The embedded metals for which the distinctive sound. surgeon had usually to search were lead, nickel, copper, iron, and some of the iron alloys used in shell manufacture, while the surgeon's instruments were usually steel, silver, or nickel-plated. With any of these instruments attached to one terminal of the telephone, he found that on contact with any of the above-mentioned metals, the loudest sound was elicited when a plate of carbon, such as was used in an ordinary bichromate cell, was attached to the other terminal. The currents generated were, naturally, small and of low pressure, and it was necessary to reduce the resistance of the body by using as large a plate of carbon as possible, and to increase the conductivity of the skin by moistening it with salt solution. He found that a cheap telephone of 60 ohms resistance, costing only a few shillings, detected these small currents better and gave a louder sound than the more expensive high-resistance telephones used in wireless tele-

Sir James demonstrated his method of procedure, which consisted in the use of a telephone with double receivers for attachment to the surgeon's head, one terminal of the telephone being brought to the carbon plate, and the other to a disinfected silver wire which was bound round or clipped on to the knife, probe, needle, forceps, or whatever instrument the surgeon might wish to use. The instrument, on first contact with a bullet, gave rise to an unmistakable click on the telephone, and, when a rubbing contact was made, to a distinct microphonic rattle, and under this guidance the

embedded metal could be extracted.

The lecturer added that he had found no special advantage result from the introduction of a battery into the circuit. One modification which might be employed, in the case of a surgeon whose hearing was not acute, was to pass the current, not through the telephone, but through a suitably wound galvanometer, when the movement of the galvanometer needle would indicate contact with the metal, or the arrangement could work as a relay, and a bell could be made to ring every time the bullet was touched by the surgeon's implement.

Sir James, whose demonstration obviously impressed his fellow surgeons, prophesied that a time would come when no surgeon would attempt to remove a deeply embedded metallic body without having this telephone attachment at hand.

THE SHAPE OF THE PRESSURE WAVE IN ELECTRICAL MACHINERY.

Part I, by S. P. SMITH, D.Sc., A.M.I.E.E., and R. S. H. BOULDING, B.Sc. Part II, by S. P. SMITH, D.Sc.

(Abstract of paper read before the Institution of Electrical ENGINEERS, January 14th, 1915.)

In Part I the electromotive force induced in windings is determined analytically, and the effect of flux-swinging is investigated. The importance of the winding factor is emphasised. Experimental confirmation is given wherever possible. (No attention must be paid to the relative magnitudes and phase displacements of the

oscillograms here reproduced.)

In Part II an attempt is made to amplify and illustrate the analytical results obtained in Part I, by means of the vector diagram and by examples. Also the advantages of using the vector diagram of the fundamental for studying the circuits in a double-layer commutator winding are shown, and simple rules for obtaining the positions of the various phase tappings and connections are given.

One of the greatest advances that have been made in the development of electromagnetic machinery during the present century is the approach in the shape of the pressure wave to the ideal sine Several reasons have combined to bring about this result. Thus the wide extension of the three-phase system with star-con-nected generators has removed from the interlinked or line pressure the third harmonic, which is sometimes considerable in the phase

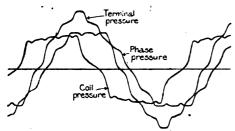

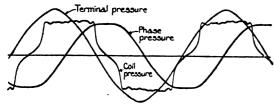

FIG. 1.—OFCILLOGRAMS SHOWING SPACING RIPPLE IN PHASE AND TERMINAL PRESSURES OF THREE PHASE SALIENT-POLE ALTERNATOR, HAVING SIX SEMI-CLOSED SLOTS PER POLE.

Again, the adoption of the non-salient-pole construction for the rotors of turbo-alternators has made it possible to obtain a flux distribution which remains nearly sinusoidal under all conditions of load. Finally, the designer has also learnt what refinements are necessary in order that the pressure curve may be free

from ripples.

Although there are cases where the shape of the pressure wave is not important, there is no doubt that the pure sine curve is best for general alternating-current working. Thus, the troubles is not important, there is no doubt that the pure sine curve is best for general alternating-current working. Thus, the troubles occasioned by earthing the neutral, which is now common practice in central-station working, are mainly due to the existence of a third harmonic in the phase pressure. Cases arise also in the parallel working of synchronous machines where the interchange of wattless currents due to the higher harmonics becomes excessive. As an instance, a case may be cited of a six-phase rotary converter working direct off a six-wire, three-phase generator,

2.—OSCILLOGRAMS SHOWING SUPPRESSION OF SPACING RIPPLE—DUE TO FRACTIONAL NUMBER OF SLOTS PER POLE

-- FROM PHASE AND TERMINAL PRESSURES OF THREEPHASE SALIENT-POLE ALTERNATOR, OPENED WAVE WIND--108 SLOTS (SEMI-CLOSED); 16 POLES; 6.75 SLOTS PER POLE

where, owing to the harmonics, the current taken when the conwas running light was equal to the normal full-load current.

Numerous other factors of varying importance, such as low losses and high power factor in the system, safety in high-tension working, freedom from disturbances to telephones, and from resonance, &c., all demand an absence of harmonics. Also, when a four-wire, three-phase system is used for a lighting supply, the use of a pure sine wave results in the ratio, phase pressure to star sure, being constant.

The sine curve is the most natural standard, and it is generally attainable, which would not be the case with other wave shapes. Also, the majority of our simple calculations and vector diagrams are only possible on the assumption that the quantities in question

vary sinusoidally.

In Sec. 1, under the head of "Classification of Windings," the authors show that where the number of slots per pole is an integer, and a normal arrangement of slots and poles is adopted, the effect of the teeth on the wave form will be greatest (fig. 1). When the poles or slots are skewed in such a manner as to make the conductors occupy all possible positions in the field, the winding is (quivalent to a uniformly distributed winding, and the effect of the teeth is nil. When the pole-shoes are displaced, or the number of slots per pole is fractional, the equivalent distribution of the winding is increased (fig. 2).

In all cases where there is an abnormal arrangement of the field

In all cases where there is an abnormal arrangement of the field or armature system, or a fractional number of slots per pole, it is allowable in practice to regard the winding as uniformly distri-

buted.

In Sec. 2, a general expression for the electromotive force induced in a coil is obtained. When a coil moves relatively to the flux, an electromotive force of motion or rotation is said to be induced in it, whilst if the flux itself varies, an electromotive force of pulsation is induced. With continuous-current excitation the flux is steady, except in so far as pulsations are set up by the teeth or by armsture reaction. It is here assumed throughout that the machine is unloaded. It is shown that the curve of electromotive force induced in each side of a coil is identical in shape with that of the flux distribution, but the two pressures are only in phase when the coil spans a full pitch. The coil-span factor can

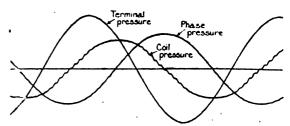

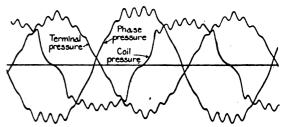

FIG. 3.—OSCILLOGRAMS SHOWING EFFECT OF ROTOR TEETH OF NON-SALIENT-POLE TURBO-ALTEBNATOR, 24 STATOR SLOTS, NEARLY CLOSED; 40 ROTOR SLOTS CLOSED WITH CAST-IRON WEDGES, 16/20 WOUND; 2 POLES. ROTOR SLOTTED UNIFORMLY OVER WHOLE PERIPHERY.

effectively suppress certain harmonics in the induced pressure. For instance, if the coil spans two-thirds of a pole-pitch, the third harmonic disappears.

In Sec. 3, the electromotive force induced in a circuit of a winding by rotation in a steady field is investigated in detail, and tables of distribution and reduction factors for various windings

Incidentally it is shown that there can never be a third harmonic in the line pressure of a star-connected three-phase generator, nor in the alternating pressure of a three-phase rotary converter, nor in the phase pressure when each phase extends over two-thirds of the pole-pitch, nor in the pressure of a single-phase alternator with two-thirds of the periphery wound. This also holds when the winding is placed in slots instead of being uniformly distributed. In a similar way, when the spread of winding equals two-fifths or four fifths, no harmonic which is a multiple of 5 can appear in the sure cui ve.

The effects of the slots in the rotor and stator are considered, and it is shown that when the numbers of slots per pole-pair on the stator and rotor are equal, or only differ by two, a very pronounced ripple of a high order may appear in the pressure (fig. 5)

. 4 —OSCILLOGRAMS SHOWING TOOTH RIPPLE DUE TO FLUX SWINGING IN THREE-PHASE SALIENT-POLE ALTERNATOR WITH A WHOLE NUMBER OF SLOIS PER POLE. OPEN

The spacing ripple in salient-pole machines is chiefly important with two or three slots per pole and per phase, and unless one of the several methods for making the winding factor very small the several methods for making the winding factor very small is used, it is generally advisable when a smooth pressure wave is needed, to round off the pole tips so as to reduce the harmonics. With non-salient-pole machines, the number of stator slots per pole is generally larger, and the chief care must be taken to avoid clashing with the number of teeth on the rotor.

The effect of flux pulsations due to teeth is dealt with in Sec. 4. Since most of the flux is carried by the teeth and very little by the Since most of the flux is carried by the teeth and very little by the slots, there is always a tendency for it to move as the teeth enter and leave the pole-arc. When the magnetic path in the gap has a constant reluctance but variable position, the flux will swing to and fro; when the reluctance varies, the flux will change in amount. It is probable that both these movements take place to some extent in all slotted armatures, though the former is alone

of importance, as a rule.

Unless the whole magnetic circuit is well laminated the change in the flux can never be very large, since there will always be a tendency for oscillations in the magnitude of the flux to be

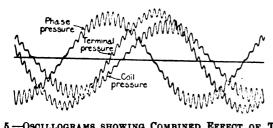

damped out by eddy currents and currents induced in the exciting Both experience and experiment confirm this view.

The EMF. ripple due to swinging of total flux is of much greater importance, since with laminated shoes there is comparatively little hindrance to the flux swinging. In the worst case magnitude of this swing would equal the flux of one tooth, and from oscillograms it is often found to exceed one-half of this amount (fig. 4). The larger the number of teeth per pole the smaller the possible swing.

The amount of flux swinging depends largely on the constructional details of the machine such as the number of slots are released.

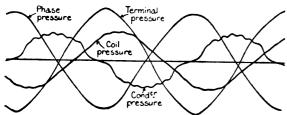

tional details of the machine, such as the number of slots per pole, the ratio of slot-opening to gap, the skewing of the slots or pole-

-Oscillograms showing Combined Effect of Tooth RIPPLE AND SPACING OF ROTOR SLOTS IN THREE PHASE NON-SALIENT POLE TURBO-ALTERNATOR. STATOR: 36 SEMI-CLOSED SLOTS; ROTOR: 34 SEMI-CLOSED SLOTS WITH BRASS WEDGES, 14/17 WOUND; TWO POLES. ROTOR SLOTTED UNIFORMLY OVER WHOLE PERIPHERY.

those, &c., and by suitable design it can be made fairly small. The commonest method for reducing the swing is to use nearly closed slots.

Fig. 5 shows the effect of an unsatisfactory choice of numbers of slots. In fig. 6, instead of only having the required number of slots, namely, 144, there were 150. The machine had open slots. As we should expect, the pressure induced in a conductor reveals a fairly strong tooth ripple, thus proving that the flux was swinging. In the coil pressure, the ripple is already reduced, owing to the fact that the electromotive forces are not identical in phase; whilst the phase and terminal pressures are quite smooth.

-OSCILLOGRAMS SHOWING SUPPRESSION OF TOOTH AND SPACING RIPPLES FROM PHASE AND TERMINAL PRESSURE
OF THERE PHASE
SALIENT-POLE ALTERNATOR WITH A FRACTIONAL NUMBER OF SLOTS PER POLE. 150 SLOTS (OPEN); 16 POLIS; 9'375 SLOTS PER POLE.

There are external methods of suppressing the tooth ripple from the terminal pressure. For example, a method that has found favour of late years has been the use of a resonance circuit across the terminals of the machine, adjusted to resound with the frequency of the tooth ripple; though in most cases the addition of one or two extra slots would certainly be a much cheaper and an effective way of preventing disturbances in telephones.

Regarding the effects due to the clots and teeth, it is obvious that in general it is possible to build machines nowadays in which all such effects are eliminated from the pressure wave.

DISCUSSION IN LONDON.

Dr. S. P. Thompson said the paper formed a brief account of the state of affairs, as known and added to by the authors, at the present time. No doubt many of the things mentioned had been present time. No doubt many of the things mentioned had been touched upon by previous investigators; but the authors had suctionable the effect of ripples. ceeded better than any before in investigating the effect of ripples, and it would be as well to provide some adjective to distinguish and it would be as well to provide some adjective to distinguish between ripples due to stator and rotor slots. Amongst other things, the authors had given them a new definition of "circuit" which it would be difficult to apply generally. The authors enumerated the advantages of the pure sine wave, but also reminded them that they should have the flux form a pure sine curve, as then there would be no need for devices to correct it. The non-ealient form of pole properly wound was better for flux distribution, and was better from the mechanical point of view. He thought it would be advantageous to simplify the mathematics for those who would make practical use of the paper in the future. for those who would make practical use of the paper in the future, and as it stopped short of certain matters, perhaps the authors

would follow it up.

MR. BURGE said, with the exception of turbo-alternators, pole with the exception of turbo-alternators, pole slots could not be slanted, as they were usually laminated. He wished the authors had not set aside the question of wave form on load; he mentioned this in regard to the proposal to use alternators with poor regulation instead of reactances.

MR. C. C. HAWKINS said the authors had not mentioned the us of the mid-coil arrangement for suppressing certain harmonics; it was not right to be satisfied when the harmonics were reduced to very small proportions, as they might give rise to very serious effects. The authors were rather uncertain on certain matters regarding flux swinging; he thought it was agreed that with fringing the conditions were reversed. He thought it was necessary to have the whole circle of polar fringe in order to make

sary to have the whole circle of polar fringe in order to make reliable deductions as to swinging.

MR. A. R. EVEREST said the salient-pole rotor could be made to give just as good an approach to the sine wave as the drum type. He thought it was obviously impossible to adopt irregular slotting or spacing of coils on a large scale for manufacturing reasons; a fractional number of slots per pole was a good method. He believed the American Institute allowed as a standard any harmonic not to exceed 10 per cent of the main wave but a newer monic not to exceed 10 per cent. of the main wave, but a newer standard was proposed.

Dr. Howe emphasised his belief in the correctness of fig. 19 in the paper (in regard to which it may be mentioned that an alternative unsymmetrical figure had been discarded as being doubtful).

It ought to be quite clear whether reference was made to ripples or to the harmonics into which they were divided.

MR. JAKEMAN did not think it practicable to use an extra slot as suggested, except for single-phase machines, and taking all points into consideration he thought higher harmonics might still be present if extra slots were used.

The AUTHORS, in replying, said the effect of load was now being considered. DR. SMITH explained that they were not advocating anything, in particular, and were investigating everything that

anything in particular, and were investigating everything that came along. He had not yet arrived at a conclusion as to the correctness or otherwise of the unsymmetrical edition of fig. 19.

DISCUSSION AT MANCHESTER.

PROF. MILES WALKER said the authors were to be congratulated upon having given a solution of what had always been regarded by designers as a very troublesome problem. Present-day engineers had found from experience the desirability of keeping down the ripple in the E.M.F. wave as much as possible. Some engineers even inserted a clause in the specifications regarding the percentage ripple allowable, and this might be 1 per cent, or over. The main difficulty with the designer had been to predetermine the amount of ripple; it was a comparatively simple matter to take the EM.F. of a single conductor in a machine and so determine the field form, but it was quite another matter to deduce from the field form the final EMF. wave form. This was the problem the authors had solved. The tables given enabled the designer to predetermine without any trouble the value of any harmonic in the final EMF. wave form. It was to be hoped that the authors would pursue their investigations and give the results of full-load working in addition to the no-load results recorded in the present paper. The paper was an admirable case of applied mathematics producing tables of real commercial value.

MB. K. M. FAYE-HANSEN, speaking from the point of view of an alternator designer, said that most of the conclusions were known to the specialist designer, but they had never been brought forward in such a clear manner and arranged so that the result of higher harmonics could be easily predetermined. The employment of fractional windings was a useful expedient and gave excellent

results, but sometimes there were economical reasons against it, the chief of which was the use of parallel connections.

PROF, FIELD said that the extent to which a slight ripple might be of great practical importance was illustrated by the fact that purchasers' specifications usually limited the no-load value, whereas the value of vital importance was the full-load operation; it was very hard to specify that, because it was necessary also to specify the nature of the load. In the case of a machine which it was the nature of the load. In the case of a machine which it was required to delta-connect, it was of great importance to investigate the matter in advance and see that the third or seventh harmonic would permit delta-connection without serious circulating currents. Unless special precautions were taken, serious trouble might arise from the ninth harmonic. In the case of the New York Edison Co. and several other stations in the U.S.A. the original operating voltage was 6,600, but the plant was arranged for ultimate conversion to 11,000 volts; in consequence the large generators were arranged to be delta-connected. In most cases the turbo-alternator had been wound with a two-thirds coil pitch, which completely eliminated the third and ninth harmonics. He took exception to the authors statement to the effect that on the statement would be a statement to the effect that on the statement would be statement to the effect that on the statement would be statement to the effect that one than the statement which will be will be supported by the statement to the effect that one than the statement which will be supported by the statement to the effect that one than the statement which will be supported by the statement to the effect that one than the statement to the effect that one that the statement to the effect that one the statement to the effect that one the effect that one that the statement that the statement that the statement to the effect that one that the statement t alternator work a full-pitch winding was usually employed. In the States it was more common than otherwise to have a chorded winding on alternators, particularly turbos. In order to illustrate winding on alternators, particularly turbos. In order to litustrate
the comparatively big effect of a very small harmonic, he cited the
care of a machine with the winding chorded not quite two-thirds,
but two-thirds plus or minus one slot. The effect would be almost
completely to wipe cut the third harmonic, the only effective
amount being due to the discrepancy of one slot. The value of the
third harmonic might have been considered too small to be of any account, but the ultimate burning-out of windings in slots where the coils crossed was found to be due to this circulating third harmonic current together with the extra losses due to high

frequency.

DR. G. W. WOBRALL, in a written communication, said that his general impression was that the authors had not sufficiently considered the individual ripple E.M.F.'s generated; the ripples in the conductor might be considerable, although the wave of terminal pressure was quite smooth. When several conductors were connected in parallel, the ripple E.M.F.'s sometimes produced circulating currents which caused unequal local heating of the machine. The ripples also caused vibration of the teeth, and serious breakdowns were by no means uncommon, which were without doubt due to this cause. There must, of course, be a certain amount of looseness in the stampings to allow the vibration to take place, but

such looseness might not be due to defective manufacture in the first instance. During the past few months two machines broke down in this way, one, a slow-speed alternator, after a few weeks' running, and the other a high-speed turbo-alternator after eight years' running. It was, therefore, of the utmost importance to suppress the ripples as far as possible in each conductor, and not

merely cancel them out in the aggregate.

MR. R. S. H. BOULDING, in reply, said the only way to get rid of ripples was to avoid swinging, which could be approximately carried out by the method mentioned in the paper. Whilst the paper was confined to nc-load effects, the same method applied to full-load considerations, and the results were to be regarded as qualitative rather than quantitative.

paper was considerations, and the results were to be regarded as qualitative rather than quantitative.

Dr. Smith, in reply to Mr. Faye-Hansen, said considerable difficulty was experienced with the shope in regard to cutting extra slots. No doubt it was a commercial question. The question of parallel circuits was very important; in the case of a two-pole machine it was practically hopeless, but with a four-pole machine two extra slots across a diameter were easily added. Generally speaking, it did not cost as much to have two extra slots as to chamfer the pole-pieces. Prof. Field mentioned the case of machines which did not have identical circuits; the whole paper went to show that identical circuits were necessary. Unsymmetrical windings were not to be advocated, and there was no reason for departing from this excellent rule. reason for departing from this excellent rule.

ELECTRIC HEATING AND COOKING.

Ar the last meeting of the "Point Five" Association, held in London on January 15th, Mr. Hefford, of Leeds, was elected

in London on January 15th, Mr. Hefford, of Leeds, was elected a member.

Mr. Harold Gray, of Accrington (the Chairman), an abstract of whose remarks we give, said that in many undertakings there are other users of equal or greater importance than those in the domestic field. A suitable domestic tariff has been formed and established, and it is time that the efforts of the Association were concentrated on reclaiming another field, the trading class of property covering shops, hotels, etc. The enormous variation in the rateable value of this class of property depending on its position is a serious drawback to the elaboration of a rateable tariff.

A rate based on a sliding scale of percentages on rateable

elaboration of a rateable tariff.

A rate based on a sliding scale of percentages on rateable value and a fixed price per unit worked out as the result of combined experience, is a tariff which could be utilised advantageously and with profit to all concerned. The higher rated premises would have a lower percentage charge on the rateable value than the smaller ones. The general lines of the tariff being arrived at, it could be pigeonholed until an opportune time arrived to put it into force in a particular district. There are now a number of big shops which use artificial light in their interiors for all the working hours of the day and for many months in the year, for which where a flat rate of charge is in force gas illumination is employed. This would at once be rectified if a tariff on the above lines were in force.

The writer communicated with leading manufacturers ask-

The writer communicated with leading manufacturers ask-The writer communicated with leading manufacturers asking them to state how their sale of apparatus compared in "Point Five" undertakings and others; the replies without exception indicated that for a given size of undertaking the demand for appliances is considerably in excess of that in flat rate districts. This explains why Association members are given favourable buying terms and why the suggestions of its members for improvement or alteration in apparatus are at once put in hand and often made their standard selling line

on the subject of apparatus, if the result of sales is an index, the hot bar fire is rapidly superseding the lamp radiator as a heating medium except in special cases. There is the advantage in the former that toasting and grilling in a "Dutch" oven, etc., can be effected and the renewal of

Sections is cheap.

While on the question of heating, mention might be made of a somewhat interesting experiment carried out a made of a somewhat interesting experiment carried out a few weeks ago. The congregation in a church suffered on Sundays from a severe down draft, and the electrical department were asked to put the matter right. It was handled as follows:—A ring of hot bar strips covered with expanded metal with occasional gaps was run round the nave of the church at a height of 21 ft. from the floor and 15 ft. from the top of the main aisle. The total loading of the heaters was 20 kw., the switching arrangements being such that either 10 or 20 kw. could be applied. This circuit is turned on first thing in the morning with the ventilators in a definite position to create an upward current, and thus get rid of the humid atmosphere in the building, and the writer is assured that the trouble has now been cured. A development of this application would produce quite a useful Sunday morning load.

The type of vacuum cleaner most suitable in a particular

The type of vacuum cleaner most suitable in a particular class of house still appears to be an open question. For big houses the use of a central permanent installation with pipes run to various points and flexible hose pipes and appliances coupled from these points is probably the only entirely satisfactory arrangement. The machine of the carpet sweeper type in which the motor is wheeled along is convenient in use in that it has no flexible hose pipes to handle, but it is not very that it has no flexible hose-pipe to handle, but it is not very

handy for cleaning under low furniture. This type almost invariably collects the dust in a bag, and it is noticeable that in some cases the exhausted air is not as pure as one could desire. The other type in use is that in which the cleaning apparatus is carried to a convenient stationary position and flexible hose-pipes and attachments worked from the machine in this position. This type has the advantage that cleaning can be done effectually under very low furniture and on walls, etc., without much trouble, but the heavy flexible hose-pipe is rather anyward to manipulate is rather awkward to manipulate.

As regards electric cookers, a thoroughly reliable article can be obtained at a reasonable price provided all elaborations are excluded. A cooker built on similar lines to a gas cooker, of cast-iron, having removable fittings, with hot plate and grill on the top of the oven and without circuit indicators, thermo-

on the top of the oven and without circuit indicators, thermometer and inspection window, etc., appears to give satisfaction in the majority of cases (i.e., its operation is better than a gas ccoker) and perhaps generalising, the simpler the machine the less trouble it will give in the long run.

For better class work where the customer will pay an increased price, useful elaborations are much valued; thus there appears a tendency where there is room to have the griller and boiling rings removed from the oven and put on one side. The oven can, of course, in this case be raised to a more convenient height. Indicating lights to show which circuit is in use are also useful and a thermometer, once its value is tested, is invaluable. There does not appear to the writer any valid reason why the simpler class of cooker mentioned above valid reason why the simpler class of cooker mentioned above could not now practically be standardised in order that quan-tities could be manufactured in big batches and the selling cost reduced.

The standardising of hot plates might present difficulties; it is probable that the radiant heat (red hot) plate will be ultimately the most satisfactory type. Rapid operation can never be effected if the heating element has to heat up an iron plate as a preliminary to the heat being passed on to the cooking

as a preliminary to the neat being passed on vessel.

The question of the pressure of supply to heavy current consuming devices is now becoming important. Should a consumer put a balanced load on the distributor (i.e., on the outers of a D.C. network or three-phase on an A.C. network) or should he have an ordinary lighting service? Simplicity certainly dictates the latter course, and in thickly supplied areas consumers demands can be fairly well balanced, but in our district, in one or two isolated cases we have adopted the former course to avoid objectionable effects on the local lighting.

It is interesting to find that in the Accrington district more appliances have been connected to the system during the last three months than in any preceding quarter of the history of

the undertaking.

DISCUSSION.

Discussion.

Mr. Pickvance, who opened the discussion, said the objects of the Association were, according to the Articles, simply to foster the consumption of electrical energy for domestic purposes. Without any reconstruction of rateable value tariffs, but simply by means of an active business propaganda amongst the shopkeepers, the Chairman could, no doubt, have a higher percentage of shop lighting consumers than he possessed at present. Shop lighting did not need the aid of a special body of engineers for its development. A plain flat rate, with a reduction according to quantity consumed, should meet with a favourable reception, especially if followed up by a proper system of business development. He disliked the differential percentage charge: any variation of the fixed charge, according to the size of the rateable value, seemed to be a most unorthodox way of applying the rateable value system. Although strongly in favour of this tariff for domestic purposes, he did not see how it could be applied to shop lighting and business premises generally. They would certainly have trouble with the different classes of consumers. As regarded that class of consumer who used artificial light during the daytime, this was met in Wrexham by a very simple tariff which provided that the amount used beyond a certain number of units per 8 c.p. or 30-watt lamp, per quarter, should be charged at a reduced figure, less than half the amount of the ordinary flat rate. It worked remarkably well as regarded hotels and large shops, and was automatic in this application, particularly as regarded those few shopkeepers who used the electric light principally for window lighting and had gas at the rear of their premises.

Mr. Allen did not see how the rateable value system could be applied to shops, but thought the objects of the Association were quite sufficiently definite, and that it had an enormous field in front of it in domestic supplies and appliances, and that it was unnecessary to widen the scope of the Association to take in o

mous neid in front of it in domestic supplies and appliances, and that it was unnecessary to widen the scope of the Association to take in other classes of supply. In his opinion it was better to tackle one thing and do it thoroughly. He had carried out some useful experiments with nichrome No. 2 wire, and mentioned that after maintaining a coil of wire at red heat for two months in oxygen no sign of oxidisation could be the supplied to the believe that the present times with be seen. He did not believe that the present time was a suitable one to attempt standardising cookers, as the development was so rapid and might turn along totally different lines to

the present.

Mr. Barham considered that for new domestic supplies a two-rate system was all that was required. He emphasis the drawback to the industry of the want of hiring powers.

Mr. Grogan also considered that it was impossible to apply the rateable value system to shops, and advocated a sliding scale method of applying the rateable value system to residences in some districts. Mr. Grogan made some useful remarks on the heat distribution in ovens, and gave a description of a large electric restaurant in Derby at a cinema palace. He gave the working details of the restaurant, and added the information that the proprietors were entirely satisfied with the result.

fied with the result.

Mr. Shaw (Ilford) considered that a suitable tariff for shops was the well-known maximum demand system, which he had

Mr. Shaw (Ilford) considered that a suitable tariff for shops was the well-known maximum demand system, which he had found quite satisfactory, the rateable value system not being applicable. He also pointed out that it was impossible to push heating and cooking apparatus, even with a low tariff, if the electric supply authority was not in a position to hire out the apparatus. He found that amongst his consumers the hotbar type of heater was far and away the most popular.

Mr. Roles (Bradford) found that in his district the demand for lamp radiators had dwindled to practically nothing. As regards the hot-bar type of heaters, the trouble had been to get them from the makers, not to sell them. Mr. Roles referred to the fact that in Bradford many consumers were utilising hot-bar heaters for other purposes than heating rooms, namely, for making toast and for warming in connection with the preparation of food.

Mr. Nevill (Wakefield), one of the most recent "Point Fives," gave some interesting figures showing the great increase in his business since the Point Five tariff was instituted for heating and cooking. He also referred to the considerable increase in the use of electricity for heating shops; and mentioned that his peak load had not been affected by the increase in heating and cooking. It was the same amount in kw. that it had been for over ten years. He also mentioned that he had been inquiring for a long time for a manufacturer who could provide a satisfactory equipment for heating the type plate of a box side branding machine. Suggestions had been made on one or two occasions, but not of a nature likely to prove satisfactory.

Mr. Cooke (Luton) urged the flat 4d, for all heating and

Mr. Cooke (Luton) urged the flat id. for all heating and cooking without any annual charge, and gave interesting figures from his own district in support of his contention that

figures from his own district in support of his contention that this was a paying business proposition.

Mr. Beauchamp (West Ham) referred with appreciation to the Chairman's method of preventing down draughts in public buildings, which he had also found to be successful and economical. He also drew attention to the use of electric heating stoves which consisted of a combination of radiant and convecting elements, pointing out that by the use of either or both features the maximum economy and comfort in heating rooms could be obtained. Referring to Mr. Cooke's remarks on heating in shops, Mr. Beauchamp drew attention to the fact that shop-heating in general could not be expected to have the same high diversity as domestic-heating, and whilst, like domestic-heating, it was to a great extent winter business, yet a large proportion of it might be expected to come on across the winter peak, a consideration the importance of which would, of course, vary with the undertaking supplying energy. supplying energy.

Mr. Tapper (Stepney) gave his experience that the maximum

supplying energy.

Mr. Tapper (Stepney) gave his experience that the maximum demand system met the requirements of nearly every class of consumer. One explanation was that, owing to his consumers being chiefly long hour users, they obtained low average rates. If he made any change in his tariff for domestic purposes to meet the cooking and heating business he should carefully consider, first of all, the two-rate meter system.

Mr. Long (Norwich) hoped to qualify before long for membership of the "Point Fives," and was seriously considering the adoption of this tariff. The point he was most concerned about was whether it was safe to give a flat rate of \$\frac{1}{4}d\$, for radiators used in shops without any addition to the fixed charge. He was satisfied that this could be done in the case of private houses as the diversity factor was very great, and comparatively few would be on at the peak, but in shops one would expect the majority to be in use then. He was interested to know from several speakers that in their experience the use of radiators in shops was, as a rule, reduced in the afternoon before the peak load. In Norwich the fixed charge for shops and business premises was based on the estimated maximum demand for lighting.

Mr. Shaw (Worcester) was very busy converting lamp heaters to hot-bar, which could be remodelled at a very small cost, thus converting them from obsolete appliances to quite up-to-date ones. Speaking on the life of cookers, he mentioned that some flour mills in Worcester had a cooker for baking and testing bread, which they had had in continual use for nearly 20 years. It was made by a Chelmsford firm.

Mr. Shaw stated that if an electric soldering iron, with cheap renewable elements, for industrial purposes could be put on the market, which would be satisfactory, and which he could recommend to his consumers, there would be a use for 900 to 1.000 in one canister factory alone.

The Hoy, Secretarry agreed that the domestic field pro-

recommend to his consumers, there would be a use for 900 to 1,000 in one canister factory alone.

The Hox, Sperkfary agreed that the domestic field provided a sufficiently large one for all the energies of the Association. All undertakings have a residential area as well as a business area, and, therefore, all stations had an interest in developing domestic supplies. Besides, electric power was well catered for already; it was almost standard and was extremely easily catered for, both as regards apparatus and tariffs. For premises other than residential he thought the Hopkinson tariff with an annual charge plus a small secondary rate per

unit met all the requirements, and he could not agree with the Chairman that shop lighting, hotels, etc., was a more difficult class to handle than the residential business. He was rather surprised no members had referred to the new method of heating rooms by thermostatic control. The effect of this would be largely to reduce the current consumption and put electric heating within the reach of many who could not afford it at present. He gave an example of a large thermostatically controlled electric hot water system which had been installed at Oxford Circus convenience for wash basins. The cost at present was slightly lower than for gas, and he could see his way to reducing the cost still further by at had been installed at Oxford Circus convenience for wash basins. The cost at present was slightly lower than for gas, and he could see his way to reducing the cost still further by at least 20 per cent. He mentioned a block of flats being erected in his district that were being cabled for heating, cooking and lighting by the builders. Electrically-heated hot water was also being installed, and the estimated consumption per annum of this block of flats was one million units, or 2,500 units per head of population. One was accustomed to looking to a block of flats of this size for 50 or 60 thousand units per annum as a maximum, and this example alone showed the per annum as a maximum, and this example alone showed the enormous field still untouched for domestic supplies.

BREAKDOWNS IN COLLIERY ELECTRICAL PLANT.

BY LLEWELLYN FOSTER.

(Abstract of paper read before the Association of Mining ELECTRICAL ENGINEERS (LANCASHIRE BRANCH)).

ELECTRICAL ENGINEERS (LANCASHIRE BRANCH)).

Generally speaking, breakdowns of mining electrical plant may be divided into three classes:—(1) Those caused by lack of proper attention and care, including want of systematic periodical opening out of the machines for inspection, cleaning and general overhaul. (2) Those due to the machines being quite unsuitable for their work and situation. In mining work particularly, open or protected-type machines are often used when they meet the requirements of the Regulations, whereas, on account of the surrounding dust and dampness, the enclosed type should have been used. (3) Those due to faulty design, defective material and workmanship.

It is very seldom that we find any system of periodically taking machines apart for overhaul; if the windings were kept clean and varnished occasionally, a number of breakdowns would be prevented. At one colliery in the north of England there are seven Hopkinson coal-cutters in use, and the machines are only allowed to work in the pit for three weeks continuously. After that period each machine is brought to the bank to be overhauled.

One of the most frequent sources of trouble in electrical plant in mines is due to the fact that a machine is left running as a single-phase owing to one of the three fuses having melted, or possibly to there being a defective circuit on one of the three phases. Fuses that are large enough for the starting current of a squirrel-cage motor are usually too large to be any real protection when the motor is running. It would seem, therefore, that having two sets of fuses and switching over from "starting" to "running" fuses would be a simple solution of this difficulty.

A considerable proportion of breakdowns occur in the commutating parts of continuous-current machines, viz., com-

be a simple solution of this difficulty.

A considerable proportion of breakdowns occur in the commutating parts of continuous-current machines, viz., commutators, brush-gear, etc., and sparking at these parts does not receive the careful attention it requires.

Fractured conductors, fractured commutator spokes, and flats on commutator bars are mostly due to vibration, and through consequent chafing and pounding of the insulating material "earth" faults are caused.

Regular measurements of the radial air gap should be taken and recorded, as well as the test of lifting the shaft in its bearings. Any movement in the bush or of the bush in its housing should be carefully observed. When the machine cannot be stopped, the condition of the bearing can be fairly well ascertained by inserting a pencil or rule in the oil well and letting it rest on the shaft, when any slackness will be noted by a movement of the pencil apart from the bearing housing or casting. The lighter the load the more positive will be the movement.

The switch blades and contacts of the stator circuit, and the fuse fittings and contacts require regular and systematic ex-

The switch blades and contacts of the stator circuit, and the fuse fittings and contacts require regular and systematic examination. All ends of cables, connections, etc., should be soldered to prevent the danger of the machine running on incomplete phases. When installing an "in-bye" motor, means should be provided for access to all parts of it. Some pits are naturally very wet, and breakdowns frequently occur through dampness percolating into the windings of the motors and to the starting gear. This causes "earthing" of the winding, and the trouble generally occurs at the end of the slots in the armature or rotor core. The percentage of breakdowns due to this cause would be considerably reduced by making properly constructed motor rooms, with the foundations laid out in such a manner that when the motor was installed on its bed it would be, say, 6in. or 8in. above the floor level. Breakdowns on underground plant are frequently due to bad foundations, etc., which set up excessive vibration. Many armature breakdowns are due to mechanical defects in the

driven machinery.

On some colliery plants where originally protected-type motors were installed, these have been converted into totally-

motors were installed, these have been converted into totallyenclosed machines, but without any reduction of the load.
The reduced rating of a motor when totally enclosed is often
lost sight of by the manager, who is usually responsible for
having the motor made totally enclosed.

In the earlier days of electrical work in collieries, a bed
built up of rolled-steel joists was fairly frequently met with,
but the cast-iron box bed has quite superseded it. In
cases where the rolled-steel joist beds are still in use it is important that they should be securely held down and well
grouted in. There should be a holding-down bolt close up
to each side of each bearing pedestal and each stator foot.
The greatest vigilance should be exercised to prevent any of
the bolts connecting the frame together from slackening back.
Care should also be taken that the steady pins go right through
the flange of the joist, and these steady pins should be frequently examined.

the flange of the joist, and these steady pins should be frequently examined.

Machine-cast steel wheels should always be used for the first reduction from the motor, and should have their pitch-circles marked so that they can be properly meshed. The use of "machine-moulded gearing" for such work as this is not likely to prove economical.

A 100-H.P. three-phase motor drove a haulage through gearing. The rotor and stator came into contact, and one coil in the stator was "earthed." The radial air gap was regularly measured twice a week by the colliery electrician; apparently it had not appreciably varied for many months, and on the day before the failure the gap was 0.03 in, at the smallest part. On investigation it was discovered that the motor had its greatest load when the pinion was running towards the spur wheel, thus tending to wear the top halves of the bushes. It is obvious, therefore, that a rotor may be perfectly central whilst at rest but not necessarily so when running. The makers should so design their end covers that the radial air gap can be watched whilst the machine is at work. The writer strongly recommends two "inspection doors" in the back end cover for every type and size of A.C. and D.C. motor, as this would very considerably aid in clean-special care and attention. A 100-H.P. three-phase motor drove a haulage through gear-,

TRADING AND INDUSTRIAL METHODS IN GERMANY.

Below are given some extracts from a report on the trade of

Germany by Sir Francis Oppenheimer, H.M. Commercial Attaché in Germany, which has recently been issued by the Government. The report itself may be obtained from Wyman and Sons (Cd. 7620-14, price 5½d.)

The Growth of Syndicates.—Germans, in every stage of society, are prone to combination; in Germany there is hardly a branch of manufacture or of trade, however special, which has not its own organisation and probably its own journal society, are prone to combination; in Germany there is hardly a branch of manufacture or of trade, however special, which has not its own organisation and probably its own journal. Manufacturers all over the Empire, producing the same goods, are brought into touch either personally or in print. The conditions of the whole home market are thus disclosed; its chances are weighed and scrutinised. The more a works specialises (and the tendency owing no doubt to the very keen home competition is all towards specialisation) the more must it co-operate with, and the more has it to rely upon, other branches of manufacture; their trade conditions have to be watched in turn. The specialist is brought into contact with the outside world. News from abroad is published and carried into distant workshops. The profusion of trade and professional papers can be gauged from their catalogue numbering 300 closely printed pages. That no branch is forgotten may be gathered from the fact that there figures among them a fortnightly magazine dealing with the interests of the foremen of platelaying gangs on the Prussian State railways (founded in 1906)! The keen competition among trade papers has produced a high standard. Much ingenuity and care is spent upon the reports of the industrial weather, with the result that no man need be taken unawares by a change of the tide.

Above all, it is the syndicates that exercise a steadying influence. This side of syndicaton has repeatedly been explained. Syndicates control production and sales, and, when the home market is satisfied, help towards directing merchandise abroad. In an atmosphere of industrial depression syndicates are seen to their greatest advantage—at least by their members. It is then not surprising that in 1913, and to a greater extent in the early months of 1914, syndication—the renewal of old syndicates and the foundation of new ones—should have been one of the most frequent subjects discussed in the commercial Press.

been one of the most frequent subjects discussed in the com-

mercial Press.

There is no doubt that after each successive boom the desire for syndication is strengthened and, at the same time, its accomplishment is rendered more difficult. The desire is strengthened because every boom gives the members of the various industries a chance of extending their works and raising their capacity of output—which means an increased production and, in consequence, an increased competition during a slump. In the first quarter of 1914 prices of unsyndicated goods reached what seemed to be the lowest possible limit. Yet the cry for syndication became louder as the depression

progressed.

progressed.

The difficulties of syndication are augmented because every boom gives a further advantage to the giant works which have virtually concentrated the various stages of manufacture under one roof. They have little interest in the various syndicates controlling the respective stages of manufacture unless they are granted preponderant figures of participation, more especially in the final stages. As the smaller works, whether syndicated or not, are greatly at the mercy of these giants, they naturally prefer a state of syndication which guarantees their existence, checks competition, secures steady prices in the home market, and provides export bounties for foreign orders. For the giant concerns, syndication means financial orders. For the giant concerns, syndication means financial sacrifices; but these sacrifices are expected of them as they are the princes of industry, the pillars of Germany's economic life. Their concerns have become world concerns. They embrace so many branches of manufacture, they command so many markets, that they reach above local industrial tides. The rise of such works, although it has been greatly assisted by the modern developments of German banking, is chiefly due to the application of science to manufacture. These due to the application of science to manufacture. These leaders have increased their profits by carrying the science of by-products to its utmost limits, and they have thus very materially reduced their cost of production. They are generous and indefatigable where scientific research is concerned. A succession of booms has made these mammoth concerns financially independent. cially independent.

Their Influence at Home.—The financial power to which they

have attained is used for, amongst other objects, the acquisition of their own means of transport. The reason is that all the world over the item of transport is gaining an additional importance in the faculty of competition. Some powerful mining-shipping combinations are an example of this develop-

The most recent development in the matter of concentration is perhaps the most interesting of all. To guarantee a steady sale of their vast output some of the big works began to effect a financial combination with their own consumers, thus following on an extensive scale an example set by the electrical industry. An important works, manufacturing machines for the problems has bought up a company letting out railway. industry. An important works, manufacturing machines for use on railways, has bought up a company letting out railway machinery; the firm of Krupp has bought up two shipbuilding yards; a leading factory producing electrical appliances and machinery has obtained control of an electrical power supply company.

These gigantic concerns exercise a steadying influence upon the country's economic life because their interests are world interests. Whatever the industrial tide may be at home, they are vast employers of labour; in many communities they are the backbone of local finance; together they contribute colossal revenues to the public funds. It is not unnatural, then, that such concerns obtain facilities from the Government which would be denied to the smaller fry. These privileges in turn strengthen their position and give them an additional lead. They obtain the aid of the diplomatic and consular service and the financial support of the banks, so much craved by our manufacturers. These gigantic concerns exercise a steadying influence upon

manufacturers.

manufacturers.

Effect on Export Trade.—The necessities of the German export trade have always enjoyed the special goodwill of the authorities. Under special export railway tariffs, practically all consignments below 5,000 kilos, and most consignments above, are carried to the coast or to the frontiers at reduced rates if intended for export. In some cases the rate is as low as 1.5 pfennig (4d.) per ton-kilom. As under the terms of these through tariffs the German export must be carried in the ships of certain German lines, they constitute, in addition to the indirect export bounties, also indirect shipping subsidies. Early in 1914 a new postal convention was signed between the German and Swiss authorities, granting additional facilities to the German-Swiss and German-Italian parcel post service; it will also indirectly benefit German consignments in post office parcels to Spain, South America, and the Dutch Indies.

The German exporter has gained considerable advantage

The German exporter has gained considerable advantage from the German shipping companies, who appear willing to initiate services with little prospect of profit in the immediate future. This policy accounts for the increasing proportion of trade directed to such smaller countries as Chile, Colombia. Siam, Morocco, the Philippines, Venezuela, Bolivia, Uruguay, etc. The North-German Lloyd was rumoured to be about to start a direct line from Germany to New Zealand. Again, manufacturers, merchants and shippers, interested in the same markets, have clubbed together to form special societies for nursing these markets so as to be able to lay their respective wishes with greater weight before the Imperial Government. Early in 1914, all these German foreign societies formed a union among themselves. The leading firms in certain German industries (metallurgical, electrical, chemical, construction) have become world institutions, with branches established, as separate companies, in many foreign parts; as witness the German-capitalised electrical concerns in Russia and in South America, where the D.U.E.G. is probably, with the exception of the Bagdad railway, the largest German foreign enterprise. From a mercantile point of view, there can be little doubt that so far the benefit which Germany has derived from The German exporter has gained considerable advantage

this private industrial colonisation outweighs the benefit which

this private industrial colonisation outweighs the benefit which she has derived from her political colonies.

Increased means of production, the price policy pursued by the syndicates, the difficulties of some of the finishing industries in the home market, will help to explain the record figures of the German export trade in 1913. It will help to explain also why there is hardly a report published by the various Chambers of Commerce throughout Germany which are the contain some remarks at the uncertificatory resident. does not contain some remark as to the unsatisfactory prices, the small profits, the price concessions which had to be made abroad to secure the necessary contracts. More particularly from the second half of 1913 onwards the necessity of a larger German export seemed uppermost in the public mind—the whole Press suddenly overflowed with articles of Germany's manufacture of the second half of economic mission abroad, of what is called Germany's Weltwirtschaft. Again and again it was pointed out that among the three leading industrial countries of the world Germany the three leading industrial countries of the world Germany found herself by a long way in the least favourable position. The United Kingdom had her vast colonial empire as a natural national market; the United States had a whole continent, while Germany, as the last comer, had no such privileged territories. As her colonies could, at best, be regarded in the light of future sources of supply for various raw materials, she must regard the world as her trading empire and rely exclusively upon her energies and enterprise to conquer it. Sometimes the limits were drawn somewhat more closely, and South America, Asiatic Turkey and the Chinese Empire were pointed to as her special trading areas.
